WILMOT PROVISIO-WILSON

WILMOT PROVISIO, wíl'mót prō-ví-zō, an amendment offered in the United States Congress by David Wilmot (q.v.), Aug. 8, 1846, pending the consideration of a bill placing \$2 million at the disposal of President James K. Polk to negotiate a peace with Mexico. The amendment, which was derived from the Northwest Ordinance, advocated the prohibition of slavery in any territory acquired from Mexico. It was adopted in the House in 1846, but the Senate adjourned without acting upon it. During the next session in 1847, the appropriation with the attached Proviso was again passed by the House and presented to the Senate where it was defeated primarily through the opposition of John C. Calhoun and other members of the Senate who advocated the extension of slavery in the South. A second appropriation of \$3 million without an amendment was passed instead.

Although the Proviso was never acted upon, it managed to pinpoint the sectional differences of the country, and subsequently laid the foundation for the Republican Party which adopted its principle concerning slavery. The amendment caused intense rivalries in the nation, and the issue involved became one of the main causes of the Civil War.

The reasons for submitting the Proviso are not entirely clear, but it was supported by those who feared the power of the South; by those who were opposed to slavery morally; by the disgruntled Democrats who felt the South had betrayed them concerning the Oregon boundary compromise; and by those who wished to oppose President Polk. Calhoun's opposition of the amendment was not unexpected, but his various resolutions maintaining that Congress had no say concerning the restriction of slavery in the territories increased Northern fears of the South and its motives.

WILSON, wíl'sən, **Alexander**, American ornithologist: b. Paisley, Renfrewshire, Scotland, July 6, 1766; d. Philadelphia, Pa., Aug. 23, 1813. He began working as a weaver's apprentice in 1779 and became a peddler in 1789. During this time he wrote many folk dialect poems, a volume of which, *Watty and Meg*, was published in 1792. Having also written a personal satire, Wilson was imprisoned for libel. Upon his release, he came to America. He taught school in Pennsylvania and New Jersey; became interested in ornithological work; and went on walking trips, which resulted in the publication of *The Foresters* (1805), a poem describing a journey to Niagara Falls.

At that time he was encouraged by William Bartram, the naturalist, and Alexander Lawson, the engraver, in his studies and drawings of North American birds. He wrote the classic, *American Ornithology*, seven volumes of which appeared between 1808 and 1813. Two subsequent volumes were edited posthumously by a friend of Wilson's, George Ord, and four others were published by Charles Lucien Bonaparte from 1825 to 1833.

WILSON, **Alexander**, Scottish astronomer: b. St. Andrews, Scotland, 1714; d. Edinburgh, Oct. 18, 1786. He studied at the University of St. Andrews and received his M.A. on May 8, 1733. In 1737 he became an assistant to an apothecary in London, and in 1742 he went back to St.

Andrews and started a letter foundry there. Wilson was appointed first professor of practical astronomy at the University of Glasgow in 1760, and in 1774 he published his unusual discovery pertaining to sunspots in *Philosophical Transactions* of the Royal Society of London. He maintained that sunspots are depressions in the matter surrounding the sun, and he proved his theory by a process of induction. Wilson was noted for his scientific investigations and for his work on the production and improvement of printing types.

WILSON, **Charles Edward**, American industrialist and government official: b. New York, N.Y., Nov. 18, 1886; d. Bronxville, N.Y., Jan. 3, 1972. In 1899 he joined the shipping office of the Sprague Electrical Works, New York City. This organization became a subsidiary of the General Electric Company in 1903, Wilson continuing with the company and rising through various departments to become merchandising manager and vice president (1930-1937). He was executive vice president from 1937 to 1939 and president in 1940-1942 and 1944-1950.

From 1942 to 1944 he served first as vice chairman and then as executive vice chairman of the War Production Board. He had charge of production scheduling for the war effort and procured materials for the atom bomb project. He resigned because he felt reconversion policies were being carried out too rapidly.

From December 1950 to March 1952 he was director of the Office of Defense Mobilization. As head of the defense program of the United States he urged adoption of price and wage controls to achieve economic stabilization. He resigned this post because of disagreement with President Harry S. Truman over settlement of a wage dispute in the steel industry.

WILSON, **Charles Erwin**, American industrialist and public official: b. Minerva, Ohio, July 18, 1890; d. Norwood, La., Sept. 26, 1961. He graduated from Carnegie Institute of Technology in 1909 as an electrical engineer. In the same year he began his career as an engineer with the Westinghouse Electric and Manufacturing Company, Pittsburgh, Pa. In 1912 he designed the company's first automobile starting motor. From 1919 to 1926 he was chief engineer and factory manager for the Remy Electric Company, a General Motors subsidiary. Upon the reorganization of this company as the Delco-Remy Corporation, he became president and general manager, serving until 1929.

From 1929 to 1939 he was vice president of General Motors Corporation, concentrating on labor relations and production planning. Becoming president of the organization in 1941, he was one of the United States' leading defense production organizers during World War II. In 1947 he was author of the so-called "escalator" wage formula, a cost-of-living pay plan accepted by the automobile workers' union in 1948 as part of a five-year contract.

Wilson was named secretary of defense by the president-elect, Dwight D. Eisenhower, in 1952 and took office on Jan. 28, 1953. Holding office during a period of growing concern over the state of American military strength, he often faced criticism and was known for his bluntness in controversy. He stayed in the cabinet into the president's second term, resigning in 1957.

WILSON, Charles Thomson Rees, Scottish physicist: b. Glencorse, Midlothian, Scotland, Feb. 14, 1869; d. Carlops, Peeblesshire, Nov. 15, 1959. Educated at Owens College (Manchester) and Sidney Sussex College (Cambridge) in England, he was professor of natural philosophy at Cambridge University from 1925 until his retirement in 1934. Beginning in 1895 he studied the condensation of tiny drops of water on gaseous ions, the properties of ionized particles, and the nature of atmospheric electricity. For his invention of the Wilson cloud chamber (q.v.), an instrument which made it possible to track electrons, and other subatomic particles, Professor Wilson (together with Professor Arthur H. Compton of the United States) was awarded the 1927 Nobel Prize in physics.

WILSON, Edmund, American critic and writer: b. Red Bank, N. J., May 8, 1895; d. Talcottville, N. Y., June 12, 1972. He graduated from Princeton in 1916, worked as a reporter in New York City, and served in the Army during World War I. In 1920-1921 he was managing editor of *Vanity Fair*. In 1926 he became book review editor of the *New Republic*, of which he had become associate editor by 1931, when he resigned to give more time to his writing, but remained a contributing editor. In the same year he published *Axel's Castle*, which was to become a standard text in the field of literary criticism as an analysis of the symbolist movement. Other subsequent works, such as *The Triple Thinkers* (1938), *The Wound and the Bow* (1941), and *The Shores of Light* (1952) brought further fame to Wilson as a critic. From 1944 to 1948 he served as book reviewer for the *New Yorker* magazine.

Besides poetry (*Poets, Farewell!*, 1929), a novel (*I Thought of Daisy*, 1929), plays (*Five Plays*, 1954), and short stories (*Memoirs of Hecate County*, 1946), Wilson also wrote about political matters. *Travels in Two Democracies* (1936) and *To the Finland Station* (1940) concern European revolutionary movements.

Some of Wilson's other work, such as *The Scrolls from the Dead Sea* (1955), has been very popular, but it is as a critic that he is most famous. *Patriotic Gore* (1962) concerns the literature of the American Civil War.

Wilson was awarded the Presidential Medal of Freedom in 1963, the National Medal for Literature in 1966, and the Aspen Award in 1968. A book of memoirs, *Upstate: Records and Recollections of Northern New York*, appeared in 1971.

WILSON, Edmund Beecher, American zoologist: b. Geneva, Ill., Oct. 19, 1856; d. New York, N.Y., March 3, 1939. Graduated from the Sheffield Scientific School at Yale University in 1878, he continued his studies at Johns Hopkins University and later in England, Germany, and Italy. In 1885 he was named professor of biology at the newly founded Bryn Mawr College in Pennsylvania. He joined the faculty of Columbia University six years later, and was Da Costa professor of zoology there from 1909 until his retirement in 1928. Beginning with studies in embryology, Wilson's researches extended to pioneer investigations in the field of cytology, leading to the publication of his classic work, *The Cell in Development and Inheritance* (1896, 3d ed. rev., 1925). He played a major part in promoting the theories of Gregor Mendel.

WILSON, Halsey William, American bibliographer and publisher: b. Wilmington, Vt., May 12, 1868; d. Yorktown Heights, N.Y., March 1, 1954. Educated at the University of Minnesota, he opened a bookstore at Minneapolis in 1889. Lacking a convenient bibliography of the American book trade, he initiated the *Cumulative Book Index* in 1898. This grew into a list of books in the English language, arranged alphabetically by author, title, subject, editor, translator, illustrator, and series in a single combined list. A new list was issued monthly, and these lists were periodically cumulated.

This trade bibliography was the foundation of the H.W. Wilson Company as the major bibliographical publisher in America. It was followed by a series of periodical indexes, beginning with *Reader's Guide to Periodical Literature* (1901) and extending to special subject indexes, and by other essential reference tools.

Wilson's major innovations in bibliographic publishing were his consistent cumulation of entries and his "service basis" for pricing. The service basis consisted of a sliding price scale for his bibliographies and indexes. Libraries with large collections and substantial book budgets paid higher prices than small libraries.

HOWARD W. WINGER.

WILSON, Sir Harold (1916–), British prime minister from 1964 to 1970 and again from 1974 to 1976. James Harold Wilson was born on March 11, 1916, in Huddersfield, Yorkshire. He was educated at Wirral Grammar School and at Jesus College, Oxford University. After a brilliant undergraduate career, he went to Oxford's New College in 1937 as a lecturer in economics.

On the outbreak of World War II, he joined the civil service, and in 1943-1944 he served as director of economics and statistics in the ministry of fuel and power.

Although he had been a Liberal in his undergraduate days, Wilson turned to the Labour party as a result of his work on problems of unemployment and his contacts with the Fabian Society, an organization devoted to achieving socialism gradually. He was nominated as a Labour candidate for Parliament in 1944 and resigned from the civil service. Back at New College, he combined his research and practical experience in a book, *New Deal for Coal* (1945). He was elected to Parliament that year and was immediately included in the new Labour government, serving as parliamentary secretary to the ministry of works (1945-1947), secretary for overseas trade (1947), and president of the board of trade (1947-1951).

During the period 1945 to 1950, Wilson was regarded as a "right-wing ally" of the Labour leadership. In 1951 he resigned from the government because of cuts in welfare expenditure, and after the Labour party's defeat that year, he joined a left-wing group headed by Aneurin Bevan that opposed the leadership of Clement Attlee and, later, of Hugh Gaitskell. In 1960, Wilson challenged Gaitskell for the party leadership. Although he was defeated, his reputation survived, and he won the leadership election in 1963, after Gaitskell died.

Labour's victory in 1964 installed Wilson as prime minister. In 1966, in a bid to increase his party's slim margin in the House, Wilson called for new elections, and this time Labour won a commanding 97-seat majority. He suffered

KARSH/WOODFIN CAMP

Sir Harold Wilson, British statesman and leader of the Labour party, was twice Britain's prime minister.

an unexpected electoral defeat in 1970, but, although losing office to the Conservatives, retained authority within his own party. Labour's narrow victory at the polls in February 1974 enabled Wilson to return as head of a minority government.

On March 16, 1976, Wilson surprised the nation by resigning. He had served as party leader for 13 years and as prime minister for nearly 8 years. On April 22, 1976, Queen Elizabeth II named him a Knight of the Garter.

WILSON, Henry, American political leader, who was vice president of the United States from 1873 to 1875: b. Farmington, N.H., Feb. 16, 1812; d. Washington, D.C., Nov. 22, 1875. His name, originally Jeremiah Jones Colbath, was legally changed in 1833. As a young man he operated a shoe factory at Natick, Mass., and was elected to the lower house of the Massachusetts legislature in 1840.

An opponent of slavery, Wilson left the Whig party, moving first to the Free Soil party and then to the new Republican party, which he helped organize. Wilson represented Massachusetts in the U.S. Senate from 1855 to 1873. During the Civil War he headed the important Senate committee on military affairs, and after the war he took a prominent part in reconstruction measures favoring full civil and political rights for Negroes. Elected vice president with Ulysses S. Grant in 1872, Wilson suffered a stroke in 1875 and died in office.

WILSON, Sir Henry Hughes, British army officer: b. Edgeworthstown, County Longford, Ireland, March 5, 1864; d. London, England, June 22, 1922. Commissioned in 1884, he saw active service in Burma and the South African War. He was commandant of the Army Staff College from 1907 to 1910. Thereafter he was director

of military operations until the outbreak of World War I in 1914 when he went to France as assistant chief of staff to Sir John Denton Pinkstone French. He was later a corps commander, then chief liaison officer with the French supreme command; and after a period in Britain commanding the Eastern division, he visited Russia in 1916 with the mission headed by Lord Alfred Milner. In 1917 Wilson returned to France as British military representative on the newly established Supreme War Council, and the next year he became chief of the British general staff. With the war's end he was promoted field marshal and created baronet, and after leaving the army in 1922, he was elected member of the House of Commons for North Down, Ireland. His advocacy of strong measures in Ireland against the Sinn Fein, an Irish nationalist organization, resulted in his assassination by two members of the Sinn Fein.

WILSON, Henry Maitland, 1st Baron Wilson of Libya and of Stowlangtoft, British army officer: b. Stowlangtoft Hall, Suffolk, England, Sept. 5, 1881; d. Aylesbury, England, Dec. 31, 1964. He served in the South African War and World War I, and rose through the grades to become brigadier in 1934. The following year, promoted to major general, he commanded Britain's first fully mechanized brigade; and in 1939, with the rank of lieutenant general, he was sent to Egypt to command the Army of the Nile. In 1940, after France's surrender in World War II, he directed the operations which extended the British front into Libya, and early in 1941 became military governor of Cyrenaica. He was shortly sent from North Africa to Greece and, following the evacuation of British troops from that country, he was given command of the forces in Palestine and Transjordan. Promoted full general, late in 1941 he conducted a five-week campaign in collaboration with Free French forces which resulted in the capture of Damascus and retention of Syria for the Allied cause.

Early in 1942 he was appointed commander in chief of the new Iran-Iraq Command, responsible for guarding one flank of the Suez Canal, and in February 1943, he replaced Gen. Sir Harold R. L. G. Alexander as commander in chief of the Middle East. In 1944 he became supreme allied commander in the Mediterranean theater in succession to Gen. Dwight David Eisenhower. He was also named to supreme command in western Europe, and in this capacity he directed the campaign in Italy. He was promoted to the rank of field marshal in 1944, and from 1945 to 1947 he was in Washington, D.C. as head of the British joint staff mission. In this post he was the senior British member of the combined chiefs of staff, an Anglo-American organization which was not dissolved with the termination of World War II. In recognition of Wilson's services he was knighted in 1940 and created baron in 1948. He is author of *Eight Years Overseas, 1939-1947* (1950).

WILSON, James, American statesman and Supreme Court justice: b. Carskerdo, Scotland, Sept. 14, 1742; d. Edenton, N.C., Aug. 21, 1798. Educated at the universities of St. Andrews, Glasgow, and Edinburgh, he arrived in New York City in 1765. The next year he moved to Philadelphia, Pa., taught Latin at the College of Philadelphia, and studied law. He was admitted to the bar in 1767.

In 1774 he was a delegate to the First Continental Congress. In 1774 he distributed what was to become an extremely important manuscript, *Considerations on the Nature and Extent of the Legislative Authority of the British Parliament*. In this publication Wilson maintained that the British Parliament had absolutely no power over the colonies, which were bound to England only by the authority of the king. Each colony, he went on to say, was a separate and independent self-governing unit. This Federalist doctrine was in advance of the political theories of the day.

In 1775 Wilson was a member of the Pennsylvania Provincial Congress, where he made a speech asserting the possibility of an unconstitutional act by Parliament. This idea was the forerunner of the American policy of judicial review. Later in the same year he was elected to the Second Continental Congress, which met for the purpose of accepting the necessity for war and the Declaration of Independence, of which he was a signer. Wilson, belonging as he did to one of the Middle States, where opinions differed sharply about the situation, was reluctant at first to declare independence. However, his vote broke the deadlock of the Pennsylvania delegation, and Pennsylvania voted for independence.

Wilson was a member of the Continental Congress until 1777 and again in 1783 and 1785-1786. He exerted great influence at the Constitutional Convention of 1787, which assembled for the purpose of writing a constitution that would safeguard the individual states and yet provide a system of authority between the central government and the separate states. Wilson was an important member of this distinguished group, which went far beyond its original purpose of revising the Articles of Confederation, and created the Constitution of the United States. At this time Wilson was the only man who urged election of senators by the direct vote of the people rather than by state legislatures. His belief in natural rights, a doctrine maintaining that sovereignty rests in the individual rather than in government, is reflected in the measures he suggested at this time. He signed the Constitution and fought for its adoption at the Pennsylvania ratifying convention. He became the first professor of law at the University of Pennsylvania in 1789, and in the same year was appointed to be one of the first associate justices of the Supreme Court of the United States. His involvement in land speculation caused him financial difficulties, and he was jailed for his debts. He served on the Supreme Court until his death in 1798.

WILSON, James Falconer, American lawyer and politician: b. Newark, Ohio, Oct. 19, 1828; d. Fairfield, Iowa, April 22, 1895. In 1852 he moved to Fairfield with his family, where he practiced law. He served in both houses of the Iowa state legislature, becoming president of the Senate in 1861. He was a member of Congress from 1861 to 1869 where, as chairman of the judiciary committee he vigorously supported anti-slavery measures. In 1868 he was one of the managers of the impeachment proceedings against Andrew Johnson, on the grounds that Johnson failed to abide by the acts of Congress. From 1862 until his death, Wilson was a member of the United States Senate. He sponsored the original package act in 1890, which provided state control of liquor transportation.

WILSON, James Harrison, United States army officer: b. Shawneetown, Ill., Sept. 2, 1837; d. Wilmington, Del., Feb. 23, 1925. Graduated from West Point in 1860, he joined the engineer corps, and following the outbreak of the Civil War the next year, he took part in the Battle of Port Royal Bay. He also participated in other major Civil War campaigns such as Antietam, Chattanooga, the Wilderness, Shenandoah, and Nashville. In March 1865, he made a raid into Alabama and Georgia, capturing Selma, Montgomery, Columbus, and Macon in 28 days, as well as capturing Jefferson Davis. He resigned from the army in 1870, but he decided to join again at the outbreak of the Spanish-American War in 1898. He served as second in command during the Boxer Rebellion in China. Wilson retired for a second time in 1900, having achieved the rank of brigadier general. Among his publications are biographies of Ulysses Grant (with Charles Anderson Dana, 1868), and Charles Anderson Dana (1907).

WILSON, John (pseudonym: CHRISTOPHER NORTH), Scottish author: b. Paisley, Scotland, May 18, 1785; d. Edinburgh, April 3, 1854. He was educated at Glasgow University and Magdalen College, Oxford. At the time of his graduation in 1810, Wilson had come into a considerable amount of money. He subsequently retired to a property he had purchased at Elleraay on Windermere to live as a country gentleman, writing poetry.

In 1812 Wilson published the once-famed *Isle of Palms*; another poem in dramatic form, *The City of the Plague* (1816), was still more successful, but is now forgotten. In 1815, however, he lost his fortune through the fraudulent speculation of an uncle, and in 1817, together with John Gibson Lockhart, became connected with *Blackwood's Magazine*. This Tory-slanted and intellectually aggressive magazine gained great popularity. Among Wilson's many articles printed in this journal was his renowned *Noctes Ambrosianae*, a series of conversations on a number of general subjects including literary, political and philosophical issues, written as though they had taken place between contributors to *Blackwood's* at convivial meetings in Ambrose's Tavern, Edinburgh. The articles in this series first appeared in 1822, and from 1825 to 1835, when they ended, were written almost solely by Wilson.

In 1820 Wilson obtained the chair of moral philosophy in the University of Edinburgh, a post for which he had few qualifications, but which he nevertheless filled with credit for 31 years. An incomplete edition of his works, edited by J. F. Ferrier, was published in 12 volumes (Edinburgh 1855-1858). In addition, he published a complete edition of the *Noctes Ambrosianae*, edited by R. S. Mackenzie, in five volumes (New York 1866).

WILSON, Robert, English comic actor and playwright: d. 1600. The place and date of his birth are unknown. He was one of the actors who comprised the earl of Leicester's company when it was formed in 1574, and soon made a reputation as a comedian equal or second only to Richard Tarlton. Wilson was famous for his ability to extemporize, and his ready and facile wit. From 1583 to 1588 he was one of the 12 players who comprised Queen Elizabeth's com-

pany, and afterward joined the lord chamberlain's company, of which William Shakespeare also became a member.

The three morality plays—a genre of drama which personifies vices and virtues—generally assigned to Wilson are: *Three Ladies of London* (1584); *The Pleasant and Stately Morall of the Three Lordes and Three Ladies of London* (1590); and *The Cobblers Propheste* (1594). One episode of the *Three Ladies of London* concerns a Jewish creditor attempting to recover a debt from an Italian merchant, undoubtedly a forerunner of Shakespeare's *Merchant of Venice*.

WILSON, Samuel ("UNCLE SAM"), American patriot and merchant: b. Menotomy (now Arlington), Mass., Sept. 13, 1766; d. Troy, N.Y., July 31, 1854. His father, Edward Wilson, and older brothers, Joseph and Edward, Jr., fought in the American Revolution. Sam himself ran away from home at the age of 14 to enlist in the American Army and served until the end of the war. At 23, almost penniless, he moved to Troy, N.Y., where in 1790 he began a meat-packing business. By dint of hard work he took root in the community and became known for his honesty and common sense. By the beginning of the War of 1812, Wilson had become prominent in New York State, and in September 1812 he was made inspector of provisions for the United States Army in New York and New Jersey. A group of visitors to his plant in Troy on Oct. 2, 1812, including Gov. Daniel D. Tompkins of New York, asked what the initials "EA-US" on the barrels of meat stood for. A workman replied that "EA" stood for Elbert Anderson, Jr., the contractor for whom Wilson worked, and added jokingly that the "US" (actually an abbreviation for "United States") stood for "Uncle Sam" Wilson. An eyewitness account of this incident was recorded by the former Congressman Theodorus Bailey, then postmaster of New York City and one of the group of visitors, in the May 12, 1830, issue of the *New York Gazette and General Advertiser*. The allusion caught on rapidly, for Wilson was popular and seemed to epitomize the plain American—honest, self-reliant, and devoted to his country. By the close of the War of 1812 the sobriquet "Uncle Sam" had come to symbolize the national character and the government. In 1961 Congress adopted a resolution saluting "Uncle Sam" Wilson of Troy, N.Y., as "the progenitor of America's national symbol." Wilson is buried in Oakwood Cemetery in Troy.

THOMAS I. GERSON.

WILSON, Samuel Alexander Kinnier, British neurologist: b. Cedarville, N.J., Dec. 6, 1877; d. London, England, May 12, 1937. His father was an Irish clergyman temporarily living in New Jersey. Wilson was educated at Edinburgh University, and following his graduation in 1903, studied in Paris (1903-1904), and in Leipzig, and in 1904 became resident medical officer at the National Hospital for the Paralyzed and Epileptic in London. He was associated with this institution until his death, and was junior neurologist at King's College Hospital from 1919; senior neurologist there, from 1928. Wilson's disease, or Wilson's syndrome, is a name given to hepatolenticular degeneration, a progressive degeneration of the lenticular nucleus of the brain associated with cirrhosis of the liver, which he described in 1912.

Wilson was a brilliant writer, theoretician, and teacher. He was a member of neurological societies throughout the world. In 1920 he founded and became the first editor of the *Journal of Neurology and Psychopathology*. His published works include *Aphasia* (1926); *Modern Problems in Neurology* (1928); and *Neurology*, edited by Alexander Bruce, 2 vols. (1940).

WILSON, Thomas Woodrow. See WILSON, WOODROW.

WILSON, William Bauchop, American labor leader and public official: b. Blantyre, Scotland, April 2, 1862; d. Savannah, Ga., May 25, 1934. He accompanied his family to the United States in 1870 and in the next year, at the age of nine, went to work in the coal mines at Arnot, Tioga County, Pa. In the 1880's and 1890's he was often forced into other work due to his ardent unionism. From 1888 to 1890 he was president of the district miners' union, and in the last-named year was one of the founders of the United Mine Workers of America, which he served as secretary-treasurer from 1900 to 1908. He was active in the coal strikes of 1899 and 1902.

In 1907 he was elected to the House of Representatives as a Democrat, serving until 1913, when he was appointed to President Woodrow Wilson's cabinet as the nation's first secretary of labor. While in Congress, Wilson was chairman of the House committee on labor and helped to organize the federal Bureau of Mines in 1910. As secretary of labor he made significant contributions in the field of labor welfare, methods of mediation, and collective bargaining.

WILSON, William Lyne, American legislator and educator: b. Middleway, Va. (now in West Virginia), May 3, 1843; d. Lexington, Va., Oct. 17, 1900. He graduated from Columbian College (now George Washington University), Washington, D.C., in 1860, and studied at the University of Virginia until 1861, when he enlisted in the Confederate cavalry, with which he served throughout the Civil War. From 1865 to 1871 he was assistant professor of ancient languages at Columbian College where he studied law simultaneously. He was admitted to the bar in 1869, and in 1871 began practicing at Charles Town, W.Va.

Wilson was president of the University of West Virginia from 1882 to 1883, and from 1883 to 1895 was a member of the House of Representatives, distinguishing himself as a leader in the movement to reduce tariffs, which resulted in a tariff reform bill in 1894. This Wilson tariff bill provided for the free importation of wool and other commodities, and levied an income tax, but the bill was so changed and weakened in the Senate due to the influence of tariff lobbyists that President Grover Cleveland let it become law without signing it.

Following his defeat for reelection in 1894, Wilson was appointed postmaster general by President Cleveland. He served in this position from 1895 to 1897, during which time he inaugurated rural free delivery and made other improvements in the postal system. A firm believer in the gold standard, he vigorously opposed William Jennings Bryan in 1895-1896. From 1897 until his death Wilson was president of Washington and Lee University.

WILSON, (Thomas) Woodrow, 28th president of the United States; b. Staunton, Va., Dec. 28, 1856; d. Washington, D.C., Feb. 3, 1924. He was the son of Joseph Ruggles Wilson, who was the pastor of the Presbyterian Church in Staunton, Va. The elder Wilson accepted a call to Augusta, Ga., in 1857. "My earliest recollection," Woodrow Wilson said long afterward, "is of standing at my father's gateway in Augusta, Georgia, when I was four years old, and hearing someone pass and say that Mr. Lincoln was elected and there was to be war." Joseph Ruggles Wilson, a strong southern sympathizer even though he had grown up in Ohio, was a chaplain in the Confederate Army. His son saw only the backwash of war, but he never forgot its terror or the lessons that it taught.

Early Life and Manhood, 1870-1902.—The Wilsons moved to Columbia, S.C., in 1870, when Dr. Wilson accepted a professorship at the Columbia Theological Seminary. Columbia was still partly a burned ruin, and Radical Republicans ruled in the state capitol. But life was remarkably normal for the growing boy. He learned much from his brilliant father, continued his schooling, and joined the church in 1873. The following autumn he entered Davidson College in North Carolina. Because of illness Wilson stayed with his family in Wilmington, N.C., to which they had just moved, during 1874 and part of 1875. In September 1875 he entered the College of New Jersey, now Princeton University. He was a conscientious if not brilliant student (he stood midway in his class), and he read widely in the classics and fell in love with history. An ardent debater, he also wrote for college magazines.

Having resolved to become a "statesman," Wilson entered the Law School of the University of Virginia in the autumn of 1879, but had to withdraw after a physical breakdown in December 1880. After study at home, he opened a law office in Atlanta in June 1882. Admitted to the bar a few months later, he did not prosper. In despair he entered the Johns Hopkins University in Baltimore in September 1883 to prepare himself for a career in teaching. Among a remarkable group of scholars Wilson did distinguished work, and wrote his first book, *Congressional Government* (1885), analyzing the weaknesses of leadership in the American constitutional system. This was his dissertation for the doctor's degree which was awarded him in 1886. On June 24, 1885, he married Ellen Louise Axson in Rome, Ga. It was a happy marriage blessed by three daughters.

Wilson accepted an associate professorship of history at Bryn Mawr College near Philadelphia in 1885. He was not happy at this woman's college, and he accepted a professorship at Wesleyan University in Connecticut in 1888 with an alacrity that betrayed his yearning for a "class of men." At Wesleyan he was an immediate success. He published a major work in comparative government, *The State*, in 1889 and coached one of the most successful football teams in Wesleyan's history. But he could not refuse the call to a professorship from Princeton when it came in 1890.

Everything seemed to work together to make the 12 years of Wilson's professorship at Princeton a time of rich fulfillment. He grew notably in scholarly maturity, publishing *Division and Reunion* (1893), a pioneer study of the American Civil War; his largest work, *History of the Ameri-*

can People (1902); and other books and essays as well. He was a regular lecturer at Johns Hopkins during most of this period, and at least seven times he was offered the presidency of universities. As a teacher and faculty colleague he was an unrivaled success. When the trustees of Princeton virtually deposed the president, the Reverend Dr. Francis L. Patton, in 1902, they turned unanimously to Wilson. He was the first layman ever chosen to the presidency of the university.

President of Princeton University, 1902-1910.—Wilson was inaugurated with becoming pomp at Princeton on Oct. 25, 1902. He was a striking figure in his gown. His height and build were average, but his rectangular face, with its jutting jaw and flashing eyes, radiated power and reflected quick intelligence. In his mature personality Wilson was at once simple and complex. He had a quick and orderly mind and a rare ability to cut through the maze of details to the essence of a subject. Among his family he was affectionate, and went far beyond the call of duty in supporting and helping to educate indigent kinsfolk. He was utterly dependent upon love and friendship, but he perhaps demanded too much of friends and did not take lightly what he regarded as betrayal of trust. But throughout his life he drew his greatest strength from the resources of Christian faith. A Presbyterian elder, he had a superb command of Reformed theology, read the Bible daily, and attended divine services regularly. It was no accident that he never thought about public matters, as well as private ones, without first trying to decide what faith and Christian love commanded in the circumstances.

All his adult life Wilson had been fascinated by the problems of leadership in the American and British political systems. Now he resolved to lead trustees and faculty in a drive to make "in fact a great university" out of a run-down college. First came a radical change in the method of instruction with the addition of some 50 young scholars to launch what Wilson called the preceptorial system. It supplemented course lectures with discussion conferences conducted by preceptors. At the same time, Wilson took the lead in thoroughgoing reorganization of the university's curriculum. Completed in 1904, it assured considerable integration of fields of study without, however, denying some choice to undergraduates. Along with these changes went a noticeable improvement in academic standards.

From 1906 to 1907 Wilson moved to his next objective: the reorganization of undergraduate social life, by proposing to abolish upperclass eating clubs, which had become centers of college activity; and to group students in residential quadrangles, each with its dining hall, common room, and faculty fellows. Although Wilson did not attack the clubs in their most vulnerable spot—their reputation for exclusiveness—he evoked such violent opposition from alumni and students that the trustees quickly withdrew the approval they had tentatively given. Wilson did not take defeat meekly. He nearly resigned when a committee of the trustees buried the quadrangle plan in a final report early in 1908.

The next two years were marked by increasing turmoil at Princeton. The ostensible issue was the location of a new graduate college. The dean of the Graduate School, Andrew F. West, wanted to build the college at some distance from the campus; Wilson insisted that it should be located in the center of the university. The real cause of

conflict was personal antagonism, and Wilson was right in thinking that West meant to build his own empire. In 1909 Wilson persuaded the trustees to decline one gift of a graduate college to be built on West's terms. But he was helpless when an alumnus died in 1910, leaving between \$2 to \$4 million to carry out West's plans.

Governor of New Jersey, 1911-1913.—In the spring of 1910, Col. George Harvey, editor of *Harper's Weekly*, persuaded James Smith, "boss" of the New Jersey Democratic Party, to support Wilson for the gubernatorial nomination. In despair over West's recent triumph, Wilson agreed to accept the nomination if it were offered without conditions. Smith's well-oiled machine worked perfectly, but his plan to elect a dignified puppet soon went awry. Wilson accepted the Democratic state convention's nomination, aligned himself with the progressive forces that had been fighting Smith, and won in a landslide on Nov. 8, 1910. It was only the beginning of the revolution. Before his inauguration Wilson prevented Smith's election to the United States Senate by the state legislature. Inaugurated on Jan. 17, 1911, the new governor maintained such heavy pressure on the legislature at Trenton that he won enactment of most of his program in one session: direct primaries; effective state regulations of public utilities; workmen's compensation; municipal reform; and reorganization of the school system. In early 1913 he won the last of his important demands—antitrust legislation to drive industrial monopolies from New Jersey.

These triumphs made Wilson a leading contender for the Democratic presidential nomination in 1912. He worked hard, but his cause seemed hopeless when the Democratic national convention opened in Baltimore, Md., on June 25, 1912. Champ Clark of Missouri, speaker of the House of Representatives, commanded nearly a majority of the delegates, while Representative Oscar W. Underwood of Alabama had drawn off some 100 delegates who would otherwise have gone to Wilson. Clark achieved a majority on the 10th ballot, but not the necessary two thirds, when Tammany swung New York into his column. On the 14th ballot, William Jennings Bryan, Democratic leader from Nebraska, switched his vote from Clark to Wilson. This dramatic move did not turn the tide, but Wilson gained slowly. He won the nomination on the 46th ballot with the help of the Underwood men.

The ensuing presidential campaign was filled with excitement and drama. President William Howard Taft, the Republican nominee, had no chance and knew it. But Theodore Roosevelt, who had entered the race at the head of the third-party Progressive ticket, campaigned with great vigor. He called for a New Nationalism looking toward sweeping extension of federal regulation and welfare activity. Wilson countered with what he called the New Freedom—a program to liberate American economic energies by drastic tariff reduction, strengthening of anti-trust laws and reorganization of the banking and credit system. Wilson won 435 electoral votes out of 531, and carried a Democratic Congress into office on Nov. 5, 1912, but he polled only 42 percent of the popular vote.

The New Freedom, 1913-1914.—It was not easy for the leader of a party that had been out of power for 20 years to build an administration from the ground up. The chief cabinet post, the secretaryship of State, went to Bryan. The ap-

pointment of other party regulars signified that Wilson would work through established machinery instead of a bipartisan progressive coalition. However, Wilson lost no time after his inauguration on March 4, 1913, in demonstrating that he meant to use all his power as president and party leader. He called Congress into special session to redeem his first promise of tariff reform. Appearing in person before a joint session on April 8, he broke a century-old precedent and emphasized his determination to lead in legislation. The battle that followed was the crucial test of Wilson's domestic leadership. A tariff reform bill, sponsored by Representative Underwood, passed the lower house easily enough, but dangers in the Senate threatened emasculation if not defeat of the Underwood bill. Just when it seemed that it would go the way of earlier tariff reform measures, Wilson launched a bold attack—by charging that an industrious and insidious lobby was trying to defeat honest tariff legislation. Democratic opposition in the Senate melted. The Underwood Act, approved Oct. 3, 1913, was the first tariff legislation uninfluenced by special interests since the Civil War. It greatly enlarged the free list, reduced general rates from a level of about 40 percent to 26 percent, and imposed the first income tax under the 16th Amendment.

Meanwhile, Wilson had already begun his campaign for badly needed currency and banking reform. Working with Representative Carter Glass of Virginia, the president hammered out the Federal Reserve bill. It established 12 Federal Reserve banks to perform central banking functions. Coordinating and controlling the entire system was a Federal Reserve Board of presidential appointees. The measure also created a new currency, Federal Reserve notes, issued by Federal Reserve banks against gold and commercial credits. The House approved the bill on Sept. 18, 1913, but Wilson won Senate approval on December 19 only after a hard fight against private banking interests.

Only antitrust reform remained to complete the New Freedom program. At the outset of the debate over proposals in early 1914, Wilson still thought that clarification of the Sherman Act would suffice. But he was soon persuaded to adopt another solution. He lost interest in his first measure, the so-called Clayton Antitrust bill. However, Congress approved it, with a meaningless amendment saying that labor unions were not illegal combinations in restraint of trade; and Wilson signed the measure on Oct. 15, 1914. Meanwhile, he had concentrated on his new solution, the Federal Trade Commission bill. It outlawed "unfair" trade practices in sweeping terms, and created a Federal Trade Commission to issue "cease and desist" orders to prevent unfair competition. This measure, which heralded a new era of governmental regulation, received Wilson's signature on Sept. 26, 1914.

Foreign relations were a constant source of perplexity during Wilson's first two years in office. Both he and Secretary Bryan hoped to inaugurate a new foreign policy of helpfulness. They signed treaties with 30 nations providing for investigation of disputes that might lead to conflict. But goodwill alone did not suffice to settle other problems. They negotiated a treaty with Colombia to repair the damage done by Theodore Roosevelt's complicity in the Panamanian revolution of 1903, only to have the treaty rejected by the Senate. They were unable

to persuade the California legislature to avoid insult to Japan in legislation to prevent Oriental ownership of land. In Nicaragua, Haiti, and the Dominican Republic they pursued policies of helpfulness that led, in the case of the last two countries, to forcible military occupation in 1915 and 1916.

The New Freedom abroad met its severest challenge in Mexico. In February 1913 Victoriano Huerta, head of the Mexican Army, deposed and arranged the murder of President Francisco Madero, and took power as acting president. Recoiling at the treachery, Wilson refused to accord formal recognition to Huerta. Then, during the summer of 1913, he sent a special agent to Mexico City with a plan for Huerta's retirement and the election of a new government. When Huerta refused and established a military dictatorship, Wilson supported Huerta's rivals, the Constitutionalists. Finally, using the momentary arrest of American sailors at Tampico as an excuse, Wilson, on April 21, 1914, ordered the Navy to occupy Veracruz. The operation went off on schedule, but not without bloodshed and the threat of full-scale war. Wilson accepted the mediation offered by Argentina, Brazil, and Chile, but he did all he could to hasten Huerta's downfall. The Constitutionalists occupied Mexico City in August 1914, but Wilson's troubles were not over. His recognition of one Constitutionalist faction caused the leader of another, Francisco Villa, to sack Columbus, N.Mex. on March 9, 1916. Wilson sent a punitive expedition under Gen. John J. Pershing into Mexico in pursuit. Villa cleverly drew Pershing so deeply into the country that the Mexican government threatened war. A clash occurred at Carrizal, and Wilson drafted a war message. But reason prevailed, and war was miraculously averted. Wilson withdrew the expedition in January 1917.

Neutrality and the Road to War, 1914-1917.—Wilson's world was shattered by two tragedies in the summer of 1914—Mrs. Wilson's death on August 6, and the outbreak of general war in Europe a few days before. Americans disagreed about the causes and issues of the war, but virtually all of them wanted to remain outside its vortex. So also did Wilson and most of his advisers. The president not only proclaimed his government's official neutrality, but also appealed to Americans on August 18 to be "impartial in thought as well as in action." Difficulties arose first with the British, who used their sea power to control neutral trade in ways that sometimes stretched international law if they did not break it. The severest challenge came in February 1915, when the Germans announced that they would use submarines to destroy Allied merchantmen, and that neutrals might suffer as well. The British and French retaliated by declaring a total blockade against all commerce to and from Germany. The United States was caught in the cross-fire, and Wilson was prepared to make substantial adjustments. Then a submarine torpedoed the British liner *Lusitania* without warning on May 7, 1915, killing more than 100 Americans among others. Wilson warned that repetition of the sinkings would lead to war. After the torpedoing of the British liner *Arabic* on August 19, the German government gave the definite promise of safety for passenger ships that Wilson had demanded.

The *Arabic* pledge gave Wilson an opportunity to pursue a campaign for peace that he

had begun the winter before. He sent Col. Edward M. House, his most intimate adviser, to London in January 1916 to explore the possibilities of peace through Anglo-American cooperation. Soon afterward Wilson pressed the German government hard on the issue of the safety of armed merchantmen, and fought off a congressional rebellion aimed at legislation to prevent Americans from traveling on armed ships. The issue came to a head when a submarine sank the English Channel packet *Sussex* on March 24. The president threatened to break relations with Germany, and the German government, on May 4, 1916, gave a sweeping pledge to follow conventional rules in attacking merchantmen.

These events were prelude to the presidential campaign in the offing. Earlier it had seemed that preparedness would be the major issue. But Wilson had taken leadership in a moderate campaign, and during the spring of 1916 Congress was busy passing legislation to strengthen the armed forces. The Republicans nominated Charles Evans Hughes, associate justice of the Supreme Court, on an evasive platform. There was no doubt whom the Democrats would name. Wilson received the nomination on June 15, but the Democrats cheered so wildly for peace that the Democratic campaign slogan was changed from "Preparedness" to "He Kept Us Out of War." Wilson took up the peace theme at the same time that he set out to win a large number of former Progressives. He had begun this campaign earlier by obtaining passage of a bill to establish Federal Farm Loan banks to provide long-term credit to farmers. During the summer and autumn Wilson obtained adoption of other legislation that brought the progressive movement to its first culmination: a federal child labor bill; a Federal Tariff Commission; the eight-hour day for railroad workers; heavy new income taxes on the rich; and the first estate tax in American history. By making progressivism and peace the twin issues of the campaign, Wilson won enough Progressives to transform a Democratic minority

into a majority, although the change of some 1,500 votes in California would have given Hughes a majority in the Electoral College.

Wilson could now turn to the project nearest his heart; mediation of the European war. After many discouragements he asked the belligerents on Dec. 18, 1916, to state the terms upon which they would be willing to stop fighting. Through Colonel House he also began secret negotiations with the British and German governments. The British were apparently ready for serious discussions, but the Germans did not trust Wilson and decided to make one last gamble in a bid for victory with their greatly augmented submarine fleet. Their answer came on Jan. 31, 1917, in the form of a proclamation of unlimited submarine warfare against all maritime commerce, neutral as well as belligerent. Wilson broke diplomatic relations with Germany on February 3, even while he continued to hope for peace. But a series of incidents drove him to armed neutrality and then, reluctantly, to a decision for war. On April 2 he asked for a declaration of war so that America could help to preserve civilization and make the world safe for democracy. Congress adopted the war resolution on April 6, 1917.

War Leader, 1917-1918.—Never before had so many urgencies beset a harried president as during the period of American participation in World War I. There were vast new problems of military and industrial mobilization. It took strong pressure from the White House to obtain the Selective Service Act in May 1917. When industrial mobilization lagged, Wilson took control of the railroads in December and established an economic dictatorship under Bernard M. Baruch of the War Industries Board. Wilson was also commander in chief of the largest armed forces in American history; this fact necessitated frequent consultations with military leaders, particularly General Pershing, commander of the American Expeditionary Force in France. There were baffling new diplomatic problems, occa-

sioned, for example, by the Bolshevik triumph in Russia and the disintegration of the Austro-Hungarian Empire.

Wilson made his greatest contribution in formulating war aims that for the first time gave some meaning to the conflict. As early as Jan. 22, 1917, he had called for a peace of reconciliation and establishment of a postwar league of nations. He reiterated this plea in his Fourteen Points Address of Jan. 8, 1918. Abandoning the hope for a peace without victory after the Germans imposed a severe peace on Russia in March 1918, Wilson continued to voice the aspirations of liberals throughout the world for a peace based on democracy and self-determination, without annexations and indemnities.

The Germans naturally turned to the American president for armistice discussions when the fortunes of war turned sharply against them in the autumn of 1918. In brilliant negotiations Wilson persuaded the Germans to accept terms that meant virtual surrender, but with the promise that the settlement would be based upon the Fourteen Points and other Wilsonian pronouncements. After some haggling the Allies also agreed, and the Armistice was signed on Nov. 11, 1918.

The Peace Conference, Treaty Fight, and Retirement, 1919-1924.—On Dec. 4, 1918, Wilson and a large body of advisers sailed from New York aboard the *George Washington* to take part in the peace conference that would soon assemble in Paris. The president's standing had been weakened only a month before by the election of a Republican Congress after Wilson had asked for a vote of confidence. Wilson had ignored the Senate and leaders of the Republican Party in choosing peace commissioners. But in Europe he was hailed as the savior of mankind and the hope of the future.

The Peace Conference opened at Paris on Jan. 18, 1919, and continued until the Versailles Treaty with Germany was signed on June 28. There were numerous commissions, but all major decisions fell to the so-called Big Four: Wilson, Prime Minister David Lloyd George of Great Britain, Premier Georges Clemenceau of France, and Prime Minister Vittorio Orlando of Italy. Wilson was easily the most commanding figure—he best informed, the man most deeply committed to principles, and the one who, as we can now see, could judge immediate plans by long-range standards. Conflict was inevitable because Wilson meant to vindicate the Fourteen Points, while others were willing to honor them only when such virtue brought immediate reward.

The outcome of this encounter between Wilsonian idealism and European so-called realism was a compromise treaty that both vindicated and violated the Fourteen Points. It tripped Germany of her colonies and saddled her with a huge liability for reparations; it reduced the German Army to impotence; worst of all, it was a *diktat* imposed on the conquered enemy, not the negotiated settlement that the armistice agreement had implied. And yet Wilson did not labor altogether in vain. He prevented dismemberment of Germany in the West; helped to establish a new Poland; won acceptance of the principle that colonies should be administered in trust and a pledge of future general disarmament; and, most important, forced the creation of the League of Nations, with responsibility for executing the treaty and preventing future wars. He was certain that American leadership in the League and the passing of time would rectify the injustices of the settlement.

There were signs that even harder labors lay ahead by the time that Wilson presented

the treaty to the Senate on July 10, 1919. Opposition to American membership in the League, and particularly to the blanket commitment to collective security contained in Article 10 of the League constitution, had been manifest as early as March. By July 1919 isolationist Republicans, led by Senator Henry Cabot Lodge, chairman of the Foreign Relations Committee, were demanding explicit disavowal of this commitment. Unable to obtain speedy action by the Senate because of Lodge's delaying tactics, Wilson set out upon a tour of the West to generate public demand for ratification. He traveled 8,000 miles and delivered 40 addresses, the main burden of which was that future peace and American security depended upon American leadership in the new world community. The physical strain was too great for Wilson's frail body. He nearly collapsed following a speech at Pueblo, Colo., on September 25. Returning to Washington, he suffered a severe stroke and paralysis of the left side on October 2. He was thus either gravely ill or severely incapacitated at the very time that the country needed his leadership most.

The Senate voted on ratification of the Versailles Treaty on Nov. 19, 1919, and again on March 19, 1920. On both occasions Lodge, an implacable foe of both Wilson and the treaty, insisted upon reservations that would have gravely impaired American responsibility to the League. On both occasions Wilson insisted that Democrats vote for rejection rather than accept what he said was nullification of the treaty. If the Republicans would not yield, he said in a public letter on Jan. 8, 1920, then the people could decide the issue in "the great and solemn referendum," the election of 1920. On both votes in the Senate the treaty failed because neither side would budge, although considerably more than the necessary two thirds favored ratification in some form.

The dénouement came quickly and, for Wilson, tragically. The Republicans won in a landslide on Nov. 2, 1920, and the new president, Warren G. Harding of Ohio, lost no time in concluding a separate peace with Germany and making it plain that the United States would never enter the League. Late in 1920 Wilson was awarded the Nobel Peace Prize for 1919. He retired with his second wife, Edith Bolling Galt, whom he had married in 1915, to a home on S Street in Washington, where he lived in virtual seclusion as life slowly ebbed. He was interred in the Bethlehem Chapel of the Washington Cathedral.

WILSON, city, North Carolina, seat of Wilson County, 40 miles east of Raleigh, at an altitude of 140 feet. The city is on federal highways and has a municipal airport. Primarily an agricultural center, Wilson has a large bright-leaf tobacco market with 19 auction warehouses with 2 million square feet of floor space. A meat-packing plant is situated here, as are a cotton oil mill, a plant for the manufacture of animal feed formulas, and firms making textiles, concrete products, truck and bus bodies, wagons, electronic equipment, agricultural implements, and lumber and wood products. Atlantic Christian College, a four-year liberal arts, coeducational institution, was established here in 1902. The Eastern North Carolina Tuberculosis Sanatorium is also located here. There are parks and a municipal stadium accommodating 3,500 persons. The North Carolina Amateur Golf Tournament is held here annually in June.

Settled in 1847, the city was incorporated in 1849 and was named for the Hon. Louis D. Wilson, an early state senator and Mexican War volunteer. Wilson has a manager-council form of government. Population: 36,930.

NANCY GRAY

WILSON, Mount, a peak, 5,710 feet above sea level, in the San Gabriel Mountains of Los Angeles County, Calif., just northeast of Pasadena. It is well known for its scenic views and for the Mount Wilson Observatory, established in 1904, which is operated jointly by the Carnegie Foundation and the California Institute of Technology and has a 100-inch telescope.

WILSON CLOUD CHAMBER, a device invented by Charles Thomson Rees Wilson (q.v.) in 1912 for detecting the presence of electrically charged (ionized) particles such as alpha and beta particles. It consists of a chamber of moisture-laden air or other gas, in which a sudden, forced expansion and cooling of the water vapor produces a supersaturated condition. This causes a condensation of fog droplets upon any gas molecules which have been ionized by the passage of the energetic particles through them. The heavier alpha particles produce dense, straight cloud tracks and the lighter beta particles, through deflection, produce curved and more diffuse tracks.

WILSON COLLEGE, a college of liberal arts and sciences for women, located at Chambersburg, Pa. Affiliated with the Presbyterian Church, it is a privately controlled, accredited institution offering a four-year course leading to the degree of bachelor of arts. The campus, through which the Conococheague Creek flows, comprises about 70 acres in the suburbs of Chambersburg. It has dormitories, classrooms, administration buildings, a library, chapel, and other educational facilities. The curriculum permits concentration in all the standard liberal arts disciplines, leading to a comprehensive examination in one. There is a special program of Asian studies. The college, essentially residential, was founded in 1869 and named for Sarah Wilson, who gave the first endowment.

WILSON DAM, a dam on the Tennessee River in Alabama, part of the Tennessee Valley Authority system. See **MUSCLE SHOALS**.

WILT DISEASES, wĭl't dī-zēz'ēz, diseases of plants resulting from the activities of pathogens that produce a malfunction of the translocation system of the stem. Externally the plants show yellowing of the lower leaves, flagging of upper leaves, and finally wilting of leaves and young stems. The leaves may flag or wilt during the heat of the day and recover overnight for several days before permanent wilting occurs. Stems of wilted plants when cut slightly above the soil line show a brownish discoloration of the vascular system. In trees this discoloration may be found in large branches below wilted twigs. This may occur in only one portion of the vascular cylinder and frequently extends up one side of the stem.

The true wilts are caused by fungi or bacteria growing within the xylem. In herbaceous and shrubby plants the organisms commonly occur in the base of the stem and upper root portions. In trees the organisms may grow in branches well above ground, especially in those cases in which the pathogen is introduced into the tree by insects during feeding or egg laying activities. The common wilts are caused by fungi such as the genera *Fusarium*, *Verticillium*, *Ceratocystis*, and by bacteria of the genera *Erwinia* and *Corynebacterium* among others.

Three explanations for the exact cause of wilting have been vigorously supported: (1) plugging resulting from the physical presence of the pathogen, tyloses, or gums formed by the pathogen or the host reacting to the pathogen; (2) toxins produced by the pathogen that cause a loss of turgidity of parenchymatous cells, or cause tyloses and gums which impede water movements; (3) enzymes that cause the formation of tyloses and gums by their effect on the cells and cell walls (pectinases and cellulases), or that cause losses in the semi-permeable nature of cell membranes.

Losses from wilt diseases are usually progressive and may be as high as 90 percent. The agents are soil-inhabiting organisms that usually are only slightly reduced by rotations or other cultural practices. Control of the wilts rests on the use of clean seed, rotation, sanitation, and cultural practices that prevent the introduction and build-up of the pathogens. High grade resistance has been found and incorporated into many commercially acceptable varieties of plants. Soil fumigation to destroy the pathogens and control of insect vectors has been profitable in some cases.

GEORGE C. KENT,
New York State College of Agriculture, Department of Plant Pathology, Cornell University.

WILTING, wĭl'tĭng, in plants, a term applied to the familiar phenomenon of drooping, folding, or rolling of leaves and other succulent parts of many kinds of plants which occurs whenever an internal deficiency of water develops within the plant of sufficient magnitude to result in the loss of turgidity of the cells. In hot arid regions, or in bright warm weather in most temperate climates, daytime wilting of leaves may be a daily occurrence, even during a period when the soil-water content is adequate. Under such conditions it is usual for the leaves to

regain their turgidity during the night hours even if no water is added to the soil. This type of wilting, commonly referred to as temporary wilting, results from a temporary excess of the rate of evaporational water loss (transpiration) from the plant over the rate of absorption of water by the plant. During the night hours the rate of absorption of water exceeds the rate of transpiration, and the leaves gradually regain the water content and turgidity lost during the day.

When the soil-water content becomes so low that the plant can no longer absorb water at an appreciable rate, the plant passes into the state of permanent wilting. Such plants remain in a wilted condition both night and day and recovery from wilting occurs only if the soil-water content increases. In the absence of rainfall or irrigation, the water content of a plant in a state of permanent wilting steadily diminishes as a result of slow but continuous transpirational loss. Diminution in water content and loss of turgidity of cells gradually becomes systemic throughout the plant during permanent wilting. Ultimately, this leads to the death of many species of plants, although some drought-resistant species can endure the state of permanent wilting for months at a time and recover their normal physiological activities when the water again becomes available.

WILTON, wĭl'tən, town, Connecticut, in Fairfield County, situated on the Norwalk River, about 5 miles north of Norwalk. With an area of 31.3 square miles, it includes Cannondale, South Wilton, and part of Georgetown village. Chiefly residential, and the home of many artists, authors, and musicians, it has manufactures of golf clubs and of wood and metal products; it is in an agricultural area producing dairy products and fruit, also truck-farming and nursery products. Settled in 1701, it was incorporated in 1801. The town has a Congregational church dating to 1790 and is the seat of the Wilton Historical Society. It is governed by selectmen. Population: 15,989.

WILTON, town, Maine, in Franklin County, at an altitude of 690 feet, approximately 38 miles northwest of Augusta, on a federal and a state highway. Wilton is primarily a resort and farming community, and is situated in a heavily wooded area at the point where Wilson Stream flows into Wilson Lake. Wilton Academy is located here, as is the Goodspeed Memorial Library. It is the site of a shoe factory, and several other plants, making shoes, wooden and plastic novelties, and canned goods are in the area. Wilson Lake, a short distance west of the business district, is a popular vacation spot, with numerous summer camps in its environs.

Settled in 1789, and alternately known as Harrytown and Tyngstown, it was incorporated in 1803 as Wilton when Abraham Butterfield of Wilton, N.H., who had paid his incorporation expenses, renamed the settlement in honor of his original home. Wilton is governed by a town manager. Population: 4,242.

IDA MELENDY.

WILTON CARPET. See **RUGS AND CARPETS**.

WILTON MANORS, wil'tən mǎn'ərz, city, Florida, in Broward County, located on the Atlantic Ocean just north of Fort Lauderdale, from which it is separated by Middle River. A residential community, Wilton Manor contains various recreational facilities, including Mickel Field, a baseball stadium. The area was settled in the early years of the 20th century by W. J. Willingham and was named by him in honor of his wife, whose maiden name was Wilton. Originally an orange grove, the site was developed during the Florida real-estate boom in 1926. It became a village in 1947 and was incorporated in 1953. Government is by mayor and council. Pop. 11,804.

WILTSHIRE, wīlt'shīr, or **WILTS**, wīlts, county, England, covering 1,345 square miles and bounded by the counties of Gloucester, Berkshire, Hampshire, Dorset, and Somerset. It is crossed by a broad belt of chalk upland, northwest and southeast of which are fertile and mainly well-watered agricultural lands. The principal rivers are the Salisbury Avon (East Avon), flowing generally southward; the Bristol Avon (or Lower Avon), flowing northwestward; and the Kennet, flowing eastward.

Settlements are mostly confined to the lower ground, but in prehistoric times the uplands were the most densely populated part of Britain. The whole area is marked by Neolithic remains, including Stonehenge and Avebury (qq.v.). Swindon is the biggest industrial center. A large dairying area in the west is served by Devizes, Melksham, Chippenham, Calne, and Trowbridge, the county town. Wilton is famed for its carpets, and building stone is quarried at Box. The most notable buildings are the cathedral at Salisbury, or New Sarum, and the abbey at Malmesbury. There is a well-known public school for boys at Marlborough. Pop. (1961) 422,753.

H. GORDON STOKES.

WIMBLEDON, wīm'bəl-dən, municipal borough, England, residential suburb of southwest London, situated in Surrey. It is widely known for the championship tennis tournaments held annually by the All-England Tennis and Croquet Club since 1886. Wimbledon Common, covering about 1,200 acres, is a beautiful expanse with trees and bracken, ponds and lakes, a windmill, and a large earthwork popularly known as Caesar's Camp, although it is of Celtic origin. St. Mary's church retains 13th and 14th century features. Pop. (1961) 56,994.

H. GORDON STOKES.

WIMBORNE MINSTER or **WIMBORNE**, wīm'bōrn, urban district, England, in eastern Dorset, an important market center in the valley of the Stour River. Its outstanding feature is the minster, or collegiate church. A nunnery founded on the site in the 8th century acquired fame as the burial place of King Æthelred I. Danish raiders destroyed it, and the present building was begun soon after the Norman Conquest. It contains a valuable library of old books chained to the desks and an astronomical clock made in 1325. Pop. (1961) 4,156.

H. GORDON STOKES.

WIMPLE, wīm'pəl, a woman's garment, usually of linen or silk, covering the top and back of the head, the sides of the face, and the chin and

(Left) Black Star; (right) Bergdorf Goodman

Left: A wimple worn by a German nun. Its design dates back to medieval times. Right: A modern hat and scarf assembly reflecting the influence of the wimple.

neck. During the medieval period, it was often worn with a separate gorget covering the chin and neck and another piece over the forehead. The material framing the face was usually white, and the wimple was either white or a contrasting color. As more elaborate headdresses became fashionable during the early Renaissance, the wimple continued to be worn by widows, older women, and nuns; it is still a customary head-dress for nuns. The wimple has enjoyed periodic revivals in fashion.

WINANS, wī'nanz, **Ross**, American inventor and mechanic: b. Sussex County, N.J., Oct. 17, 1796; d. Baltimore, Md., April 11, 1877. In 1828, while in Baltimore for the purpose of selling horses to the Baltimore & Ohio Railroad, he became interested in the new system of transportation. The following year he was sent by the Baltimore & Ohio Railroad to study railroads in England, and on his return assisted Peter Cooper in building the "Tom Thumb." In 1831 he built the "Columbus," the first railroad car mounted on two four-wheeled trucks, and patented the first friction wheel and the first wheels and axles with outside journals for railroad cars.

In 1834, Winans formed a partnership with George Gillingham, and they began the manufacture of locomotives for the Baltimore & Ohio in 1835. Invited to Russia in 1843 to build rolling stock, he sent two of his sons in his stead and established his own locomotive shop. The powerful "camelback" was built in great numbers until Winans closed the shop in 1860. He then experimented with a cigar-shaped steamboat, which, though prophetic, was unsuccessful. During the Civil War, he was favorable to the Confederate cause and was a member of the Maryland legislature in 1861. On returning to Baltimore he was arrested for high treason but soon released.

THOMAS DE KAY WINANS: b. Vernon, N.J., Dec. 6, 1820; d. Newport, R.I., June 10, 1878. A son of Ross Winans, he was sent by his father in

1843 to negotiate with the Russian government for the equipment for a railroad to be built between St. Petersburg and Moscow. With Joseph W. Harrison, he secured the contract, fulfilling it within four years rather than the stipulated five. He returned to the United States in 1851, worked with his father on the cigar-shaped steamboat, and invented a tubular feeding device for young trout and other devices.

LAWRENCE W. SAGLE,
Director, Baltimore & Ohio Museum.

WINANT, wī'nənt, **John Gilbert**, American diplomat: b. New York, N.Y., Feb. 23, 1889; d. Concord, N.H., Nov. 3, 1947. He was educated at St. Paul's School, Concord, N.H., where he later taught, and at Princeton University, before becoming an aviator during World War I. After serving three times in the state legislature, he was governor of New Hampshire in 1925-1927 and 1931-1935. A liberal Republican, he reorganized state agencies, initiated social reforms, and welcomed the New Deal welfare programs. President Franklin Delano Roosevelt appointed him to mediate the textile strike in 1934. Designated assistant director of the International Labour Organization (ILO) in Geneva in 1935, he was shortly recalled to become the first chairman of the Social Security Board. In 1937, he returned to Geneva to the position of assistant director of the ILO, becoming director in 1939.

As ambassador to Great Britain, 1941-1946, his courage and devotion strengthened the Allied cause. Later, as United States representative on the European Advisory Commission, Winant was frustrated by insufficient directives. After the war he served as United States representative on the United Nations Economic and Social Council and as honorary chairman of the National Conference of Christians and Jews. His book, *Letter from Grosvenor Square*, was published in 1947 a few days after he committed suicide.

BERNARD BELLUSH.

WINCH, wīnch, a somewhat elaborate form of windlass (q.v.). The term originally meant the crank, projecting handle, or lever by which a revolving machine was turned, but is now gen-

Hand-operated and power-driven winches.

erally applied to a powerful machine having one or more drums on which a rope is wound for lifting or hauling a heavy object. It may be hand operated or power driven. Winches are used on derricks for raising objects into position,

on tractors for pulling heavy artillery and uprooting trees, on shipboard for hoisting anchors, or in stationary installations. The winding drum of those on derricks is equipped with a brake that is applied when the load is lowered. Hand winches mounted on skids and used independently are called crabs.

FRANK DORR.

WINCHELL, wīn'chəl, **Alexander**, American geologist and educator: b. Northeast, Dutchess County, N.Y., Dec. 31, 1824; d. Ann Arbor, Mich., Feb. 19, 1891. A graduate of Wesleyan University, Middletown, Conn., in 1847, he was professor at the University of Michigan from 1853 to 1873, working on the state geological survey in 1859-1861 and 1869-1871. He was chancellor of Syracuse University 1873-1874 and professor at Vanderbilt University 1875-1878 before returning to Michigan in 1879 as professor of geology and paleontology. He was a founder of the Geological Society of America. Best known as a popularizer of scientific subjects, especially evolution, Winchell lectured frequently and wrote many articles and books, including *Sketches of Creation* (1870), *The Doctrine of Evolution* (1874), *World Life* (1883), and *Geological Studies* (1886).

WINCHELL, **Newton Horace**, American geologist and archaeologist: b. Northeast, Dutchess County, N.Y., Dec. 17, 1839; d. Minneapolis, Minn., May 2, 1914. A brother of Alexander Winchell, he graduated from the University of Michigan in 1866 and worked on the state geological survey of Michigan in 1869-1870 and of Ohio in 1870-1872. Appointed state geologist of Minnesota in 1872 and professor at the University of Minnesota in 1874, he retained both posts until 1900. He was a founder of the Geological Society of America and *American Geologist*, a periodical which he edited with his son, Horace Vaughn Winchell (1865-1923), an economic geologist and coauthor with his father of *The Iron Ores of Minnesota* (1891). With another son, Alexander Newton Winchell (1874-1958), mineralogist and petrologist, he wrote *Elements of Optical Mineralogy* (1909). His other works include *Catalogue of the Plants of the State of Michigan* (1861) and *The Aborigines of Minnesota* (1911).

WINCHELL, **Walter**, American journalist: b. New York City, April 7, 1897; d. Los Angeles, Calif., Feb. 20, 1972. He quit school at 13 and, except for service with the naval reserve in World War I, was a vaudeville performer until he joined the staff of a theater-circuit organ in 1922. In 1924 he went to the New York *Evening Graphic*, where he originated the gossip column with immediate success. He joined the New York *Daily Mirror* in 1929, and his column became syndicated, attracting an estimated one third to one half of the readers of the newspapers in which it appeared. In 1932 he started his equally successful radio broadcasts and later appeared in films and on television.

Although accused of being more often wrong than right in his reporting, Winchell acquired undisputed influence as an arbiter of celebrity in politics and crime as well as entertainment. His compressed ungrammatical coinages were widely imitated, and his exploitation of public interest in the private affairs of the famous had

an enormous impact upon contemporary journalism.

WINCHENDON, win'chən-dən, town, Massachusetts, in Worcester County, on Millers River, 36 miles northwest of Worcester and 5 miles south of the New Hampshire border. Dairying and poultry raising are among the area's principal agricultural activities. A wood-working industry, taking advantage of the natural timber resources, began in the late 1820's and eventually specialized in the manufacture of toys. Over the course of the years, Winchendon became known popularly as Toy Town.

Settled in 1753, it was known as Ipswich Canada until it was renamed in honor of Winchendon, England, in 1764, when it was incorporated. The town comprises Winchendon, Winchendon Springs, and Waterville. The municipal government is conducted by town meeting. Pop. 8,805.

WINCHESTER, win'chēs-tər, **Oliver Fisher**, American industrialist: b. Boston, Mass., Nov. 30, 1810; d. New Haven, Conn., Dec. 11, 1880. He was a carpenter's apprentice, a clerk, and a construction worker before establishing a men's clothing store in Baltimore, Md., and later an extremely successful shirt-manufacturing company, one of the first in the United States, at New Haven, Conn. He became principal stockholder in the Volcanic Repeating Arms Company and reorganized it in 1857 as the New Haven Arms Company, producing the Henry rifle. After acquiring other patents, he again reorganized the company in 1866 as the Winchester Repeating Arms Company, which produced the famous Winchester rifle. (See *SMALL ARMS—The 19th Century*.) Winchester was elected to serve as lieutenant governor of Connecticut in 1866. He was widely known for his many philanthropies and in particular for his benefactions to Yale University.

WINCHESTER, town, Connecticut, in Litchfield County, 9 miles north of Torrington and 27 miles northwest of Hartford. The topography of the area (36 square miles) is rugged, with numerous hills and valleys. The major drainage system is provided by the Still and Mad rivers.

The town is primarily residential with the exception of its main population center, the city of Winsted. Principal industries are the manufacture of electrical goods, appliances, wire, clocks, machine tools, hosiery, pins, silk thread, and fish line. Winchester's industrial history began early, fostered by the abundance of water power at Winsted, the confluence of the Still and Mad rivers. Recreational facilities include the Taylor Brook Camp Ground, a 172-acre state park adjacent to Highland Lake.

Deriving its name from Winchester, England, the town was first settled in 1750 and incorporated in 1771. Government is of the selectmen-town meeting form. Pop. 11,524.

ROBERT C. SALE.

WINCHESTER, municipal borough, England, county town of Hampshire, located on the west side of the Itchen River, 11 miles north of Southampton. For all its modern bustle as an important administrative and commercial center, Winchester is an ancient borough and was long the capital of the kingdom. A Celtic settlement,

Caer Gwent, existed on St. Catherine's Hill on the east side of the Itchen before the Romans built a walled town (Venta Belgarum) on the present site in the 2d century A.D. Under the Saxons, Winchester (called Wintecæster) became the capital of Wessex in the 6th century, and in the 7th century, when Christianity was introduced, a cathedral was built and an episcopal see established. Winchester was chosen as the seat of government under Alfred the Great (r. 871–900/901) and the Danish kings (r. 1016–1042).

After the Norman Conquest, Winchester prospered because William the Conqueror (r. 1066–1087) made it co-capital with London and a thriving woolen trade developed, lasting through the medieval period. The Normans rebuilt the town walls and erected a castle, of which little remains except the Great Hall (altered by Henry III in 1235), where English parliaments met for nearly 400 years. In it is a painted table, 17 feet in diameter, from the 13th century or earlier, which legend once identified as the Round Table of King Arthur, as Winchester was identified with legendary Camelot. Winchester Cathedral (q.v.) was begun in 1079 and largely rebuilt by William of Wykeham (1324–1404), who also founded Winchester College (q.v.). The Hospital of St. Cross is a picturesque almshouse, founded in 1136; the endowment also provided for a slice of bread and a horn of ale for wayfarers, a practice still maintained. The 13th century West Gate of the city houses a small museum. There are remains of the 12th century Wolvesey Castle, the original bishops' residence, near Wolvesey Palace, now destroyed except for the wing that was designed by Sir Christopher Wren (1632–1723) which is the present bishop's residence. Pop. (1961) 28,643.

H. GORDON STOKES,
Author of "English Place-Names."

WINCHESTER, city, Indiana, seat of Randolph County, on West Fork of White River. It is 23 miles east of Muncie, where Lake Central Airlines operate from Johnson Field. Winchester is an important livestock and grain shipping center in a rich agricultural district. Glass and the molds used in the glass industry are its most important manufactured products.

The first town in Randolph County, Winchester was settled in 1814 and became county seat in 1818. Nearby are the Fudge Mounds, covering 31 acres, which have yielded Indian relics of historical interest. Government is by mayor and council. Pop. 5,095.

ELIZABETH ABEL MASON.

WINCHESTER, city, Kentucky, seat of Clark County, 18 miles southeast of Lexington and 9 miles north of the Kentucky River, on federal and state highways. It is primarily a residential community, situated in a prosperous agricultural region of the "bluegrass" country, noted for its cattle, sheep, horse, and turkey farms. It is equally noted as a Burley tobacco center. Clothing, lumber, brick, beverages, tubing, bed-springs, flashbulbs, and projection lamps are manufactured in the city. Southeastern Christian College, a junior college, is located in Winchester, which is also the headquarters of Cumberland National Forest. There is a daily newspaper, a radio station, and a public library.

America's oldest trail, the Warrior's Path,

passes through Winchester, which was incorporated in 1793 and named by its founder, John Baker, after Winchester, Va. Henry Clay made his first and last speeches in the Clark County Court House. Government is by city commission. Population: 15,799.

WINCHESTER, town, Massachusetts, in Middlesex County, on the Aberjona River, about 11 miles northwest of Boston, on a state highway. It is primarily a residential suburb of Boston. Leather and glue were manufactured here for many years from the latter part of the 19th century; watch hands, gelatin, and food products are now manufactured.

The first permanent settlement was established in 1640, and the town was incorporated in 1850. Originally a part of Charlestown, it later became a part of Woburn and was called South Woburn. Its present name was given in honor of Col. William P. Winchester, a merchant and local benefactor. Among the well-known residents of Winchester were Samuel McCall and John A. Volpe, governors of Massachusetts; Edward Everett, the 19th century orator; and Edwin Ginn, publisher and founder of the World Peace Foundation. The public library houses a collection of Civil War books. Government is by limited town meeting. Population: 20,267.

WHITNEY SMITH, JR.

WINCHESTER, city, Virginia, seat of Frederick County but an independent city, located in the Shenandoah Valley, 72 miles west of Washington, D.C. The municipal airport is two miles south of the city. Known as the Apple Capital, Winchester is famous for its apple products and its annual Apple Blossom Festival. Its manufactures include rubber and plastic products, furniture, knit goods, spray chemicals, conveyor belts, brake components, frozen foods, barrels, brick, tile, and lumber. Shenandoah College and Conservatory of Music is located in the city. The public school system and Handley Library are endowed.

The oldest city in Virginia west of the Blue Ridge, Winchester was settled in 1732, incorporated in 1874, and named after Winchester, England. While on a surveying expedition for Lord Fairfax, George Washington maintained an office there. It is rich in historical interest (see **WINCHESTER, MILITARY OPERATIONS AT**) and attracts thousands of tourists each year. Willa Cather and Richard E. Byrd were born in Winchester. Government is by city manager, mayor, and council. Population: 21,947.

MRS. RUSSELL O. LAFOLLETTE.

WINCHESTER, Military Operations at. Winchester, Va., was strategically important to both sides during the American Civil War. To the Confederacy, it afforded a good base for defending the entrance to the Shenandoah Valley, a rich source of supplies throughout the war, and it was a key point on an invasion route to northern territory. From the Union viewpoint, it was a good base for drives up the valley; further, in Union hands it afforded protection to the important Baltimore & Ohio Railroad.

1861-1862.—Winchester changed hands many times during the war. In June 1861, it was used as a base for Confederate Gen. Joseph E. Johnston's troops, guarding against invasion, before they moved eastward for the First Battle of Bull

Run (July 18-21). It was garrisoned by Confederate troops, commanded by Gen. Thomas J. (Stonewall) Jackson, until March 11, 1862, when he pulled back from advancing Union forces led by Gen. Nathaniel P. Banks. Ten days later, Banks decided to move most of his troops toward Washington. Instructed to prevent the move, Jackson attacked on March 23 at Kernstown, three miles south of Winchester. (See **KERNSTOWN, BATTLE OF**.) The Confederates suffered defeat, but all of Banks' troops were recalled to the valley.

With Banks following, Jackson again retreated southward. Suddenly, on May 21, he moved north, outflanked Banks by going eastward and then north through the Luray Valley, overran a small Union detachment at Front Royal, and almost cut off Banks at Middletown. The Union general, retreating northward, elected to stand and fight at Winchester on May 25. Outnumbering them 2 to 1, Jackson's forces pinned down the bulk of the enemy with a frontal attack while enveloping their right. Banks had no choice but to withdraw and flee across the Potomac River. A week later, Jackson moved south to avoid encirclement by Banks, now reinforced. Union forces then held Winchester until the beginning of the Antietam Campaign, when it was abandoned to Gen. Robert E. Lee's troops on Sept. 2, 1862. When Lee moved back from Pennsylvania, he left a small garrison in the town, which was expelled on December 27 by Gen. Robert H. Milroy's troops.

1863.—Milroy occupied the area in force until Lee again moved north en route to Gettysburg in June 1863. With 8,000 men, Milroy defended Winchester on June 12-15 against Gen. Richard S. Ewell's corps. In a costly battle—Milroy had been ordered to retreat to Harper's Ferry earlier—the Union force lost all its artillery and one third of its strength as Ewell encircled and almost bagged the entire lot. Lee retreated through Winchester in mid-July, after which the Union kept a small detachment there.

1864-1865.—In July 1864, Gen. Jubal A. Early led a strong force down the Shenandoah Valley, seized the town, threatened Washington, and raided Pennsylvania. Gen. Ulysses S. Grant, tired of the valley diversions, sent Gen. Philip H. Sheridan there to settle the issue with finality. He inflicted three defeats on Early in September-October 1864 and drove him from the valley, never to return. The first of these battles took place at Winchester on September 19. Early, outnumbered 2 to 1, at first appeared to be winning, but Sheridan overlapped his flanks and soon forced a withdrawal which almost became a rout. Winchester remained in Union hands until the end of the war.

See also **SHENANDOAH VALLEY—The Civil War**.

THOMAS E. GRIESS,
Lieutenant Colonel, United States Army; formerly Associate Professor, History of Military Art, United States Military Academy.

WINCHESTER CATHEDRAL, Winchester, England, the longest Gothic cathedral in Europe. It has a length of about 560 feet. Founded in 1079 by Bishop Walkelin, it retains its original Norman form in its north and south transepts. Important alterations were made in the late 12th century by Bishop Godfrey de Lucy, who enlarged the famous shrine of St. Swithin. The west front

was rebuilt in the middle of the 14th century by Bishop William Edington. The first major reconstruction, however, was the work of William of Wykeham, who, at the close of the 14th century, built the new Perpendicular nave, celebrated for its noble columns, its soaring arches, and its intricately sculptured vaulting. At the beginning of the 16th century, Bishop Richard Foxe restored the presbytery, embellishing it with unusual decorations, notably the carved and painted bosses on its roof. Damaged during the Reformation, the cathedral was restored during the reign of Charles I, when its tower was converted to a belfry and the stone screen, designed by Inigo Jones, was built between the nave and the choir. William of Wykeham, Izaak Walton, and Jane Austen are buried in the cathedral.

WINCHESTER COLLEGE or **ST. MARY'S COLLEGE**, a boys' preparatory school at Winchester, England, the oldest of the English great public schools. Founded in 1382 by William of Wykeham, it was opened in 1393. The architecture of the original buildings, which are still in use, is exceptionally fine. From its establishment, the school has had scholarships to New College, Oxford, also founded by William of Wykeham. The school has educated a great many prominent men, including Sir Thomas Browne, Thomas Otway, William Collins, and Sir Stafford Cripps. Seventy scholars are chosen by competitive examination and are educated at reduced fees or free. A wide range of subjects is taught, and academic standards are high. In their last years, the boys study in one of three curricula—classics, modern subjects, or mathematics and science. Enrollment averages about 520 pupils.

WINCKELMANN, vīng'kəl-män, **Johann Joachim** (1717–1768), German archaeologist and art historian. The son of a cobbler, he was born in Stendal, Prussia, on Dec. 9, 1717. He studied theology at Halle and medicine at Jena and was a tutor of languages for several families at Seehausen. Having displayed extraordinary talent in the study of Greek and Latin, he was appointed (1748) secretary of the library of Count Heinrich von Bünauf at Nöthnitz, near Dresden, where he expanded his considerable knowledge of classical civilization and became acquainted with the artist Adam Friedrich Oeser. After joining the Roman Catholic Church in 1754, Winckelmann was named librarian to Domenico Cardinal Passionei and went to Rome the next year. In Rome he met the painter Anton Raphael Mengs and Alessandro Cardinal Albani, a collector of antiquities, who became his patron in 1758. From 1763 he was prefect of antiquities and scribe of the Vatican.

Although he never realized his ambition to travel to Greece and Sicily, Winckelmann was able to devote his attention to the archaeological excavations then in progress in Italy. In 1758 and 1762 he visited Naples to observe the excavations being conducted in that vicinity. As a result of these visits, he published *Sendschreiben von den Herculanischen Entdeckungen* (1762; *Letter About the Herculean Discoveries*) and *Nachrichten von den neuesten Herculanischen Entdeckungen* (1764; *Report About the Latest Herculean Discoveries*), which acquainted the world of scholarship with the excavations at Pompeii and Herculaneum. Winckelmann's major work was his *Geschichte der Kunst des*

ALLAN CASH, LONDON

Winchester Cathedral, in England, the longest Gothic cathedral in Europe, was begun in the 11th century.

Alterthums (1764; Eng. tr. *The History of Ancient Art*, 1849–73), which influenced, among others, Gotthold Ephraim Lessing, who based much of his *Laokoön* on it. Returning to Italy after a visit in Germany, Winckelmann was murdered in Trieste on June 8, 1768, while being robbed of some medals that had been given to him by the Empress Maria Theresa.

Winckelmann was the founder of modern scientific archaeology. He developed the first techniques for determining the relative antiquity of sculptures unearthed in excavations. His approach was philosophic: he attempted to account for the superiority of Greek art by the political institutions that gave rise to it. More than any of his predecessors, he devoted his attention to the works of art themselves rather than to the lives of the artists. While he tended to concentrate on types of art, somewhat to the detriment of individuality, he established some of the epochs in the history of ancient art that are recognized, with modifications, today. His works, written in a clear and precise style, were instrumental in the rise of the neoclassical movement in art during the late 18th century. Editions of his collected works appeared in 1808–1834, in 1847, and in 1934.

	Great danger

WIND CAVE NATIONAL PARK is in the Black Hills of southwest South Dakota about 10 miles (16 km) north of Hot Springs. The park is named for the wind that blows in or out of the mouth of Wind Cave, which is the main attraction. Established in 1903, the park has an area of about 28,000 acres (11,200 hectares), mainly rolling, light-colored prairies and wooded hills used as a game preserve.

Wind Cave, perhaps once the sacred Cave of the Winds of the Sioux Indians, was officially discovered by cowboy Tom Bingham in 1881. It was formed by the action of groundwater dissolving limestone. About 7 miles (11 km) of the cave are known, including chambers 30 to 100 feet (9-30 meters) high. The cave is famous for its intricate boxwork—delicate veins of calcite deposited in fractures of limestone—and for its frostwork—tiny white crystals that hang from the ceilings and on the walls. A trip in the cave

covers about 1.25 miles (2 km) and takes about 1.5 hours. The route is lighted electrically, and a tour guide is in charge of each trip. Tours are not available during the winter.

Other attractions within the park include prairie-dog towns and large herds of bison. Other animals include deer, elk, pronghorns, badgers, coyotes, and raccoons.

Activities include camping, guided tours, hiking, nature walks, picnicking, and scenic drives. The park is operated by the National Park Service.

WIND CHILL FACTOR, a measure of the cooling effect of wind. In cold weather a person loses more heat when the wind is blowing than when it is calm. For example, when the temperature is 10° F (-12° C), a 20-mph (32-kmph) wind will make a person's body lose as much heat as it would in calm air at -25° F (-32° C). This apparent temperature drop is commonly referred to as the wind chill factor. The wind chill factor is greater for high winds than it is for moderate winds, and is greater at low temperatures than it is at moderate temperatures.

The accompanying table shows wind chill factors for winds from 5 to 40 mph (8-64 kmph) at temperatures from 50° F (10° C) to -20° F (-29° C). Winds higher than 40 mph do not greatly increase wind chill factors.

WIND EROSION. See *EROSION—Wind*.

WIND IN THE WILLOWS, an animal fantasy by the English writer Kenneth Grahame, published in 1908. Both a children's classic and an allegory for adults, *The Wind in the Willows* began as bedtime stories told to Grahame's six-year-old son.

The whimsical story tells of the adventures of four friends—the shy, unsophisticated Mole; the friendly, adventurous Water Rat; the wealthy, careless playboy Toad; and the reserved, philosophical Badger. The animals, denizens of the English countryside where Grahame lived, serve as counterparts of the human world to allegorize Grahame's reflections on life.

Mole wanders out into the sunshine, where he meets Water Rat, who offers to guide Mole on an excursion, warning him against the Wild Wood, the Wide World, and Society. After a series of mishaps befall Toad in these dangerous places, Mole, Water Rat, and Toad, under the tutelage of Badger, settle contentedly in their own environment.

WIND INSTRUMENTS comprise one of the three major families of musical instruments, the others being the strings and the percussions. Wind instruments are sounded through the emission of air, either the human breath or a bellows or other mechanical device.

In the first instance, the wind instruments in the modern orchestra are divided into the woodwinds (winds) and the brasses. The woodwinds are the flute, piccolo, oboe, English horn, clarinet, and bassoon. The brasses are the French horn (or, simply, horn), trumpet, trombone, and tuba.

The major wind instrument having air supplied by mechanical means is the organ (pipe organ). Other examples are the bagpipe and the accordion. Certain electronic musical instruments such as the electric organ, approach the sound of wind instruments, although they are not operated by air. See also articles on individual instruments.

WIND RIVER RANGE, a section of the Rocky Mountains in west central Wyoming. It extends about 120 miles (190 km) in a northwesterly direction along the border between Sublette and Fremont counties, and forms part of the Continental Divide. There are ten peaks over 13,000 feet (3,960 meters) in elevation, including Fremont Peak (13,730 feet, or 4,185 meters) and Gannett Peak (13,785 feet, or 4,202 meters), the highest point in Wyoming. Wind River flows east of the mountains, and Green River west of them.

The area has a rich history. Washington Irving described the activities of fur trappers of the early 1800's in *The Adventures of Captain Bonneville*, U. S. A. (1837), and John Charles Frémont wrote about his explorations in 1842 with Christopher (Kit) Carson. The Oregon Trail went through South Pass (7,550 feet, or 2,300 meters) in the range, where gold was discovered in 1842.

WIND, SAND AND STARS is a book by the French author and aviator Antoine de Saint-Exupéry, first published in 1939. Titled *Terre des hommes* in French, it was translated into English by Lewis Galantière. A series of reminiscences of the author's experiences in the early days of transport airlines, the book begins with his first mail flight from Toulouse, France, to Dakar, Senegal, relates adventures in South America, and returns to Africa with a grueling description of a crash in the desert and the waterless journey toward an almost impossible rescue. Another chapter gives glimpses of Saint-Exupéry's months as a reporter during the Spanish Civil War.

The book is noteworthy for its vignettes of people from many places—vignettes which give breadth and depth to Saint-Exupéry's pictures of strange lands and ways of life: Guillaumet and Mermoz, pioneering the Andes in fragile airplanes; two little girls in Argentina whose pet snakes live under the dinner table; Bark, the slave rescued from bondage, who discovers a new isolation; Bonnafous, the French leader of desert raiders; a Spanish sergeant receiving the news that a fatal mission during the Civil War has been called off.

In a lyric prose which Galantière unfortunately fails to capture, Saint-Exupéry expounds a large thesis. Each adventure, each character in miniature, is linked to the whole narrative not by plot but by theme. The book is a fearless and moving affirmation of the dignity of man, of the worth of the individual, of the mystery of human life. The essence of Saint-Exupéry's philosophy appears in such an episode as his chance landing on a desert plateau, inaccessible except by air. He knows that he is the first human being to walk this sand, and he finds there only a few pieces of meteorite—a rain from the stars. The miracle is that between the sand and the stars a human consciousness understands and reflects.

Wind, sand, and stars are the elements of the desert, but they are elements which give the mind room to grow and the spirit room to be free. In spiritual and intellectual freedom are the positive values of life; death can be relegated to comparative insignificance. Life as an adventure and a challenge, a world to be molded by creative experience—these are for Saint-Exupéry the final good.

WIND TUNNEL, a tunnellike passage through which a homogeneous jet of air is blown to determine its effects upon scale models of objects that will be exposed to such forces. The predominant application of the wind tunnel is in the field of aeronautical research and development. The validity of the experiments depends upon the principle that air moving past a stationary model at a known velocity yields the same forces as those that would act upon the model if it were moving at the same velocity through still air.

Theoretical and empirical methods for the prediction of flight characteristics are utilized in the preliminary-design stages of aircraft, but it is difficult to estimate the stability, control, and drag characteristics to the degree of accuracy required for final design. When the preliminary design is completed, a scale model of the configuration is constructed, and a test program is run in a wind tunnel to verify the designer's estimates. A study of the experimental data usually results in revisions of the configuration, followed by confirming wind-tunnel tests, until the desired aerodynamic characteristics are realized.

At this stage, extensive wind-tunnel test programs on the final configuration are initiated to establish the complete flight characteristics, control-surface hinge moments, and other related aerodynamic information throughout the speed range of the aircraft. The information is usually obtained by supporting a scale model in the air-stream and measuring the resultant forces and moments with a balance mechanism. Pressures on the various components of the model are frequently measured by gauges connected by tubing to small orifices on the surface of the model.

Although they were not the first to employ such a device, the Wright brothers built and used a wind tunnel before they made their first successful flight in 1903. A circular section acted as a shroud for the fan, which sucked air through the box-shaped test section. A 2-bladed, 24-inch-diameter fan, driven by a 2-horsepower gasoline engine, produced a maximum wind velocity of 27 miles (43 km) per hour. Higher-speed aircraft have, of course, necessitated the construction of wind tunnels of much greater size and complexity, some of them developing hundreds of thousands of horsepower, but the original objective of obtaining a homogeneous jet of air traveling at a controlled velocity has not changed.

Types. The basic elements of a continuous-flow, closed-circuit tunnel are shown in the accompanying figure. The motor-driven fans propel the air around the tunnel circuit in a counter-

Fans propel air at controlled speeds around the wind tunnel and through the scale-model test section.

clockwise direction. Through the large-diameter sections of the tunnel, the airspeed is quite moderate. The energy losses at the corners are minimized by turning vanes. The water-cooled radiators are required to eliminate the temperature rise from the heat of compression generated by the fan blades. As the test section is approached, the cross-sectional area is contracted to about one eighth of the upstream area. Because of this contraction, the airspeed increases to about eight times its upstream value as it flows through the test section where the model is mounted. At the end of the test section, the air slows down again in the diffuser, which is connected to the fan section, thus completing the circuit.

Subsonic Tunnels. In a subsonic tunnel the velocity in the test section is so low that the air can be considered incompressible—that is, the density of the air remains essentially constant throughout the flow field. Most of the early tunnels were of the open-circuit type; however, more modern subsonic tunnels are closed circuits. A relatively small amount of power is required in the subsonic wind tunnel, but it must be accurately controlled because the air velocity in the test section is directly proportional to the pressure ratio.

High-Speed Tunnels. Higher speeds may be attained in the subsonic wind tunnel by increasing the power provided to the fans or compressor. As the speed of the airstream increases above 400 miles (645 km) per hour, but still less than the speed of sound or Mach number 1, the air can no longer be treated as an incompressible medium because the air density no longer remains constant throughout the flow field. These are known as "high-speed wind tunnels."

The additional speed that may be obtained by increasing power is limited. The airspeed in the area of minimum contraction, or throat, will not exceed the speed of sound. When this speed is approached, the test section "chokes," and further increases in pressure will not increase the test-section velocity. Furthermore, the introduction of even a small model in the test section establishes a new throat that slows the air in the free stream ahead of the model.

Transonic Tunnels. The problem of alleviating choking near sonic velocity in high-speed wind tunnels proved a major stumbling block in the development of wind tunnels. Extensive research ultimately proved that tunnel choking could be essentially eliminated by cutting several streamwise slots in the test-section walls and encasing the unit in a tank or plenum chamber. Perforating the test-section walls with small holes (equivalent to approximately 20% porosity) accomplished the same purpose, and was even more successful in eliminating the troublesome reflected shock waves at the low supersonic Mach numbers. These shock waves, or pressure discontinuities, emanate from the nose of the model, rise almost vertically to the flow direction, reflect from a solid wall of the tunnel, and impinge on the model aft of the nose. This would create an error that has no physical counterpart in free flight, but, with a perforated wall, the pressure disturbance can pass through the wall into the low-pressure plenum that surrounds the test section.

Supersonic Tunnels. The fundamental difference between a subsonic and a supersonic wind tunnel is that any speed may be produced at the test section of a subsonic tunnel without altering

the shape of the rest of the channel. In a supersonic wind tunnel, however, the speed in the test section is determined by the geometry of the channel—that is, the ratio of the test section to the throat area. The channel between the throat and the test section must be expanded with great precision to attain homogeneous supersonic velocities in the test section. The air travels at approximately 50 miles (80 km) per hour in the stilling section and then it accelerates to sonic velocity in the throat of the nozzle. From this point, the nozzle expands once more to a size that provides the desired supersonic speed in the test section.

Hypersonic Tunnels. Supersonic wind tunnels that operate at greater than five times the speed of sound (Mach number 5) are usually referred to as hypersonic wind tunnels. In a tunnel with a given throat area, the Mach number increases with the expansion of the walls of the nozzle. Although the mass flow of air remains constant through the throat, the compression ratio of the air drive must increase as the Mach number increases. If the stagnation temperature of the air is constant, the ambient temperature in the test section decreases as the Mach number increases until the air liquefies, after which experimental results are no longer valid. The stagnation temperature of the air must therefore be high enough to prevent condensation.

To obtain true simulation, the inlet air should be heated until the ambient air temperature in the test section approaches the normal temperature of the atmosphere through which the craft will fly. At Mach number 12, the stagnation temperature in the stilling section must be about 8500° F (4700° C) for the ambient temperature in the test section to remain above 0° F (18° C). The maximum air temperatures obtainable with pebble-bed storage heaters is about 3000–4000° F (1650–2200° C). Higher temperatures can be obtained by discharging vast quantities of stored electrical energy into a volume of air, separated from the test section by a diaphragm, until the heat and pressure rise sufficiently to rupture the diaphragm and the high-temperature air rushes through the nozzle throat into the test section. Such discharges result in usable test times of a few hundredths of a second.

Another device for obtaining high-temperature flows of extremely short duration is the shock tube, a length of pipe containing air under pressure. A compartment at one end of the tube, separated by a diaphragm, is filled with a light gas, such as helium or hydrogen, at very high pressure. When the diaphragm is ruptured, the gas discharges against the air, heating and accelerating it much as it would in a high-speed piston.

WINDAUS, vin'dous, Adolf (1876–1959), German chemist, who was awarded the 1928 Nobel Prize in chemistry for his research on sterols and their connection with vitamins. He was born in Berlin, Germany, on Dec. 25, 1876. After studying at the universities of Freiburg and Berlin he taught at Freiburg and Innsbruck and at Göttingen, where he was also head of the Chemical Institute from 1915 to 1944. He died in Göttingen on June 9, 1959.

Windaus established that ergosterol could be activated by ultraviolet light into vitamin D₂,

an agent in the prevention and cure of rickets. His researches into the structure of cholesterol had fundamental consequences in the study of sex hormones, and his work on digitalis led to the development of various drugs for the heart.

WINDBREAK, a barrier of trees, shrubs, or both planted to break the force of the prevailing wind. Windbreaks are used widely to prevent wind erosion of the soil, but additional uses have also been developed. In cold climates, they may reduce by about 15% the amount of fuel required for home heating, and they protect livestock from adverse weather. They hold and store snow in winter, increasing soil moisture after the spring melting and resulting in more vigorous vegetation over the protected areas. Roads may also be kept free of snow by windbreaks. They are used to protect orchards during pollination and fruit-ripening periods, and conservationists use them as nesting sites for birds and to provide food and travel lanes for wildlife. Windbreaks planted in series, called shelter belts, are able to modify local climate.

The trees afford shelter for a distance of about 20 times their height. While barriers of ten rows or more may be used, they are usually not as effective as a single row of shrubs combined with a row of trees, which constitutes a semipermeable windbreak that slows the wind and permits part of the air to pass through slowly, rather than forcing all of it upward in eddy currents.

Eastern red cedar, Ponderosa pine, and Austrian pine are conifers that are widely used for windbreaks under all conditions. In semiarid climates and on soil of limited moisture-holding capacity, bur oak and Osage orange are used. Green ash, American elm, and honey locust grow satisfactorily only under conditions of somewhat higher soil moisture. Catalpa, black walnut, cottonwood, sycamore, and willow are satisfactory only on deep soils with high water tables. The planting sites must be plowed and cultivated to produce an adequate seedbed. Subsequent cultivation is usually necessary for five years or until the trees shade out weeds. Grazing animals, which may browse the trees and shrubs or kill them by trampling on the soil, must be fenced out.

WINDHAM, win'dəm, a town in Connecticut, in Windham County, in the eastern part of the state, 27 miles (43 km) east of Hartford. The principal drainage system of the town's area (27.9 square miles, or 72.5 sq km) is formed by the Willimantic and Natchaug rivers. The topography consists of broad valleys and moderately rolling hills.

The town includes the city of Willimantic and the village of Windham. Except for the industrial activities in these centers, it is residential and agricultural. Principal industries in the centers mentioned are the manufacture of paper-mill machinery, screw-machine products, thread, radio components, tool chests, vises, screws, bolts, and wire insulation. Following the usual colonial pattern of industrial development, gristmills and sawmills were the beginning of Windham's industries. In 1806 a factory for wool processing was established, and in 1854 the manufacture of thread was begun.

Named after Windham, England, the town was incorporated in 1892, only six years after the colonists first settled there permanently. Windham is noted for the curious Revolutionary War relic the "Bacchus of Windham," a wooden statue carved by British sailors imprisoned here in 1776. Government is of the selectmen-town meeting form. Population: 22,039.

WINDHOEK, vint'hōök, is the capital and largest city of South West Africa (Namibia), located 253 miles east of Walvis Bay at an altitude of 5,428 feet. Established in 1890 as a military station, it was named Windhuk in 1892 when the territory became German Southwest Africa. In 1915 it was occupied by the forces of the Union of South Africa and, after World War I, became the administrative center for the League of Nations mandate of South West Africa, which continues to be administered by South Africa. The townspeople are trilingual, speaking Afrikaans, German, and English. Dairying, cabinet-making, engineering, and brewing are among its industries, and its red and white wines are famous. The surrounding area is the principal farming district of South West Africa. With rail and air services, the town is also a commercial and distributing center. Natural hot springs are nearby. Windhoek's public buildings include a museum, library, and archives. Population: (1970) 61,260.

WINDIGO, win'di-gō, a northern Algonquian term, referring (1) to a race of giant cannibals in the mythology and folklore of the Indians of the northern Great Lakes area, and (2) to a generalized character disorder suffered by Indians of this area. Windigoes are regarded as personifications of an evil spiritual force associated with winter and starvation. Besides their gigantic stature and insatiable craving for human flesh, they are described as having emaciated bodies, hearts of ice, and twisted mouths from which issue thunderous roars and terrifying whistles. They are also endowed with prodigious strength and certain supernatural powers.

According to native belief, human beings can be transformed into Windigoes in three principal ways: (1) through anthropophagous acts, committed under duress of starvation, inducing a chronic addiction to human flesh; (2) through the visitation of a Windigo spirit during a dream or vision; and (3) through the machinations of a vengeful sorcerer. The common prodromal symptoms of Windigo disorder include anorexia, vomiting, insomnia, and melancholic withdrawal into oneself. It is felt that the sufferer can be cured during the initial stages; but the more advanced stages, characterized by perceptual distortions in which other persons are seen as edible animals and by outbursts of violent antisocial behavior, are considered beyond native therapy. When the violent stage is reached, the afflicted person is killed by the community, and the corpse is usually chopped to pieces and burned to melt the icy heart and forestall resurrection. Although belief in Windigoes is widespread among these Indians, the incidence of the disorder is quite low. The syndrome overlaps with many separate diagnostic categories employed by modern psychiatry.

RAYMOND D. FOGELSON
Eastern Pennsylvania Psychiatric Institute, Philadelphia, Pa.

WINDMILL, a machine that uses the energy of the wind to produce power. At least since the Middle Ages windmills have been used to produce mechanical power for such tasks as grinding grain or pumping water for irrigation. In Holland they have been used for pumping water to reclaim land from the sea. Windmills still are significant power sources in developing countries of the world but play a small role in industrialized countries. The first windmill used as a source of electric power was built in Denmark in 1890. Since then, wind-powered generators have been used to provide electric power to individual homes and farms, but little has been done to exploit the energy of the wind to give it a significant role in meeting energy needs.

Wind-Energy Resources. Winds, unlike fossil fuels, are a renewable source of energy. Studies at Oklahoma State University indicate that by building wind-energy conversion systems inland and offshore, the United States could generate an estimated 1.54×10^{12} kilowatt-hours (kwh) of electric energy annually by the year 2000. This would amount to 5% to 10% of the country's projected total electric power needs. It would take about 2.2 billion barrels of oil per year to generate the same amount of electrical energy.

Three moderately high-wind areas offering promise for the development of wind power in the United States are the Atlantic coast, the Great Plains, and the Pacific coast.

The design and operation of a windmill depend on characteristics of the wind—notably wind speed and changes in wind speed, wind direction and changes in wind direction, wind turbulence, and the height of the wind above the ground.

Regions where the average wind speed is high—15 to 25 miles (29–40 km) per hour—and where there is a prevailing wind direction are favorable for windmills. Light winds—less than 5 miles (8 km) per hour—will not start up a windmill. Strong winds, such as those of a hurricane, are too hazardous for the safe operation of a windmill.

Wind turbulence, which is unfavorable for windmills, generally is more prominent near the ground than at greater heights because of uneven terrain or other factors that tend to break up a smooth flow of air.

In general, the greater the height above the ground at which the wind is blowing, the greater the wind speed. This characteristic stems from the fact that retardation of the wind by ground friction decreases with increasing altitude.

Windmill Design. The essential feature of a windmill is a rotating member driven by the wind. Generally, the rotating member carries sails or consists of metal vanes or propeller blades, although other designs for extracting energy from the wind have been used.

All windmills can be put into two classes—the horizontal-axis windmill, which includes the post, tower, metal vane, and propeller types, and the vertical-axis windmill, which includes the Persian windmill, the Darrieus rotor, and the S-rotor. In the former class the shaft of the rotating member is horizontal or nearly horizontal, whereas in the latter class it is vertical. A horizontal-axis windmill must be provided with some means to point into the wind for maximum power generation, whereas a vertical-axis windmill operates independently of the wind direction. (In the literature the terms "horizontal

windmill" and "vertical windmill" are sometimes used. A horizontal windmill is a vertical-axis windmill, and a vertical windmill is a horizontal-axis windmill.)

Windmill Power and Efficiency. The power in a wind striking a windmill is proportional to the cube of the velocity of the wind, V^3 , the square of the diameter of the windmill's rotating member, D^2 , and the density of the air, ρ .

The power output of a windmill depends on V^3 , D^2 , ρ , and various other mechanical and aerodynamic factors. For a propeller windmill, these include blade angle, blade twist, ratio of blade area to area swept by the blades, angle between the wind and the propeller rotation plane, the ratio of the wind velocity to the rotational velocity of the blades (the tip speed ratio), and the weight of the rotating parts. A propeller windmill has an efficiency of about 40%; a Darrieus-type rotor, 40%; an S-rotor, about 30%; a multivaned windmill, 15% to 30%; and a Dutch windmill, 5% to 10%.

All of the power in a passing wind cannot be intercepted and extracted by a windmill because the wind speed downwind of the windmill would then be zero, which is impossible. About 1920 the German aerodynamic engineer Albert Betz first showed that no windmill can extract more than 59.3% of the wind energy passing through the area swept by the windmill blades. In practice, the efficiency of a windmill in converting wind power to the mechanical power of a rotating shaft is limited to about 42%. When used with a generator to supply electric power to a user, the overall efficiency in converting wind power to electric power is about 30%.

Wind Power for Home and Farm. Small-scale wind-power systems suitable for providing electricity or mechanical power for rural homes or farms are commercially available. A small-scale system generally includes a propeller and dc generator rated in the range from about 50 to 6,000 watts, a tail vane to keep the propeller rotation plane perpendicular to the wind direction, a steel tower 10 to 100 feet (3-30 meters) high, a set of 20 or more lead-acid storage batteries charged by the generator to provide electric power when there is little or no wind, and an inverter that converts dc to ac. Such a system is considered practical in areas where wind speeds average 8 miles (13 km) per hour or more.

A 6-kilowatt wind generator has an output of 325 kwh per month in an area where the average wind speed is 10 miles (16 km) per hour. It can supply enough power to meet all the electrical needs of a modern household except for cooking and heating, which can be done with gas. Such an installation requires about 75 storage batteries to provide electricity during windless times.

In the early 1970's in the United States, the complete installation cost for a 2-kilowatt system was about \$1,400 per kilowatt of capacity. The cost of wind-generated electrical energy is in the range from 10 to 25 cents per kwh, depending on wind conditions, cost of equipment, and interest rates. This range includes the cost of batteries for energy storage and an inverter. Where an ac generator is used to provide power directly, such as to water-pumping equipment for irrigation, the cost can decrease to about 5 cents per kwh. For comparison, an electric power station generator costs about \$150 per kilowatt of capacity, and the electricity to the user costs 3

GRANT HEILMAN

WIDE WORLD

ARTHUR OLLMAN, SOLAR WIND
SMITH-PUTNAM 1,500-kilowatt wind generator was built in Vermont in 1941. Its blades span 175 feet (left). Six-kilowatt wind generator atop tower in Maine provides home electricity (above).

to 8 cents per kwh. The cost of power generated by a home diesel or gasoline generating set is about 30 cents per kwh.

For use on farms, an alternative to the storage battery is under development. In this system, electricity from the wind generator is used to dissociate water, thereby producing hydrogen and oxygen gases. These gases are stored for later use in a fuel cell, internal-combustion engine, or burner.

Large-Scale Wind-Powered Systems. Large-scale wind-powered systems are attractive because they do not cause air, water, or thermal pollution; are virtually free of noise when operating; and require little maintenance and no fuel. According to William Heronemus of the University of Massachusetts, wind-powered systems have the greatest chance of being used to supply an important part of the U. S. energy needs in the near future at costs that are competitive with other systems.

To tap wind power on a large scale, Heronemus proposed the erection of 15,000 towers on the Great Plains, spaced as closely as one per square mile (2.6 sq km). Each tower would carry 20 wind turbines, making a total of 300,000. Each wind turbine would consist of a two-bladed propeller with a 50-foot (15-meter) diameter, tip to tip, and each would drive a generator connected to an electrical network. Such an array on the Great Plains could provide the equivalent of an installed capacity of 189,000 megawatts, or nearly half of the total installed capacity of electric power plants in the United States in the mid-1970's.

Heronemus also proposed that large arrays of wind generators be based at sea, where powerful winds provide a good source of power.

EARLY WINDMILLS

Persian Windmills. The origin of the windmill is obscure, but records indicate that it was in use in Persia in the 10th century, perhaps even as early as the 7th century. In a Persian windmill the sails revolved on a vertical axis. The wind was directed onto the sails through slots in a wall surrounding the windmill. The Persian

design was transmitted to China, perhaps by 1200 A. D. The Chinese discarded the enclosing wall and improved windmill operation by using sails that feathered. Such a windmill was used mainly to lift water for irrigation.

European Windmills. In Europe the earliest windmills appeared almost simultaneously in France and England toward the end of the 12th century. These windmills, which typically had arms mounted on a horizontal or nearly horizontal axis, almost certainly were invented independently of Persian or Chinese designs. They were used mainly for grinding grain or pumping water.

Post Mill. The earliest windmill in France and England was the post mill. It had a box-shaped wooden body that carried sails on a nearly horizontal shaft. The body and roof of the windmill were supported by a horizontal beam that rested across a well-supported central vertical wooden post. The horizontal beam was pivoted on the vertical post and thus was free to rotate in a horizontal plane. The whole structure of the windmill was turned by means of a tail pole attached at the back side of the windmill. The miller set his shoulders to the tail pole and slowly walked the whole windmill around until the sails faced into the wind.

Use of the post mill spread through Germany, Holland, and other parts of northern Europe by the end of the 12th century, and it became established in southern Europe a few centuries later. The post mill remained in use for hundreds of years. The earliest examples still standing date from the early 17th century.

Tower Mill. The tower mill was invented in Europe early in the 15th century. It had a stone or brick tower and a timber roof, or cap, that contained the shaft on which the sails revolved. The sails were faced into the wind by rotating the entire cap on a circular wooden track or, later, on wooden or metal rollers. This was done by the miller, who moved a tail pole connected to the cap. Some of the finest tower mills were built in Holland, where many still stand. They survived in greater numbers than the post mills because their bodies were made of brick or stone rather than of wood.

A typical Dutch gristmill stood about five stories high and had a windwheel consisting of four sail frames, each about 30 to 40 feet (9-12 meters) long. Canvas sails, stretched over the wooden frame, were set at an angle to the plane of the windwheel of about 18° at the inner end, gradually decreasing to about 7° at the outer end. The cap, comprising the upper 12 feet (3.7 meters) of the mill, revolved on a turntable, which enabled the miller to change the position of the windwheel by operating a windlass controlled from a platform at the second-story level. A friction brake band, controlled from the same platform, stopped and started the machinery. A fly governor on the fourth story automatically regulated the speed and braked the machinery if the wind became too strong for safe operation. Levers adjusted the pressure between the two grinding stones and acted as an additional brake.

The nearly horizontal shaft of the windmill was connected by gearing to a vertical shaft, at whose bottom was more gearing for driving the upper grindstone. The grain was crushed on the first floor before being lifted by buckets to bins on the third floor, where it was cleaned by fans. It was then carried through chutes to the grinding stones on the second floor. The ground meal passed through chutes to the first floor where it was sifted through various grades of silk and stored, according to its texture, in bins. The capacity of such a mill was 20 to 40 barrels of meal per day.

The post mill developed 2 to 8 horsepower, and the tower mill 6 to 14 horsepower. Despite their relatively inefficient use of power, windmills were used in large numbers until the development of the steam engine, the internal-combustion engine, and the electric motor. In Holland about 9,000 windmills were in use in the mid-19th century. Of these only about 950 remain, including about 100 that are still workable.

MODERN WINDMILLS

Multivaned Windmill. The multivaned windmill, developed in the United States in the last half of the 19th century, consists of a number of small metal vanes set radially in a wheel. It was widely adopted by the end of the century, and thereafter its use spread through the world.

As standardized, it has a windwheel 8 feet (2.4 meters) in diameter with many steel blades set radially close together. Mounted on a steel tower about 35 feet (10.7 meters) high, this windmill is usually geared to a pump that can be detached and operated by hand. The mill can pump water from great depths for livestock, irrigation, or household use.

During the early 20th century, a steel-tower multivaned windmill rose above nearly every farm in the Midwest and West, but the rapid advance of rural electrification during the 1930's eliminated most of them. However, they still remain in use in India and other developing countries.

Propeller Windmill. The propeller windmill, generally having two or three blades, came into use following the development of the airfoil propeller for aircraft in the 1920's. The propeller windmill typically is used in conjunction with a generator to provide electricity in isolated rural areas. Small propeller windmills provide electric power to a home or farm. Large propeller windmills are experimental or under development. They provide electric power to a distribution network, as does an electric power station.

Beauchamp E. Smith, Palmer C. Putnam, and co-workers pioneered the development of the large propeller windmill. They built and operated a 1,250-kilowatt wind turbine and generator unit that delivered electricity to the network of the Central Vermont Public Service Corporation during 1941-1945. The wind turbine had two stainless-steel blades and diameter of 175 feet (53.3 meters) from tip to tip. The turbine and generator were mounted on top of a 110-foot (33.5-meter) tower, which was located at the summit of Grandpa's Knob, a 2,000-foot (610-meter) hill near Rutland, Vt. This wind turbine lost a blade and was shut down in 1945.

In the mid-1970's several organizations, including the Aerowatt Corporation in France and the National Aeronautics and Space Administration (NASA), were pursuing the development of large wind-generator systems. NASA plans to build and test an experimental 100-kilowatt windmill with two blades that span 125 feet (38 meters) from tip to tip. Even larger systems of this type are envisaged for the most extensive exploitation of wind-power resources.

Vertical-Axis Wind Turbines. The Finnish engineer S. J. Savonius patented a vertical-axis wind turbine in 1929. This machine, called an S-rotor, can be visualized as being formed by slicing a vertical hollow cylinder in half from top to bottom and then moving one half sideways until its trailing edge points at the middle of the other cylinder half. With this design, one half of the S-rotor is convex to the wind and the other half is concave. The side that is convex to the wind is rotated by wind spilling from the side that is concave to the wind. One leader in the development of the S-rotor in the 1970's was the Elektro G.m.b.H. firm of Switzerland.

The French engineer G. J. M. E. Darrieus patented a vertical-axis wind turbine in 1931. It

VERTICAL-AXIS WIND TURBINE of the Darrieus type is tested in a wind tunnel in Canada.

NATIONAL RESEARCH COUNCIL OF CANADA

consisted of two slender semicircular blades, both attached to the top and bottom of a vertical shaft. The Darrieus rotor was independently reinvented by the National Research Council (NRC) of Ottawa, Canada, in the early 1970's.

WINDOW, wīn'dō, an opening in the wall of a building designed to admit light and air. The admission of light is accomplished through the use of transparent or translucent panes; ventilation, by opening the sash to the outside air. The frame in which a window is set is a *casing*. It has a *sill* at the bottom, *jamb*s at the sides, and a *lintel* as a straight, horizontal member at the top, or the head may be arched or pointed. The *sash* is the movable part of the window and is called a *casement* if it opens on hinges at the side. It is glazed with *panes*, or lights, usually of transparent glass, but the panes in church and cathedral windows are commonly of stained glass, and in buildings where a diffused light is preferred, or where visibility from the outside is undesirable, they may be frosted or tinted. The pane may completely fill the sash in which it is set, but several smaller ones are frequently used instead of a single sheet. They are separated by slender wooden, metal, or lead bars, the vertical divisions being called *mullions*, the horizontal ones *transoms*. These bars are sometimes less correctly referred to as muntins or muntings, a corruption of *montant* mullion. When the bars radiate from the center, the window is known as a *wheel*, or as a *rose window* if of stained glass, as in a church.

Rise of Metal in Window Construction.—The development of new construction methods and materials has greatly increased the importance of windows in architecture. Where before 1945 modern window sashes and casings were made almost exclusively of wood, a growing proportion have since been constructed of aluminum, steel, and stainless steel. Use of comparatively narrow strips of these metals, in place of wider wooden members, has permitted an increase in the size of glass panes, thus increasing the size of the opening to light and air. Metal window sashes and casings were first tried in schools, hospitals, and other public buildings, but low maintenance costs, especially of aluminum, which requires no repainting because of resistance to rot and rust, soon made them popular for commercial and industrial structures and also for residential construction. The entire walls of some office and factory buildings are now made of glass, much of it double glazing to create a dead-air space between the twin panes and prevent loss of heat during cold weather.

Types of Windows.—Windows in common use are of several types, depending upon the style of architecture and the taste or preference of the builder. Perhaps still the most popular is the *double-hung window*. It has two sashes that slide up and down with the aid of weights on cords or chains running over pulleys at the top and concealed in pockets inside the casing. More modern hardware includes spring clips that hold the sash in place by compression against the jamb. *Casement windows* are hinged vertically

at the sides and usually open outward, manually or by means of a crank or handle operating a simple chain of gears, although they may be hinged to open inward instead. *French windows* reach to the floor, for which reason they are also called French doors. They usually open inward. *Awning windows* consist of three or more horizontal sashes hinged at the top so that they open outward, acting as awnings to keep out rain when open. They are usually controlled from the inside by means of a crank, some being arranged so that all sections open or close simultaneously; in others a delaying action allows the bottom unit to open part way before the upper sections move.

Hopper windows are hinged at the bottom and open inward. *Bay windows* are three or more windows, frequently double hung, with the outer pair at an angle to the wall from which they project outward. If they are curved to form an arc of a circle, they are called *bow windows*. Properly speaking, bay and bow windows appear only on the ground-floor level; on upper floors they are known as *oriel*s. A *dormer window* is one placed at a right angle to a pitched roof and covered by a small pitched roof of its own. *Fixed windows* are those with a sash that does not open. Especially when large and opening on a view, they are known as *picture windows* and have become very popular in the design of modern homes. They are frequently flanked by narrow casement windows or others that will open to provide ventilation, but if the room is air conditioned, this is not important. A *window wall*, as the name implies, is an entire wall, sometimes of basic windows, sometimes of glass panels, some of which may be arranged to slide horizontally for entry to a terrace or patio; or the wall may be built of glass brick.

Sliding windows with wall space between sill and floor were originally designed for ranch-style and other modern houses where the accent is on the horizontal, but now they are considered compatible with many types of architecture. *Jalousie*, or louvered, windows consist of multiple horizontal glass slats, or louvers, fixed on pivots at the ends so they can be opened to any angle like venetian blinds. They overlap slightly when closed. Somewhat wider slats are pivoted vertically and are classed as *pivoted windows* or *solar shades*. Some are controlled by sun-powered motors. Another style still found in modern buildings is the *clerestory*, a shallow window or row of windows installed at the top of a wall under the roof line.

HISTORY

Windows played but a minor role in Egyptian houses. They were small and set high in the wall, more for ventilation than for light. However, the hypostyle halls of such large Egyptian temples as Karnak had clerestories at the top of the central aisle for lighting. Greek temples were lighted only through the door, and in houses the rooms opened on courtyards and needed no further light. The more complex imperial Roman buildings, like basilicas and baths, often had large lunettes under the vaults, perhaps subdivided by mullions. Windows, though

still small, became more numerous in the clerestories of Early Christian basilicas and later in Byzantine architecture. A ring of such windows at the base of the dome in Hagia Sophia, Istanbul, bathes its interior in soft light. In all these styles, the windows were little more than holes in the wall. Thin slabs or grills of translucent alabaster might exclude rain, but in most cases the windows were left open. With the Romanesque style of the 11th and 12th centuries in western Europe, moldings began to enframe the windows and thus add to their prominence.

The window came into its own in the Gothic style beginning in the late 12th century. Its great cathedrals were cages of glass and stone with windows replacing the wall from buttress to buttress or pier to pier. The glass was set in the center of the wall, and moldings or colonnettes adorned the diagonal splay of the arches or jambs inside and out. Since the lead bars that held the small pieces of stained glass were weak, stone mullions were needed to subdivide the window and to support the patterns of tracery within the arch. Especially in the late Gothic, elaborate patterns were popular.

In houses, the size and location of windows were determined by the rooms they lighted. Vertical mullions and horizontal transoms subdivided the larger windows. During the earlier Middle Ages, shutters closed such windows, though panels of horn or wooden lattices may have been used. By the 15th century in northern Europe, glass began to appear in houses, usually only in the upper part of the window with shutters for the lower part.

Though smaller than the Gothic, windows in the Italian Renaissance of the 15th and 16th centuries remained of substantial size. They were evenly spaced and arranged to produce a symmetrical design. The jambs were often molded, or the window framed with pilasters or engaged columns. Cornices or pediments were set above them. Such windows were features in the design of the building.

The sashes of Gothic and Renaissance windows were invariably casements. The first certain appearance of the double-hung sash occurred in England late in the 17th century, and it rapidly replaced casements thereafter. The panes were small in size because of the difficulty of procuring sheets of glass of uniform thickness. Hence many panes were needed for each window. As methods of glass production improved during the 18th and 19th centuries, the size of the panes increased, and the number per window declined. Thus a window of 1730 might have 18 or even 24 panes, while one of the same size in 1830 would have only 4. This trend ultimately led in the 20th century to the single pane picture window and even to the window wall. In this last case, the windows, although still forming part of the design of the building, have lost the individual prominence of Gothic or Renaissance windows.

WINDOW BOX: a container filled with plants, which normally rests on a windowsill but can be attached as well to the building below the window. A window box gives people the possibility of having a small garden in a confined area, when they have no other areas to plant, for very little

expert knowledge and effort. It has been traditional in Britain and Europe in general to have billowing and floriferous window boxes cascading with plants adorning apartment windows, houses, storefronts, restaurants, and even service stations.

The average window box is 36 inches (90 cm) long, 8 inches (20 cm) high, and 8 inches wide, but it can be made or bought to fit the actual size of your window ledge. The box should not exceed 4 feet (1.2 meters), as it would become unwieldy and dangerous otherwise. It can be made from different rot-resistant woods such as redwood, cedar, teakwood, clean pine (without knots), or plywood treated with a noncreosote wood preservative that will not harm the plants by leaching into the soil. Other possibilities include cast stone, lead, concrete, terra cotta, fiberglass, plastic, or metal. The last two, however, are not always the best choices as they tend to heat up.

If you do not buy a ready-made box but build one, keep in mind the importance of reinforcing the corners securely either by screwing the corner edges together with galvanized screws (nails have a tendency to pop out over a period of time) or with angle irons attached to each corner. The wood should be at least 1 inch (2.5 cm) thick for insulation purposes, and a number of drainage holes should be drilled into the bottom of the box.

Plants may be planted in good potting soil, mixed at home or bought in a store, or individual pots with plants in them may be placed in the box with sphagnum moss acting as a mulch for insulation purposes. If planted, leave at least $\frac{3}{4}$ inch (2 cm) from the top of the soil line to the top of the box so the soil does not spill over the side when watered. Pack in the plants as close as possible to give an immediate effect of fullness to the box as well as to produce an abundant bloom. All boxes should have drainage materials (crock, pebbles, etc.) at the bottom to ensure proper drainage.

Since window boxes are not just an architectural feature but are filled with living things, they should be watered on a regular basis. Because of window overhang above, rain normally will not water boxes. During the height of the season, boxes should be checked for watering daily. Water thoroughly, going from end to end over the entire soil surface, and make sure to give enough water to have it pour out the drainage holes. Plants can be fertilized every two weeks during the height of the season. Make sure boxes are attached either to the windowsill or window frame securely.

For sunny and hot exposures the top choices are geraniums, marigolds (lower French variety), petunias, lantana, verbena, wax begonias, miniature snapdragons, Madagascar vinca, phlox, and portulaca. For partial shade, lobelia, Madagascar vinca, fuchsia, coleus, and caladiums are to be recommended.

For the front of the box, to create a spilling over, cascading effect use English ivy or periwinkle, either regular or variegated spider plants, asparagus fern, ice plants, or ivy-leaved geraniums. As an added treat, attach a trellis to the back of the box and run up it climbing plants such as morning glory, black-eyed Susan vine, or scarlet runner bean.

WINDS, air motion over the ground. A wind has a direction and a speed. The familiar weather vane is one way of measuring wind direction. Wind speed is usually measured by an instrument called an anemometer. The measurement of wind speeds aloft is often made by radar tracking of weather balloons or sensors on aircraft. Measurement by radar and satellites is also becoming more common.

The crews of the early sailing vessels had keen weather eyes. Those who ignored the winds perished. The early seafarers learned to measure the winds by observing the state of the sea or the sky. The familiar refrain "red sky in the morning, sailors take warning; red sky at night, sailors' delight" is one such example.

Today, experienced sailors can make good estimates of the wind by using the Beaufort wind scale, which is based upon the state of the sea surface. (See **BEAUFORT SCALE**.) A common measure of wind speed is the knot (kt). One knot represents a speed of one nautical mile per hour. There are 60 nautical miles in one degree of latitude. Therefore, a balloon carried along by a 30-knot north wind will move southward 60 nautical miles, or one degree of latitude, in 2 hours. (One knot is equal to 1.15 standard miles, or 1.85 km, per hour.)

1. Winds and Human Activity

Winds affect human life in many ways. Wind-driven waves on the ocean may reach enormous heights of 32 to 65 feet (10–20 meters). A so-called rogue or "freak" wave triggered by an unexpected squall (strong wind with speed of 25 to 30 knots or more lasting for at least two minutes), may have been responsible for sinking the *Pride of Baltimore* in the Caribbean in April 1986. The storm surge (wind-driven water) that accompanies a hurricane crossing a coastline may destroy nearly every beachfront dwelling, particularly at high tide. In August 1969, a storm surge of 23 feet (7 meters) above normal high tide with the landfall of hurricane Camille caused about a billion dollars of damage along the gulf coast and killed many people.

Locusts and grasshoppers have plagued farmers since the dawn of human civilization. Wind-borne swarms of these insects will eat their way through all crops in their path. Accurate forecasts of wind direction and speed are crucial to controlling these plagues, especially in Africa where the swarms may cover thousands of square kilometers.

Just as the wind may carry insects long distances, so it may carry pollen or pollution particles. In 1883 the island of Krakatoa in the Pacific was destroyed by a titanic volcanic eruption. The return of plant and animal life to the remnant of the destroyed island has been helped by wind-borne pollen and insects from nearby land areas. Similarly the wind carries pollution particles thousands of kilometers from their source regions. The acid rain that falls over much of the industrialized world is one example of this process. And in a tragic example of the power of wind movement, radioactive debris from the meltdown of the Chernobyl nuclear reactor in the Soviet Union in April 1986 was carried westward and northward by the wind across parts of Europe.

Wind Speeds. Everyone has felt the power of the wind. The force that one feels on the body from the wind is approximately proportional to

the square of the wind speed. Double the wind speed and the wind feels four times as strong. A gentle 10-knot breeze is enough to keep leaves moving on trees and stir whitecaps on water. Entire tree branches sway with a 20-knot wind, and spray is kicked up on water surfaces. Winter rain and snowstorms commonly produce winds of 30 knots. At such velocities walking becomes difficult and trash barrels are littered with destroyed umbrellas. Severe winter blizzards may produce winds of 50 knots or more, strong enough to knock a person over and cover recently plowed roads with snow drifts. Many objects, including people, can become airborne with a 100-knot wind.

Topographic features may contribute to very high wind speeds as air flows downhill or funnels through a narrow canyon. Cold air moving rapidly downward from highland regions was responsible for a severe Arctic windstorm at Thule, Greenland, on March 8–9, 1972, that produced extreme gusts of 180 knots. In the United States, Boulder, Colo., is famous for its high winds in winter that sometimes reach 100 knots as air rushes down the Rocky Mountains onto the plains below. America's Mount Washington, in the state of New Hampshire, is famous for high winds. Indeed the fastest wind ever recorded on the surface of the earth occurred there on April 12, 1934, when a wind gust reached 201 knots. Over level ground the fastest wind ever measured occurred at Chetumal Airport in Mexico on Sept. 27, 1955, during Hurricane Janet. The anemometer recorded a peak gust of 150 knots before it blew away!

The measurement of high winds is very difficult. Most anemometers do not work very well once the wind speed reaches 100 knots. Even a very sturdy anemometer may be destroyed by flying debris at very high wind speeds.

Fortunately, average winds are light winds. Typically, the wind may blow almost 10 knots during the day and then drop off after sunset, especially on clear nights. As the ground temperature is lowered, a shallow dome of cool, nearly motionless air may form just above the ground. It is to take advantage of these lighter winds that hot-air-balloon festivals are scheduled near sunrise and sunset. After sunrise, surface heating destroys the shallow dome of sluggish cold air, and higher wind speeds result.

Wind speeds are greater at altitudes of 4.5 to 7.5 miles (8–12 km) above the ground. Westerly winds that are 6 miles (10 km) above the ground along the coast of Asia and over eastern North America may exceed 200 knots in winter. These high wind speeds are part of an undulating ribbon of air called the jet stream that circles the globe and controls the weather. Experienced air travelers are well aware that eastbound flights are usually shorter than westbound flights between the same two points because of the tail wind provided by the westerly jet stream. See **JET STREAM**.

2. Causes of Winds

Air moves from regions of higher pressure and toward regions of lower pressure. And the greater the difference in air pressure between the high and low regions, the faster the air will move. Air pressure is commonly measured by a barometer. A barometer measures the weight of air in an imaginary column above the instrument. The force (weight) of this air column per unit

area is the air pressure. Changes in air pressure at different locations affect air speed and wind direction.

There are several different forces that move the air and create what is known as the wind. Each of these forces has both a magnitude and a direction. The principal forces include weight, pressure gradient force, friction, the Coriolis force, and centrifugal force.

Weight is the force that always acts downward toward the center of the earth and produces a downward acceleration due to gravity of 32 feet or 9.8 meters per second per second.

The pressure gradient force is the difference in atmospheric pressure between any two locations divided by the distance between them. The vertical part of the pressure gradient force (pressure decreases upward) tends to balance the downward acceleration of gravity. This is called hydrostatic balance. The up-and-down motions of air are gentle, typically several centimeters per second. In intense thunderstorms, however, air may accelerate to up-and-down speeds of tens of meters per second. The strong updrafts and downdrafts in the storms can be very dangerous to aircraft that encounter them.

The horizontal part of the pressure gradient force drives the winds. The stronger the horizontal pressure gradient force, the greater the horizontal acceleration of air from higher toward lower pressure and the stronger the wind. Thus, the greater the pressure differences between any two locations, the greater the wind speed.

Air in motion is affected by friction. Friction results when individual air molecules rub against each other or the ground. The effect of friction is to slow down the wind just as a boat is slowed down by friction with the water. The United States regained the America's Cup from Australia in 1987 in part because the American boat was designed in an unusual way to reduce friction. The slowing action of friction is greater over the rough land than the comparatively smooth sea.

The Coriolis force can be described as the effect produced on a moving body by the earth's rotation. This force acts to deflect winds to the right of their path of motion in the Northern Hemisphere and to the left in the Southern Hemisphere. The location of latitude of the winds and how fast the winds are moving help determine the degree of deflection to the right or left. The Coriolis force varies in magnitude from zero at the equator to a maximum at the poles. The wind speed affects the Coriolis force because the stronger the wind the greater the amount of wind deflection.

Here is one way to picture the effect of the Coriolis force. Suppose a projectile were fired in a straight line path from the North Pole toward a target on the equator. The projectile would land to the right of its true path. This happens because the earth rotates from west to east. Thus the target area would have moved eastward before the projectile reached it.

Try the following experiment to picture the effect of the Coriolis force. Mount an old record on a turntable. Turn on the turntable. Line up a ruler with the center of the spinning turntable and the edge of the record. Scratch the record by drawing a straight line with a knife while the record is spinning. Shut off the record player and look at the record. The scratch will be a curved line. Viewed from above the spinning

turntable you drew a straight line, but viewed from on the spinning turntable you drew a curved line. The difference is entirely a matter of perspective.

Now we are in a position to understand why the winds blow as they do. The horizontal pressure gradient force tends to be largest in winter when the temperature contrasts between land and sea and polar and tropical regions are greatest. As soon as winds move toward lower pressure, however, they will be deflected toward the right in the Northern Hemisphere and left in the Southern Hemisphere, due to the Coriolis force. Eventually a balance is reached between the pressure gradient and Coriolis forces so that the winds tend to blow almost parallel to the isobars, the name given to the imaginary lines on a weather map that connect points of equal barometric pressure. Under these conditions the winds generated by the balance of forces are called geostrophic ("earth-turning") winds.

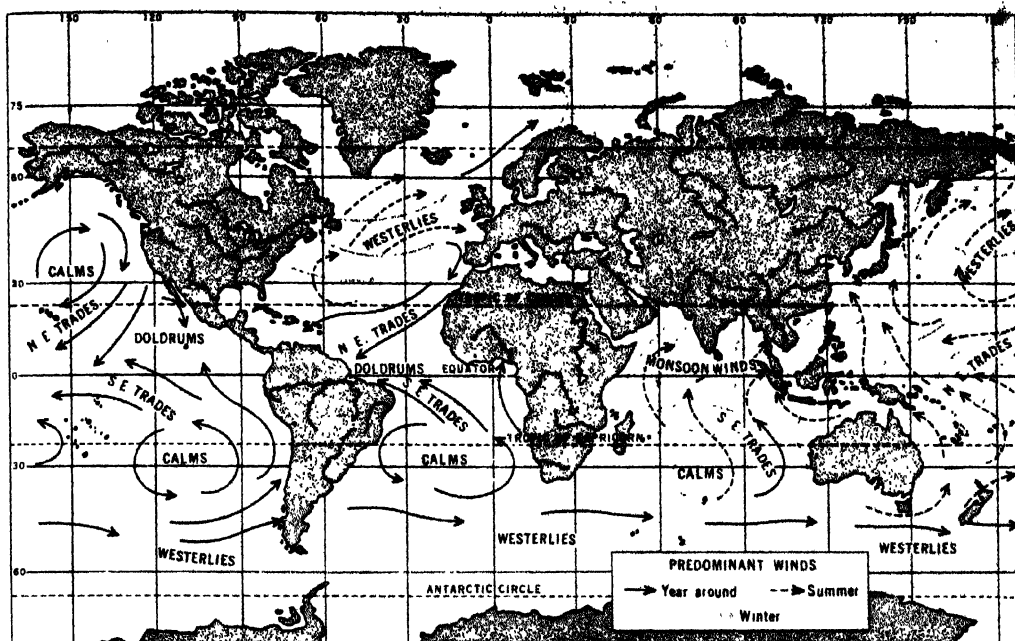

In the atmosphere the geostrophic wind is a fairly good approximation of the true wind. But close to ground level the true wind may only be 30% to 50% of the geostrophic wind because of friction due to various land formations. Over large bodies of water the true wind is 70% to 80% of the geostrophic wind as a result of reduced friction.

The geostrophic wind is a fairly good approximation of the actual wind speed and direction as long as the air flow is not highly curved and friction is not too great. But when the air flow is highly curved, as in cyclonic storms such as a tornado or hurricane, the effect of centrifugal force must be considered.

Centrifugal force can be explained by a simple example. Suppose a person whirls a ball at the end of a string. There is a tendency for the ball, traveling in a curved or circular path, to continually move away from the center of its path and fly off into space in a straight line. If a person whirls the ball too fast, the string may break and this straight outward motion will occur. The outward motion is called centrifugal ("center-fleeing") force. One can feel this outward-moving force when riding on a rapidly turning merry-go-round. The effect of centrifugal force on winds can be seen in rapidly rotating cyclonic storms. In these storms where wind speeds are high, there is a greater tendency of the air particles to continue moving in a straight line. So a balance among pressure gradient, Coriolis, and centrifugal forces must be achieved in order to maintain the cyclonic air flow.

The term used to define air flow balance among pressure gradient, Coriolis, and centrifugal forces is the gradient wind. Around a cyclone or center of low pressure in the Northern Hemisphere, the balance of forces leads to gradient winds that blow counterclockwise. Counterclockwise movement of air occurs because the pressure gradient force is directed inward toward the low pressure center and is balanced by the outward-directed Coriolis force, which deflects winds to the right in the Northern Hemisphere, and the outward-directed centrifugal force. In a cyclone the gradient winds blow at a slower speed than the geostrophic winds.

Around an anticyclone or center of high pressure in the Northern Hemisphere, the balance of forces leads to gradient winds that blow clockwise. Clockwise movement of air occurs because the outward-directed pressure gradient

Major wind systems of the world. Arrows indicate the usual paths taken by these winds.

force and outward-directed centrifugal force are balanced by the inward-directed Coriolis force. In an anticyclone the gradient winds blow at a faster speed than the geostrophic winds.

Since the Coriolis force deflects winds to the left in the Southern Hemisphere, the air flow is reversed in cyclones and anticyclones. In other words, air flow is clockwise around low pressure centers (cyclones) and counterclockwise around high pressure centers (anticyclones) in the Southern Hemisphere.

3. Global Winds

Westerly winds (winds flowing from west to east) generally prevail in the 30° to 60° latitude belt of both hemispheres (see figure). Active storms move eastward in these westerly wind belts. The westerly winds tend to be stronger in winter, especially between 40° and 60°N and S of the equator. In reality, the westerly winds are highly variable from day to day. Strong easterly winds (winds flowing from east to west) may occur from time to time near storm systems that are vigorous.

Easterlies tend to prevail between the westerly wind belts and the poles and between the westerly wind belts and the equator. The transition to tropical easterlies (northeast and southeast trade winds) occurs across the horse latitudes near 30°N and S, a zone of little average wind speed and abundant sunshine. The equatorial doldrums is a zone of light winds and occasional thunderstorms where the northeast and southeast trades converge (the Intertropical Convergence Zone).

The term monsoon applies to any seasonal wind. The great Asian landmass exerts a decided monsoonal effect. In winter a huge high-pressure center forms over the continent when the land is cooler than the surrounding water. The clockwise flow of air around the high represents a wind blowing off the continent. The resulting northeasterly flow over India and the

Arabian Sea (northeast winter monsoon) is cool and dry.

During the summer the great Asian monsoon reverses direction as a low-pressure center forms over the heated continent. The resulting southwest monsoon produces abundant precipitation over India, particularly where the moist airstream is forced to flow over the Western Ghats (mountains) and up against the foothills of the massive Himalayan mountains. The moisture source for the Indian summer monsoon is the Arabian Sea and the Indian Ocean.

Monsoon circulations, although not as dramatic as the Asian flow, are common in many other parts of the world. For example, the summer monsoon in the American state of Arizona corresponds to a period of hot and sultry weather with occasional thunderstorms from mid-July to early September. During this brief period moist air enters the southwestern United States from both the Gulf of California and the Gulf of Mexico.

The ocean responds to the prevailing winds as well. Subtropical high-pressure centers dominate the oceans between the prevailing westerlies and horse latitudes. In the prevailing northerly (southerly) flow of winds along the west coast of North America (South America), cold water from below the surface is brought to the surface by a process called upwelling. The Coriolis force is responsible for upwelling. Where the winds are northerly, the Coriolis force drives the surface water to the west (right). The warmer surface water is replaced by colder water from below. These conditions are good for fishing but bad for swimming. A famous area of upwelling in the Southern Hemisphere is off the coast of Peru in the strong southerly flow. The Coriolis force of the northward moving winds deflects the surface water to the west (left) away from the coast in the Southern Hemisphere. Normally the coastal climate is extremely dry because of the cold water. Every now and then because of

global wind changes (El Niño and the Southern Oscillation), the upwelling ceases as the southerly flow fails. Dramatic warming occurs, the fishing is temporarily ruined, and the arid coastal plain is inundated by heavy flood-producing rains.

4. Local Winds

Winds that affect only small regions are called local winds. Local winds depend upon the time of day and time of year. The position of highs and lows and the strength of the horizontal pressure gradient force also control the local winds. A familiar local wind is the land and sea breeze along the coast. A sea breeze is most likely under clear, sunny skies in the warmer part of the year. Air over the land is heated to a higher temperature than air over the water by day. In response the air pressure becomes a little higher over the relatively cool water. The horizontal pressure gradient force drives an on-shore push of cooler air. The sea breeze may penetrate 6 to 12 miles (10–20 km) inland. Along the coast temperatures may be 5°C to 10°C cooler than further inland. Sea-breeze wind speeds are typically 10 to 20 knots. At night the circulation reverses and a land breeze forms.

Mountain-valley winds are another familiar example of a local wind. After sunrise, the wind will begin moving up the valley and up the adjacent mountain slopes as a valley breeze. Air over the sunlit slopes is strongly heated by the ground. The air ascends rapidly and draws the surface air up the valley. The wind is gentle, usually less than 10 knots. After sunset, the mountain slopes lose heat very rapidly under clear dry conditions. The air in contact with the ground cools rapidly. The cooled air moves down the mountain slopes and down the valley as a mountain breeze. The wind may be briefly gusty with speeds of 10 to 20 knots or more in the early evening.

Mountains are also associated with much stronger and occasionally damaging winds. The katabatic (or cold fall) wind is similar in principal to the nightly downslope mountain breeze. The katabatic wind is far more intense because it is produced from a large mass of cold air over extensive highland regions. The cold air rushes down the side of the mountain as a gravity or density current. A katabatic wind off the Greenland icecap was responsible for the incredible 180-knot wind at Thule, Greenland, mentioned earlier.

Katabatic winds are known by a variety of names around the world. For example, in a *bora* along the Adriatic coast of Yugoslavia wind speeds may reach 100 knots. A similar cold air drainage wind known as the *mistral* can blow down the Rhône Valley in southern France. Because the air is rushing down the sides of a mountain it is dry and skies are typically sparkling blue over the lowlands during a *bora* and a *mistral*.

Warm, dry winds can also blow down from the mountains. The *chinook* ("snow eater") east of the Rockies or the *foehn* wind in the Alps occurs in winter whenever warm air over the mountains is forced to descend. As the descending air is compressed it is further warmed (1°C for every 328 feet, or 100 meters, of descent) and dried. Temperatures east of the mountains may rise 10°C to 20°C or more in a few hours once the westerly *chinook* wind starts to blow at 20 to 40

knots. Snow covers of 4 to 8 inches (10–20 cm) can disappear in a few hours due to a combination of melting and sublimation.

Mountain barriers can also act to channel the wind along them. The Rockies of North America represent a huge block to west-to-east flow. In summer, strong southerly winds east of the Rockies can carry moist air from the Gulf of Mexico northward into Montana and southern Canada, where its presence may lead to severe thunderstorms. In winter, bitter cold Canadian air is funneled rapidly southward east of the mountains on a strong north wind. In Texas and Oklahoma this type of cold north wind is called a *norther*. The *norther* may reach a speed of 40 knots, and it often raises clouds of dust.

On occasion the cold air driven by the north wind crosses the Gulf of Mexico and then rides up and over the Isthmus of Tehuantepec, Mexico, before reaching the Pacific Ocean at very low latitudes as a cold, gusty 20- to 40-knot northerly wind called a *Tehuantepecer*. A similar cold southerly wind east of the Andes in Argentina is called a *pampero*. The Australians use the name *southerly buster* to refer to a dramatic change to cooler conditions along the southeast coast of the continent (air temperatures may drop from 35° or 40°C to 20°C in one hour) as cooler air from the Antarctic Ocean rushes northward at speeds of 20 to 30 knots east of the coastal mountains (Australian Alps and Dividing Range).

Finally, there are winds of the desert. Desert winds tend to be very uncomfortable. They are hot and dry by day and cold and dry by night. Winds of 15 to 25 knots are common, and at these speeds large clouds of dust are raised and carried by the winds.

The *sirocco* is a hot, dry, dust-laden, southerly or southeasterly wind from the Sahara that forms ahead of cyclones moving eastward across North Africa and the southern Mediterranean Sea mainly during the spring. Air temperatures may exceed 40°C or approach 50°C in extreme conditions, in this airstream. A *sirocco* picks up a great deal of moisture and is cooled when it crosses the Mediterranean, and can bring rain and fog conditions to southern Europe. Under sunny conditions, the *sirocco* can produce temperatures in excess of 38°C in southern Europe. Various other names are used to identify the *sirocco* in specific localities. The *leveche* is the name of a local *sirocco* that originates in the Sahara and crosses the Mediterranean into southern Spain. A *khamisin* is the name of a local *sirocco* that originates in Egypt and moves eastward into the countries of the Middle East. This wind remains relatively hot and dry because it does not cross a vast expanse of water.

Two other desert winds of cyclonic origin are the *harmattan* and the *haboob*. A *harmattan* is a northeasterly wind from the Sahara that reaches the west coast of Africa in winter. The name *haboob* refers to very strong desert winds usually associated with dust storms in the African Sudan. These winds also occur in the Sonoran desert of southern Arizona in the United States. A *haboob* wind creates a whirling wall of sand as it picks up sand particles.

All of these and other local winds, however, respond to the global scale distribution of highs and lows and the resulting horizontal pressure gradient force.

WINDSOR, Duke of. See EDWARD VIII.

WINDSOR, win'zər, a town in Connecticut, in Hartford county, 6 miles (10 km) north of Hartford. It is situated along the Connecticut River and is bisected by the Farmington River.

Windsor is primarily a residential community. The manufacture of equipment for nuclear reactors is important to the economy. Other industries include insurance services and computer facilities. The raising of tobacco for cigar wrappers was phased out with the invention of a process for making wrappers by forming bits of tobacco into sheets.

The Loomis Chaffee School, a coeducational preparatory school created by the merger of the Loomis (boys) and Chaffee (girls) schools in the mid-1970's, is a leader in its field. The Fyler House, built in 1640, is representative of Windsor's rich history.

A group from Plymouth set up the first English post at the site of the town in 1633. In 1635 colonists from Dorchester, Mass., settled here, and in 1637 the town received its present name. Population: 27,817.

WINDSOR, win'zər, a town in central Nova Scotia, on an inlet of Minas Basin, about 37 miles (60 km) northwest of Halifax. The seat of Hants county, it is mainly residential with some light industries and tourism. Settled by Acadians in 1684, the town was called Pisiquid. It was renamed in 1764 after Windsor, England. In the 19th century the town's sawmills, tanneries, furniture factories, foundry, and gypsum mine provided a thriving economy.

The University of King's College (founded in Windsor in 1789), the oldest in Canada, moved its campus to Halifax in the 1920's. Clifton, the home of Thomas C. Haliburton, creator of Sam Slick, is now a museum. Population: 3,626.

WINDSOR, win'zər, a city in the province of Ontario in Canada. Canada's southernmost city, it is separated from the United States by the Detroit River and lies south of Detroit. It is located on a peninsula of rich, level farmland surrounded by Lakes Erie and St. Clair and the Detroit River, which joins the two lakes. Jutting deep into the U.S. industrial heartland, Windsor is an international gateway through which millions of visitors pass each year.

The city is connected with the United States by automobile bridge and tunnel, and by railway tunnel and ferry. It is served by five railways, four provincial highways, and the Macdonald-Cartier Freeway, which connects Windsor with Toronto and Montreal. Windsor is also a deep-water port near the midpoint of the St. Lawrence Seaway.

The Art Gallery of Windsor, the Cleary Auditorium and Convention Centre, which is the home of the Windsor Symphony, and the Hiram Walker Historical Museum are located in the downtown area near City Hall Square. The University of Windsor campus lies downstream to the southwest. The city's industrial parks on the eastern and western fringes are connected by an inland crosstown expressway, which passes close to the Windsor Airport. There are miles of recreational parkland along the scenic banks of the Detroit River.

History. French settlement of the area began in 1701 with Cadillac's founding of Detroit. Fol-

lowing the American Revolution, the French settlers were joined by English-speaking Loyalists. A ferry connection with Detroit led to the establishment of a hamlet around the ferry dock, which in 1836 the inhabitants named Windsor.

The arrival of the Great Western Railway in 1854 brought incorporation and growth. Other railways followed until the network was completed in 1910 with the opening of a railway tunnel under the river.

Other communities grew up along the river, including the distillery town of Walkerville and the automotive plant town of Ford City. Forming one socioeconomic community with no visible division between them, these towns were collectively referred to as the Border Cities.

Scores of U.S. firms took advantage of favorable tariff policies to establish branch plants in the area. In 1904 the Ford Motor Company of Canada was established, creating the industry that would make the area the "Auto Capital of the British Empire." Propelled by unprecedented prosperity and employment opportunities, the population of the Border Cities passed the 100,000 mark in the 1920's. The work force possessed a high percentage of foreign-born. The opening of the Ambassador Bridge and the Detroit-Windsor Auto Tunnel (1929) signaled the arrival of the automotive age.

With the Great Depression, immigration ceased and unemployment reached 30%. The provincial government intervened to force the amalgamation of the Border Cities into Greater Windsor.

Recovery began with the production of war materials in World War II, and the postwar demand for automobiles brought employment and population gains. By the late 1950's, however, the number of auto workers had dropped to nearly half, industries relocated nearer the center of the Canadian market, and a reputation for labor militancy threatened Windsor's future.

Attempts were begun to diversify the economy and improve the image of the city. Renewal was furthered by the arrival of a new professional class attracted to the city by the opening of the University of Windsor in 1963 and St. Clair College in 1967 and by the growth of the service sector. The newly arrived white-collar professionals altered the labor and blue-collar image of this industrial city. The decades that followed the U.S.-Canadian Autopact agreement and Windsor's annexation of its suburban fringes, both in the 1960's, restored the city's population and industrial growth. Population: 193,111.

LARRY L. KULISEK
University of Windsor

WINDSOR, win'zər, a town in eastern Vermont, in Windsor county, on the Connecticut River, 13 miles (21 km) north of Springfield. It is situated at the foot of Mt. Ascutney, a ski area.

Windsor has been called the birthplace of Vermont. Chartered by New Hampshire in 1761, the town was named for John Stuart, earl of Windsor. After Vermont declared itself an independent republic on Jan. 15, 1777, a convention at Windsor adopted a constitution on July 8.

Historic buildings include Constitution House (1772), where the convention met, and Old South Church (1798). Population: 3,714.

WINDSOR, House of, the name by which the British royal family is known. On June 20, 1917,

after three years of war with the Central Powers, King George V made the first of two moves designed to show that the royal family shared the emotions of the peoples of the British Empire. He announced that the princes of his family who were British nationals but bore German titles should give up the German titles and assume British names. On July 17, 1917, relinquishing all German titles for himself and his family, the king proclaimed that the royal house would no longer be known as Saxe-Coburg-Gotha or, as they were popularly but incorrectly known, Hanover or Brunswick, but as Windsor.

Between July 16 and 18, 1917, the king created the elder and the younger brothers of his wife, Queen Mary (born a princess of Teck), respectively marquess of Cambridge and earl of Athlone. Similarly, the two Battenberg princes (renamed Mountbatten), one of whom married a granddaughter of Queen Victoria and the other Queen Victoria's youngest daughter Beatrice, were created respectively marquess of Milford Haven and marquess of Carisbrooke.

The British royal family, though of ancient lineage, now bears the newest name among royal families, whether reigning or dethroned. Its previous designation derived from the marriage of Queen Victoria to her cousin Albert of Saxe-Coburg-Gotha. The sovereigns of this house were Edward VII and George V (until 1917). Victoria herself was the last of the Hanoverian line, which had reached the throne in 1714, on the death of the last Stuart sovereign, Queen Anne. The first Hanoverian king was George I, elector of Hannover, descended from the marriage of James I's daughter to the elector palatine.

In renaming the royal house Windsor, neither logic nor sentiment dictated the choice. The only sovereigns born at Windsor were Edward III (1312) and Henry VI (1421), though many have

died there, William IV most recently (1837). Elizabeth II descends from Edward III, but only collaterally, since she does not derive from an heir male of his body. The connotation of the name Windsor was further complicated when, on March 8, 1937, the former Edward VIII, three months after abdicating, was created duke of Windsor, a title that had not hitherto been used for a dukedom, royal or otherwise. At this time the duke was tacitly *persona non grata* in his former kingdom.

On Feb. 8, 1960, it was declared by royal decree that the descendants of Elizabeth II and Prince Philip, duke of Edinburgh, were to be known as Windsor-Mountbatten. The Mountbatten element honors the queen's husband (born Prince Philip of Greece), whose mother was the eldest daughter of Louis of Battenberg, a German prince who became a British subject during World War I, changing his name to Mountbatten and being created marquess of Milford Haven. The same royal decree ruled that the royal house would continue to be known as Windsor.

WALLACE BROCKWAY,

Consultant to the Bollingen Foundation.

WINDSOR CASTLE, at Windsor, England, a royal residence of the monarchs of Great Britain, built along a steep ridge above the north bank of the Thames River, 22 miles west of London. It was founded by William the Conqueror, largely rebuilt by Edward III, and further altered by later monarchs. The castle is nearly 1 mile in circumference—the largest in Britain—and the view from the Round Tower embraces portions of 12 counties.

The Round Tower divides the castle into the Lower Ward, to the west, and the Upper Ward, to the east. In the Lower Ward are Albert Memorial Chapel, begun by Henry VII and rebuilt by Victoria, and St. George's Chapel, a magnifi-

Windsor Castle, showing the houses of the Military Knights at left, Henry III's Tower (center), and the Round Tower (far right).

J. Allan Cash, London

cent Perpendicular building begun by Edward IV and completed by Henry VIII. St. George's Chapel is famous for its fan vaulting, for the banners and stalls of the Knights of the Garter, and as the burial place of numerous monarchs and royal personages, including Henry VIII and Jane Seymour, Edward VII and Alexandra, George V and Mary, Charles I, and George VI.

The Upper Ward contains the State Apartments, the monarch's private apartments, the visitors' apartments, and a priceless collection of paintings, drawings, and other art treasures. North and east of the castle is Home Park, comprising about 500 acres. In it is the Royal Mausoleum, where Queen Victoria and Prince Albert are buried. South of the castle is Windsor Great Park (about 1,800 acres), with its fine old trees, traversed by the Long Walk, at the end of which is Snow Hill, commanding a magnificent view of the castle.

Author of "English Place-Names"

WINDTHORST, vīnt'hōrst, Ludwig, German statesman; b. Kaldenhof, near Osnabrück, Hannover, Jan. 17, 1812; d. Berlin, Germany, March 14, 1891. After studying at Göttingen and Heidelberg universities he practiced law at Osnabrück and in 1842 became president of the Roman Catholic board for churches and schools in Hannover.

After the revolution of 1848, he was elected to the Hannover Parliament, becoming president of the lower chamber in 1851 and minister of justice (1851-1853, 1862-1865). After Hannover was annexed by Prussia in 1866, Windthorst was a member of the Prussian Landtag and the German Reichstag. He helped to form the Center Party, consisting largely of Roman Catholics, and was its leader after the death (1874) of Hermann von Mallinckrodt. In this capacity he conducted the fight against Otto von Bismarck's anti-Catholic measures during the Kulturkampf of the 1870's and led the resistance to the Prussianizing of Germany, but later supported many of Bismarck's social and economic programs. Under his leadership, the Center Party became the largest in Germany, remaining so for some 20 years after his death.

WINDWARD ISLANDS, wīnd'wōrd, island group, Lesser Antilles, between the Atlantic Ocean on the east and the Caribbean Sea on the west, extending from 12° to 15° 40' north latitude and from 60° 48' to 61° 48' west longitude. The Windwards are the southernmost islands of the Lesser Antilles chain, with a total land area of about 1,250 square miles. They consist of five large islands—from north to south, Dominica, Martinique, St. Lucia, St. Vincent, and Grenada—and a group of small islands, the Grenadines, which lie between St. Vincent and Grenada and are divided between them for administrative purposes.

Except for Martinique, an overseas department of the French Republic, the islands belong to the West Indies Associated States of the Commonwealth of Nations. Each of the four large Commonwealth islands is a unit member thereof, with its own Legislative Council, administrator, revenues, and tariffs.

The following account deals only with the British-associated islands in the group; see also separate article MARTINIQUE.

Of volcanic origin, each of the large islands has a mountainous central rib, running from north to south and lying between coastal plains. The dry season (January to May) brings temperatures of 70° to 80° F. During the remainder of the year temperatures rise and humidity increases. Rainfall averages 60 to 70 inches on the coastal plains but rises to as much as 250 inches in the interior. Heavy damage frequently results from the hurricanes that come between the months of June and October.

The economy is agricultural, the principal exports being bananas, cocoa, cotton, spices, arrowroot, copra, and lime juice. There are no railroads, and the terrain hampers road building. Each island has its own airfield and is linked with neighboring islands and the mainland by regular air services.

Dominica was discovered by Christopher Columbus in 1493, and the discovery of the

Location map of the Windward Islands.

others, also by Columbus, came within the next decade. Spain, Great Britain, Holland, and France planted settlements on the islands. Sovereignty over Dominica, St. Vincent, and Grenada was given to Great Britain in 1783 by the Treaty of Versailles. St. Lucia came under British rule in 1814 at the close of the Napoleonic Wars.

The population of the Windwards is mixed, resulting from intermarriage among African slaves, East Indian indentured laborers, Portuguese workers, French and British settlers, and the indigenous Arawaks and Caribs. Pop. (1980 est.) 737,000.

See also WEST INDIES, THE; and separate articles on individual islands.

RICHARD E. WEBB

WINDWARD ISLANDS (Fr. ILES DU VENT), island group, South Pacific, forming the eastern part of the Society Islands, in French Polynesia, an overseas territory of the French Republic. The principal islands are Tahiti and Moorea. Papeete, capital of the territory, is on Tahiti. See also SOCIETY ISLANDS.

WINDWARD PASSAGE, ocean channel in the Antilles, between easternmost Cuba and the northwestern prong of Haiti (Hispaniola Island). The strait, approximately 50 miles wide, joins the Caribbean Sea with the Atlantic Ocean, and is on the direct route for ships from the east coast of the United States to the Panama Canal.

FENNO JACOBS/PHOTO RESEARCHERS

Bottled wine is stored and aged in the cellars of Louis Latour, in Beaune, France.

WINE, win, the fermented juice of the grape. The word *wine* comes from the Latin *vinum*, akin to Greek *oinos*, which means grape wine and, in a larger sense, the fermented juice of other fruits. The French, who make the greatest wines on earth, in 1905 passed a law that said: "No drink may be kept . . . or sold under the name of *vin* that is not exclusively produced from the fermentation of fresh grapes or the juice of fresh grapes." The emphasis is on "fresh." There had been some earlier trouble when dried grapes (raisins) were imported and used in the making of wine. In Italy, the law of 1925 calls *vino* "the product of the alcoholic fermentation of the juice of grapes, either fresh or slightly dried." The German wine law of 1930 follows the stricter French definition.

Wine drinkers, wine lovers, and wine connoisseurs would hardly agree with such prosaic definitions. Wine, they say, is a living thing, not only to be drunk, but to be enjoyed. King Edward VII of Great Britain once said, "Not only does one drink wine, but one inhales it, one looks at it, one tastes it, one swallows it . . . and one talks about it."

Wine is a product of the earth—*le terroir*, as the French say—and of the sun, but it is also a work of art, for it is made by man and is often a matter of erudite judgment. Of the 5 to 6 billion gallons of wine made each year in the world (about 2 gallons for each human being), much is still made the way Noah made it. But the finest wines are partly the result of technical know-how and great vinicultural improvements. Never before have there been so many good wines on earth. The present is the golden age of wine.

1. European Wines

There are many ways of distinguishing and classifying wine. One may speak of dry and sweet wines: of table wines that are drunk with meals, and of fortified wines that are drunk before and afterward. Table wines are either red, white, or rosé (pink). White wines are not water white, but yellowish green, and often are made of black grapes. One can also distinguish still wines and sparkling wines, the greatest of which continue to be produced in the old French province of Champagne, around Épernay and Reims.

France.—The greatest wines on earth come from France, where one Frenchman in every seven earns his living making wine. France is blessed with many great wine regions. There is the Champagne country east of Paris, and the territory of the Alsace and Jura wines near the eastern borders. South of Champagne are the vineyards of Burgundy, which go all the way down to Lyon, and farther south begin the vineyards of the Rhône Valley. In the southeastern part of the country are the lesser wine districts of Provence. Southwest of Paris are the wines of the Loire Valley, and below is the greatest wine district of France and the world: Bordeaux. The English, who are among the oldest Bordeaux connoisseurs, call the red wines of Bordeaux clarets.

Bordeaux.—There are hundreds of great vineyards in the Bordeaux region, but the best known, and some of the greatest, were singled out by the famous "classification of the great growths" in 1855. Only four were given the supreme accolade of *premiers crus* (growths): Château Lafite, Château Latour, Château Margaux, and Château Haut-Brion. The greatest sweet white wine of Château d'Yquem was called *grand premier cru*. The classification is thought by many people to be outdated and unrealistic. There are *second cru* wines, like Château Mouton-Rothschild, that often fetch higher prices than the *premiers crus*, and there are very great wines in the other districts, especially St.-Émilion and Pomerol, which were not classified at all. Château Cheval-Blanc in St.-Émilion and Château Petrus in Pomerol have made incomparable wines. Altogether Bordeaux produces almost 80 million gallons of wine annually from about 185,000 acres of vineyards, and three quarters of these wines are of *appellation contrôlée* quality, from vineyards whose borders are exactly defined by law. The regions of Médoc, St.-Émilion, and Pomerol produce only red wines; Graves, south of the city of Bordeaux, produces red and white wines, and the districts of Sauternes and Barsac make the finest sweet white wines on earth.

In Bordeaux, "château" means vineyard or estate; the Bordeaux "châteaux" have nothing in common with the châteaux of the Loire country. In addition to the four *premiers crus*, Médoc produces 15 second, 14 third, 11 fourth, and 18 fifth *crus*, but this is not always a scale of quality, for there are no inferior wines in Médoc; some are just better than others. After the classification of 1855, hundreds of other vineyards were classified into "bourgeois," "artisan," and "peasant" growths, and the "bourgeois" growths were divided into two parts.

The great clarets have inspired poets and experts for centuries. Bordeaux are the "queens" of wines, because they are more delicate and

feminine than the heavier-bodied, masculine Burgundies, which lack the extreme finesse of the great clarets but make up for that by their bouquet.

Burgundy.—Wine making began in Burgundy 2,500 years ago, and ever since the Burgundians have declared the superiority of their great wines. The greatest of the red ones are Romanée-Conti, Clos de Vougeot, and Chambertin, said to be the favorite wine of Napoleon I. There has never been enough Burgundy for all who want it, and as a result there has been a lot of blending and "stretching." It is harder to buy a first-rate Burgundy than a first-rate Bordeaux, for which the sentence "*Mis en bouteilles au Château*" is always a sign of guaranteed quality. Burgundy labels sometimes but not always carry the wording "*Mis en bouteilles par le propriétaire*" or "*Mis au Domaine*."

The greatest red and white wines of Burgundy come from the Côte d'Or, a ridge south-southwest of Dijon. The northern part of this ridge, called Côte de Nuits, produces three quarters of the great red wines, the southern part, the Côte de Beaune, makes some reds and the great white wines. Greatest of the white wines are those of Montrachet, whose 19 acres produce less than 1,000 cases in a good year. The proprietors keep about 250 cases and sell about 250 to friends, so that less than 500 cases are available for sale and it is very hard to find an authentic Montrachet. In the northern part of Burgundy are the famous vineyards of Chablis, the best of the Chablis Grand Cru are very fine. South of the Côte d'Or are the Chalonais, Mâconnais, and Beaujolais wines. The Beaujolais is one of the most popular red wines on earth, it should be drunk when young. The best Beaujolais comes from Juliénas, Moulin-à-Vent, Fleurie, Chénas, and Morgon.

Other Districts.—The wines of the Rhône Valley, from Vienne to Avignon, are sun-drenched red, and sturdy: Côte Rôtie, Hermitage, Châteauneuf-du-Pape. A good white Rhône wine is the Condrieu. There are charming dry white wines in the Loire district (Pouilly-Fumé, Sancerre, Vouvray), and pink and white ones in Anjou. There are well-known white wines from the vineyards of Alsace on the left bank of the Rhine, but not quite so good as the German Rhine wines. The best are the Rieslings, followed by the Gewurz-Traminer. There are lesser wines from the Jura, Savoy, the Pyrenees, and Provence.

Germany.—Among the world's wine-producing countries Germany ranks far down in quantity, but the best German wines come close to the top French ones. The greatest German wines are the greatest of all, in the opinion of hock connoisseurs. They are made with painstaking care by people dedicated to their art; the finest of them are more expensive than the best French wines. The great Rheingau wines, from the north bank of the Rhine between Rüdesheim and the neighborhood of Mainz, include the celebrated Johannisberger Kabinett. They are made from overripened grapes (*Beerenauslese*), selected grapes from selected bunches (*Trockenbeerenauslese*), and late pickings (*Spätlese*).

The wines of Rheinhessen, south of the Rhine and southwest of Mainz, are not quite so good as those of the Rheingau—milder, softer, lighter in taste. The wines of the Palatinate (Rheinpfalz) have neither the delicacy nor the long life of the most famous Rhine wines. But the great

Moselle (Mosel) wines are a different story. They mature quickly, are best drunk when they are about 4 years old (Rhine wines may be 10 times as old), and the best have a luscious, magnificent bouquet; the great Bernkasteler, Piesporter, or Wehlener wines are among the world's greatest.

Spain and Portugal.—The vineyards of Spain, blessed by sunshine year after year, produce almost 500 million gallons of table wines annually, 17 gallons per person, and many of them are quite good. The country produces one great wine, sherry from Jerez de la Frontera, just up the coast from Gibraltar. Sherry is "fortified" (extra alcohol is added) and "blended" (heavy wines are balanced with light ones, acid with delicate ones). The most popular fortified wine, it has been called "unique" and "inimitable" by the British, and is mostly an Anglo-Saxon drink, more sherry is bottled in London, Liverpool, and Bristol than in Spain. The finest sherries are called Finos (pale and dry), Amontillados (not quite so dry), Olorosos (rather sweet, rather dark), and Amorosos (paler and sweeter than Olorosos). Sherry is a magnificent wine for cooking.

Portugal is famous for port, most of which goes to England. In England "port" means wine made in a closely specified area of the upper Douro Valley in northern Portugal. Vintage port is dark ruby, with an intense, fruity taste, the product of a single year. English connoisseurs drink vintage port only when it is at least twenty years old. Blended port, "Port from the Wood," is a blend of ruby and tawny ports, less expensive and less outstanding in quality than vintage port.

The best wines from the Madeira Islands can live for a century. In London, with some luck, one can still purchase the vintages of 1789 and 1795. The best vineyards are near Funchal, the capital. Good Madeira has a caramel-like flavor and will keep its freshness only for a short time after the bottle is opened.

Italy.—Italy produces over a billion gallons of wine each year. Most of the wines are good ones, but few are great. Italian wines that are exported are *vini tipici*, wines "true to type," full and hearty. Everybody in Italy drinks these wines; nobody bothers about vintages. The finest Italian wines come from the Piedmont in the north, resembling somewhat the Rhône wines. The best known are the red Barbaresco, Barbera, and Barolo, and the white Asti Spumante, Caluso, and Cortese. The best known of all Italian wines is Chianti from Tuscany. The best Chiantis are always shipped in bottles (not in straw-covered *fiaschi*) and, if they are genuine, can be very good. Lombardy and Liguria make the red Grumello, Inferno, and Sassella, and the white Cinque Terre. South Tyrol makes a pleasant rosé, Santa Maddalena, and Merano's light, lovely Küchelberger (di Collina). From Lago di Garda come red Bardolino and Valpolicella; from Terzano, a fine white wine by the same name. Emilia-Romagna produces vast quantities of undistinguished Lambrusco and Albana, and there are the dry or fruity Orvieto and the Frascati which Horace praised because he did not know better. Italian wines are meant to be drunk and enjoyed casually, without sipping, tasting, or fussing.

Choice and Use of Wines.—One man's wine is another man's poison. A man should drink the

wine he likes best. It takes a long time to learn about wines; real knowledge comes only after years of intelligent tasting and drinking. It is easy to distinguish a poor wine from a great one, but very, very difficult to distinguish two great ones and even more difficult to describe the difference. The French always drink wine with their food; the Germans often leave their finest bottle until after dinner. Most Frenchmen drink wine every day of their adult lives, but it is rarely a great wine, and often only an ordinary *pinard*. There are no hard and fast rules as to which wine should be drunk with what, but there are a few truisms that have been born out of experience.

Dry white wines go best with *hors d'oeuvres*, fish, shellfish, and oysters: Chablis, Pouilly-Fuissé, Puligny-Montrachet, Chassagne-Montrachet, Sancerre-Sauvignon, Vouvray *sec*, Graves *sec*, Tavel, Hermitage *blanc*, Montrachet, Alsace, most hocks, and all Moselles.

With white meat and fowl, serve red Bordeaux from the Médoc or Graves regions, Beaujolais and light red Burgundies; or Chinon, Arbois, Bourgueil. With red meat, game, *foie gras*, and cheese, serve Pomerol, St.-Émilion, Néac; Beaune, Pommard, Volnay, Corton, Nuits-St.-Georges, Clos Vougeot, Musigny, Romanée, Chambertin; Moulin-à-Vent, Morgon, Julienas; Hermitage *rouge*, Côte Rôtie, Châteauneuf-du-Pape. Some people are addicted to sweet wines, but they should be served only with dessert and fruit: Anjou, Monbazillac, Sauternes, and some Rhine and Alsatian wines.

The first rule in wines, however, is that there is no disputing tastes. The proprietor of Château d'Yquem, the greatest sweet white wine on earth, drinks his wine even with fish (and likes it). There is an old dictum that *brut* champagne can be drunk with everything from *hors d'oeuvre* to dessert, but there are people who cannot (and must not) drink champagne. One good rule is never to follow a fine wine with a poor one, or a heavy wine with a light one. The French gourmet Anthelme Brillat-Savarin (1755-1826) said, "The order of food in a dinner is from the more substantial to the lighter, for the appetite is appeased in eating." With the accompanying wines, it is the other way around: they begin with the lighter ones and gain in intensity, body, and age.

The vintage myth is, like all myths, based on sound facts. Wine is sunshine caught in the grape. When the weather is sunny, there will be more sunshine in the grapes and more sugar; and it is the sugar in the grape that ferments to form alcohol. In some years, like 1945, there is good weather everywhere, and great wines are made in many vineyards all over Europe. The 20th century's great vintage years in red Bordeaux were 1953, 1952, 1947, 1945, 1934, 1929, 1928, 1924, 1904, and 1900.

Purchase, Care, and Serving.—Buying wines is difficult and beset with traps. It is easy to buy a great bottle of Château Cheval-Blanc (because it is château bottled), but it will be costly. The value of wine is always relative. If a bottle of wine is bad, even a low price is too much.

One of the secrets of enjoying wines is to have an honest, reliable wine merchant. Much wine is exported in barrels and bottled in other countries, and sometimes strange things happen. Delicate, low-alcohol wines travel less well than

others. The ocean voyage adds a year or two to the age of the wine. The trick is to buy wines when they are young and relatively inexpensive, and store them until they are ready to be drunk.

More wines are ruined by being drunk too late than too early. The 1944 clarets were ready to be drunk 10 years later, when many of the 1937 reds, because of their great amount of tannin, were not yet ready to be opened. Half bottles are all right for trying out an ordinary wine, but great wines suffer from being in half bottles. They are better in a magnum (double bottle) than in the ordinary bottle.

Wine bottles must be stored lying down so that the bubble of air within the bottle is clear of cork. If the cork dries out, air will carry acetobacter and other organisms into the bottle and ruin the wine. It makes no difference whether the "cellar" is a large room with indirect lighting or a small wooden box, if only a couple of bottles are kept in it. But it should be free from vibrations and rather cool. The ideal temperature is between 50° and 55° F. Dampness should be avoided; darkness is best.

Red wines often cast a deposit, and care should be taken to bring the bottle from the cellar to the table without disturbing the sediment. The neck of the bottle should be wiped clean and the cork removed, so that no bits of cork drop into the wine. The wine should be served at proper temperature: white wines should be cooled slowly and gradually (chilled but not frozen); red wines should be brought up in time, opened, and allowed to warm gradually to room temperature. They must never be placed near a hot stove, or the wine will "break." Champagne is usually served quite cool. It is the great wine for festive occasions.

Fine red wines of old age should stand upright for several hours before they are decanted or served, to give the sediments time to settle back to the bottom. Improper handling can ruin the finest wine. Many people prefer to decant old wines, pouring carefully, with a light behind the bottle, so that they see when the sediment comes out and they must stop. Old wines should be opened at least half an hour before they are served; the wine wants to breathe. It is absolutely unnecessary to use baskets. The glasses should be large; great wines are easily ruined by small glasses. Glasses should be tulip shaped, clear, and thin, without markings or etchings. They should be less than half filled to permit the full enjoyment of the color, bouquet, and taste of a fine wine.

Sherries should be drunk when they are freshly bottled; on the other hand, a sturdy sherry will remain good in the bottle for weeks after it is opened. Everyone seems to agree that sherry is the only wine that may be drunk while one smokes; some say that tobacco actually enhances the taste of the wine. It should be served in a "sherry sampler's" glass, never more than two thirds filled. A dry sherry is a classic aperitif. A vintage port is a fine way of concluding a great meal. The greatest vintage port still available is 1896. Other great years were 1900, 1904, 1908, 1912, 1917, 1927, 1931, 1934, 1935, 1947. As to Madeira, it lasts longer than any other wine; a great Madeira never comes of age. It is good to serve with dessert.

JOSEPH WECHSBERG.

2. American Wines

California and New York are the leading wine producers in the United States. Wine is also made in some of the midwestern and Middle Atlantic states. The United States produces both red and white wines, rosés, fortified wines, such as Port and Muscatel, sparkling wines and champagne, native fruit wines, and "pop" wines. The table wines contain 11% to 14% alcohol, while the wines fortified with brandy may contain from 17% to 20%. They are taxed according to their alcoholic content.

American wines are unique and different, but considered by some authorities to be as fine as the wines of Europe and France. It is difficult to distinguish between an American Chardonnay and French White Burgundy. In blind taste-testing by experts, many of the American wines have proved equal, or superior, to their famous European counterparts.

Labeling, not quality, is largely to blame for the slow acceptance of American wines. The standards for labeling wines in America are not the same as those for labeling in France. Therefore two bottles of wine with the same *generic* label may be two completely different types of wines that cannot be compared. Most of the American wines are *varietals*, and the *generic* French names indicating the district where the wine is made in France, are not applicable to American wines, and yet some of the names have been carried over.

The trend in the industry now is to pull away from the *generic* names, so that the American wines will no longer be compared with the European wines bearing the same name, but unrelated in quality. The *varietal* identification on the label of an American wine bottle means that the contents were made from at least 51% of that particular grape. The wine may also contain a blend of other grapes to enhance its color, its aroma, or its flavor.

The finest white wine in America is Chardonnay. It compares with the aristocratic French Chablis. American Chablis, on the other hand, is a white table wine made from a blend of white grapes, but does not contain the expensive, hard-to-grow Chardonnay, so it is in no way the equivalent of French Chablis, nor does it pretend to be. The wineries are gradually changing the identification of American Chablis to "White Table Wine" to avoid this confusion.

The finest red wines in America are made from either Cabernet Sauvignon or Pinot Noir. These wines compare with or surpass the red Burgundy of France which is also made from the Pinot Noir grapes. American Burgundy is an inexpensive blended red table wine, in no way related to the French Burgundy. As in the case of Chablis, American wineries are changing the labels to read simply "Red Wine."

Perhaps the greatest controversy with the European market comes from the sparkling wines made in the United States under the label of "champagne." French vintners are anxious to initiate international controls that would eliminate the confusion that exists in labeling, but such controls would give that country a monopoly over the production of champagne.

A number of American champagnes are made by the traditional French *méthode champenoise*, which requires that the second fermentation

COURTESY OF CHRISTIAN BROTHERS

The Napa Valley of California is blessed with a mild climate that is ideal for growing wine grapes.

(which produces the bubbles) take place in the bottle. The inverted bottles must then be hand-turned over a period of many months. The yeast sediment that collects in the necks of the bottles is disgorged in a bottle-by-bottle process. A more modern process empties all the bottles mechanically after the second fermentation so that the entire batch may be filtered and rebottled.

A second, less-expensive process is employed by many wineries in America for the making of champagne. This is known as the "Charmat" or "Bulk Process," in which the second fermentation takes place in bulk rather than in the bottle. It is quite acceptable for beverages made by either process to be called "champagne" in America, but those produced by the Charmat method must so indicate on the label. In France only sparkling wines made by the traditional method in the Champagne district (where the Charmat process is forbidden) may be called, and sold as, "champagne." Anything else must be labeled "sparkling wine."

Other labeling misconceptions include the Fumé Blanc or Napa Fumé, a name taken from the Sauvignon Blanc of the Loire Valley, which acquires smoky characteristics as it ripens. American winemaker Robert Mondavi liked the sound of the French word *fume* (meaning smoke), so he used it to name a delightful, very dry, American white wine that has no connection with the French Sauvignon Blanc. Also, Chianti, which is a fine wine in Italy, is a popular, ordinary wine in a fancy bottle under its American label. An-

other example is Grey Riesling which is not related to the German Riesling grape whatsoever.

California. The California wines more closely resemble the wines of Europe because they are made from the *V. vinifera* brought to this country from France. In many instances, however, the bouquet is enhanced by a blend of native grapes as well, giving it a special unique quality that is American. Some of the finest wines in the country, including the Chardonnay and Cabernet Sauvignon, come from the Napa Valley. Other wine producing districts in California include the San Joaquin Valley, Lodi, Sacramento, Santa Clara, Alameda, Contra Costa, and Solano. The ideal variables of the California climate make it easier to grow *Vinifera* in that state than in any other part of the world.

One of the state's most distinctive wines, however, is made from native grapes called Zinfandel. The wine from these grapes may be made in several different ways, varying from a fresh young wine to a late-harvest wine with a complexity of flavors and a 15 to 17 percent alcohol content.

New York. The Finger Lakes district of New York is the largest wine-producing area in the United States outside of California. The Grape Belt extends from Lake Erie southwestward to the Pennsylvania border in a narrow strip that varies from three to sixteen miles wide. The grapes grown here and in other wine-producing sections of the East are mainly *V. labrusca*, particularly Concord, which produce a "foxy" or fruity taste. A wine carrying the New York state label may contain up to 25% of the juice of grapes from other states, which enables the wineries to develop a blend that lowers the "grape jelly" flavor of the Concord grape wine. Other native grapes used in New York state wines made with native grapes, and so labeled, are Delaware, Moore's Diamond, Niagara, Dutchess, Missouri Riesling, Vergennes, Isabella, and Catawba, all of which have a predominant *labrusca* taste.

In recent years the development of French-American hybrids such as De Chaunac and Seyval Blanc has become an exciting innovation in the wine-making industry. The results are native hardiness and resistance to disease combined with the delicate flavor of the French *V. vinifera*. These hybrids have made it possible to begin the production of *Vinifera* in sections of the country where they previously would not grow.

New York state is also prominent in the production of "pop" wines. These carbonated wines with 8% alcohol content are a teenage transitional beverage between soft drinks and wines. They may be cherry, peach, apple, or grape flavored and have names like Strawberry Hill, Apricot Splash, and Tickle Pink.

Midwest. Ohio and Michigan are the leading wine-producing states in the Midwest. At one time Cincinnati was the heart of the Ohio wine country, but its Catawba vines were destroyed by disease and were never fully restored. The vineyards of Ohio are now found along the shores of Lake Erie from Sandusky to the Pennsylvania border.

Paw Paw is the center of the Michigan wine country where most of the grapes grown are native Concord. Michigan's chief contribution to the wine-drinking world is Cold Duck, which

began in Detroit as a bar drink. Cold Duck, a sparkling wine that was popular in the 1960's, gets its name from Germany where partygoers at the end of the evening would pour the remains from their bottles into one container, and, in a pun on the words *kalde ende*, meaning "cold end" or "leftover," call it *kalde ente* or "cold duck." Cold Duck is literally that, a combination of sweet sparkling red and white wines.

Vineyards were first planted in Missouri in Hermann in 1843, and winemaking is still conducted in the Ozark Mountains of both Missouri and Arkansas.

Midwestern states are also known for their fruit wines. Wisconsin makes a cherry wine, and Michigan produces strawberry, peach, and apple wines. Rhubarb wine is made in Iowa. Most of these are served as cordials or as a dessert over fresh fruit.

Middle Atlantic States. Most of the *Vinifera* planted in the Middle Atlantic states did not survive, so the wines made here now are from native grapes, such as *Labrusca* in Virginia and Catawba in Maryland. New Jersey makes great quantities of all kinds of wines, both still and sparkling, and Scuppernon may still be found in limited quantities in the southern coastal states.

Choice and Use. As the wine industry comes of age in America, the wines that are made there are being recognized as American, and generic names which have been inappropriately applied in the past, are falling into disuse. The wines instead are identified by their *varietal* names, and should not be ordered by names corresponding to the European generic labels. Chardonnay is equivalent to French Chablis, but American Chablis is a white table wine. French Burgundy is equaled in America by Cabernet Sauvignon or Pinot Noir, but American Burgundy is a blended red table wine. Since American wines do not imitate the winemaking district in France for which they were originally named, they should be selected on their individual basis, as they are uniquely American.

American white wines such as cocktail sherry, Chardonnay, Seyval Blanc, and Pinot Blanc are served with appetizers. Red wines including Baco Noir, Barbera, Petite Sirah, Cabernet Sauvignon, Pinot Noir, Foch, Chancellor, and Zinfandel are appropriate with a variety of cheeses, including cheddar. Cold buffet foods are accompanied by dry rosé, Gamay, Gamay Noir, or Pinot Noir.

White wines to accompany fish and seafood include Emerald Riesling, White Riesling, Seyval Blanc, Gamay, Chardonnay, Chenin Blanc, dry Sauvignon Blanc, or Rosé of Pinot Noir. Red wines served with meat or game include Cabernet Sauvignon, Pinot Noir, Petite Sirah, Chancellor, Chelois, Ruby Cabernet, Zinfandel, Baco Noir, and Barbera.

American white wines that are served with pork, ham, chicken, and turkey include Chenin Blanc, Gamay, Gamay Beaujolais, Sauvignon Blanc, Pinot Blanc, Vidal Blanc, Seyval Blanc, White Riesling, Emerald Riesling, and Delaware. Sweet or semi-sweet dessert wines include Aurora, Catawba, sweet Chinen Blanc, and Malvasia Bianca. Gewürztraminer goes with spicy foods, sausages, Virginia-style ham, and seafoods or fish in rich or seasoned sauces.

HELEN POWERS

This modern crushing and fermenting plant in California makes it possible for the winery to ferment a great variety of wine grapes with exact control of factors such as the temperature and the duration of fermentation.

3. Production

Most of the wines of the world are the product of the alcoholic fermentation of grapes. Some wines, however, are made from other fruits or from berries and are designated by the name of the fruit; for example, peach wine and blackberry wine.

Raw Material.—The composition of the grapes has a very important influence on the composition and quality of the fermented wine. Varieties of *V. vinifera* normally attain about 18 to 24 percent of sugar in the temperate zones. This is sufficient to produce a stable wine of about 10 to 13 percent alcohol (by volume) after fermentation. However, in the more northern areas of the temperate zone (for example, Burgundy in France and on the Rhine in Germany), *V. vinifera* does not ripen sufficiently to produce even 18 percent sugar, and in order to make a stable wine it is necessary to add sugar to the grape juice (must) before fermentation. Also, in the eastern United States, the native varieties and hybrids used usually do not attain sufficient sugar to make a balanced wine, and addition of sugar is common. In Europe, where the climate varies rather markedly from year to year, no sugar may be added to the grapes produced in very warm years, while in very cool years a considerable amount of sugar must be added. Obviously, wines produced without addition of sugar are of higher quality. This is one of the reasons why the wines of northern Europe differ in quality from year to year. Another reason is that the acidity also varies, depending on climatic conditions; in the cooler years more acidity is retained than in warm years. Therefore, even though there may be sufficient sugar for a balanced wine, the variations in acidity will cause the wines of the warm years to be different from those of the cooler years. There are also poorly defined differences in the aroma constituents in grapes between the warm and cool seasons.

The vineyardist must watch carefully the ripening process of the grapes so that they can be harvested at their optimum maturity—if they

can reach optimum maturity under the climatic conditions of the season and region. For this purpose small but representative samples are taken from the vineyard regularly during the ripening period. The vineyardist carefully observes the increase in sugar and the decreases in acidity that occur during ripening in order to start harvesting at the most favorable balance of the two. The traditional vintage *bans* (fixing the day for vintage to begin) of Europe were a sort of collective control to ensure harvesting at the proper stage of maturation.

One limiting factor on how long the grapes can be left on the vines is the possibility that the grapes may rot after fall rains when the humidity rises. Also, in some cases the leaves will fall off, and no further increases in sugar can be expected. When the proper time for the vintage is reached, the grapes are harvested by cutting them from the vines with shears or with knives, placing them in baskets or boxes, and transporting these to the winery.

Fermentation.—It is necessary to crush the grapes in order to release the juice from the pulpy material. This is done by roller crushers or, more commonly now, by rotary paddle crushers. The crushed grapes are then pumped to the fermenting room, if red wines are to be made, or to juice separators or presses if white wines are to be made. Ordinarily, white grapes are used to produce white wines, but most red grapes can be used to produce white wines if the juice is rapidly separated from the skins.

Red Table Wines.—The production of red table wines involves placing the grapes in an open fermenting tank, adding about 75 parts per million of sulphur dioxide, a mild antiseptic, and after the antiseptic has had a chance to work, adding a small inoculum of a culture of pure yeast. The purpose of the antiseptic is to kill or inhibit wild alcohol-intolerant yeasts, primarily *Kloeckera* species, *Pichia* species, and *Hansenula* species. The purpose of adding an active culture of pure yeasts is to provide an inoculum of alcohol-tolerant yeasts. The primary yeasts responsible for alcoholic fermentation are varieties

TULANE/PHOTO RESEARCHERS

Quality control of good wines requires the services of wine tasters with acute senses of taste and smell.

of *Saccharomyces cerevisiae* var. *ellipsoideus*, often called the true wine yeast.

During fermentation the sugars of the grapes are converted to alcohol and carbon dioxide. Heat and several byproducts are also produced. In many regions the grapes are in such good condition and contain such an adequate microflora of their own yeasts that neither antiseptics nor yeast cultures are required. However, the variety of yeast has only a minor effect on the specific quality of the wine. The variety of grape is the primary factor controlling the overall quality of wines. Fermentation begins almost at once after the yeasts are added.

The flavor and coloring materials are located in the skins, and as the alcohol is produced from the fermentation of sugar, the flavors and colors are extracted from the skins. The fermentations on the skins last from three days to as much as two weeks, depending on how much tannin it is desired to extract from the skins. Wines that are intended for long aging generally are fermented on the skins longer than those that are expected to reach maturity earlier. During fermentation the floating layer of skins (called the cap) must be pressed down into the fermenting juice once or twice daily. Alternately, the juice may be pumped out of the bottom of the tank and sprayed on the cap. In warm weather sufficient heat may be retained to cause the temperature to rise so high as to inhibit yeast growth; cooling is necessary in such cases. After the desired amount of color and tannin has been extracted, the solid material (skins and seeds) is separated from the partially fermented juice in a press. Both basket-type and continuous-screw-type presses are used for this purpose, the former giving the best results.

White Table Wines and Rosés.—In the production of white table wines, the crushed grapes are immediately separated from their skins by placing them in a juice extractor, by draining off the juice in a settling tank, by pressing, or by combinations of these. Both hydraulically operated basket presses and cylindrical presses are used for this purpose; continuous presses are not suitable for unfermented crushed grapes. The unfermented juice is often settled by putting it in a cool place with about 100 parts per million of sulphur dioxide for 12 to 24 hours. This settling process allows the solid material (pieces of skins and seeds) which has pressed through the juice extractor or press to settle out, and the clear supernatant liquid is then decanted off for use in the actual wine-making process. This settling process produces lighter-colored and earlier-maturing wines. The juice, settled or not settled, must be inoculated with a pure yeast culture in most cases; about 1 to 3 percent of an actively fermenting pure yeast culture is usually used. The white wines are best fermented at relatively low temperatures, where they retain more of their fresh fruity flavor, temperatures of 50° to 60° F. being recommended.

In most cases, it is desired to ferment out all of the sugar in the production of white table wines. However, in a few cases white table wines with residual sugar are desired. This is particularly true in regions where the grapes have attained a high degree of sugar owing to attack of the mold *Botrytis cinerea*; for example, the Sauternes region of France. In these cases, the fermentations must be conducted at low temperatures in order to control the rate of fermentation. When the fermentations reach the desired sugar percentage, the wine is racked off the yeast sediment and cooled to about 50° F. or lower, and sulphur dioxide is used to reduce further the rate of fermentation. Filtration may also be employed to separate the yeast from the wine and thus stop fermentation. Recently fermentation under pressure has been used to control the rate and extent of fermentation.

An intermediate type of wine between white and red table wines are the pinks, or rosés. These are produced either by fermenting varieties of grapes with a small amount of color in the skins, as for red table wines, or by using normally colored varieties and separating the juice from the skins within 12 to 36 hours after the beginning of fermentation.

Fortified Wines.—Another type of wine, particularly popular in the United States, is fortified wine. These are wines to which alcohol is

added during or after the fermentation. The source of the alcohol is high-proof spirits obtained from the distillation of wines. The purpose of the addition of the alcohol is to stop the fermentation. Whether added during or after fermentation, the alcohol is raised to about 18 to 20 percent. Wine types such as port and muscatel are produced by fortifying during the fermentation; they retain 10 to 15 percent sugar. Dry fortified wines such as dry sherry and dry madeira are produced by adding the alcohol after the fermentation.

Vermouth.—Another type of dessert wine is vermouth. Two types of vermouth are produced at the present time: dry vermouth (French type), which uses a dry fortified white-wine base, and sweet vermouth (Italian type), which uses a sweet fortified white-wine base to which caramel syrup is added for coloring. Cane sugar is sometimes added for sweetening. In either case, mixtures of herbs or herb extracts are added to the wine base to impart the requisite herbal character. More than 60 different herbs have been used for vermouth production; among these are angelica root, anise seeds, bitter orange peel, cinchona bark, cloves, coriander seed, gentian root, quassia wood, Roman and common wormwood, and vanilla beans.

Sparkling Wines.—Sparkling wines contain an excess amount of carbon dioxide. The most popular types are champagne and other white sparkling wines, although some pink and red sparkling wines are also produced. The basic material for producing sparkling wines is a fruity, very clean-smelling white, pink, or red table wine of about 11 to 12 percent alcohol. To this basic material (called the *cuvée*) sugar and yeast, in carefully controlled amounts, are added. The mixture is then placed in a closed container for the secondary fermentation, which produces carbon dioxide and alcohol. Since the wine is in a closed container, it acquires a pressure of carbon dioxide gas.

Two general types of closed containers are used. The traditional method is to ferment in the bottles. Special bottles are used, which will not burst under the pressure; the cork is also held in with a special metal clamp. After the fermentation is completed, the bottles will contain about six atmospheres of pressure. In order to acquire the maximum quality, the wine is aged on the yeast for one to three years. When the wine is ready to market, it is necessary to remove the yeast deposit from the bottles with a minimum loss of pressure. This is done by turning the bottles on end and allowing the yeast sediment to drop onto the corks. The pressure in the bottles is then reduced as much as possible by lowering the temperature to about 25° F. and freezing the neck of the bottle. The yeast deposit is disgorged by carefully removing the cork and allowing the frozen plug of yeast and wine to be forced out. More wine and a small amount of brandy-sugar solution is added to fill the bottle, and a new cork is quickly inserted. Bottle-fermented sparkling wines are sometimes disgorged into tanks and the wine filtered into the bottle.

The other and more modern process is to ferment the wine in a closed tank—usually with capacity of 500 to 1,000 gallons and made of stainless steel. After the fermentation is completed, the requisite brandy-sugar solution is added, and the whole mixture is passed through

COURTESY OF THE WINE INSTITUTE

In many wineries traditional huge wooden vats are still used for fermentation of the crushed grapes.

a filter into the bottles. This is obviously much the cheaper of the two processes, but since the wine does not remain on the yeast deposit as long, it is not supposed to produce quite as good a quality of wine.

Processing—Racking.—After fermentation, the wines are cloudy from suspended material, mainly yeast, and contain an excess amount of carbon dioxide. Much of the suspended yeast precipitates out naturally when the wine is stored. The supernatant clear wine is then removed from the deposit (this is called racking) and transferred to a new container. During the process of racking a considerable amount of the excess carbon dioxide will also be lost. The clarification proceeds very rapidly during the period immediately after the completion of the fermentation, especially in small containers. The new wine is very subject to oxidation, and in order to prevent contact with oxygen in the air, the wine must be kept in full containers. Since the temperature gradually drops following fermentation, an air space will develop as a result of the contraction of the liquid in the containers. It is therefore necessary to fill the containers frequently (called topping), usually about once a week for the first few months. This is more important for table wines, especially whites, than for fortified wines.

Filtration and Fining.—While racking is the primary method of clarification, other measures are needed to get the wine into the brilliant condition which is necessary for bottling. Filtration is the most common procedure used for this purpose at the present time. Pad filters are usually used, the pads being made of asbestos fiber, in a variety of porosities. Filtration may be done roughly, to remove large amounts of suspended material, or very finely to remove the smaller

particles. Asbestos pads capable of removing microorganisms are available, and in some cases, particularly in Germany, where it is desired to bottle slightly sweet low-alcohol wines, a germ-proof filtration into the bottle is made so that no yeast cells will be present.

A very ancient process used for clarification is the addition of an organic or inorganic material which, as it settles in the container, physically or by absorption tends to remove the suspended material. This process is called fining. The common fining agents used at the present time are gelatin, isinglass, and bentonite. Bentonite is a clay material with tremendous swelling properties and is most commonly used for clarification of wines in the United States. Another method of clarification is centrifugation. This is occasionally used for grape juice in Germany, but is seldom employed by wineries in the United States.

Other Processes.—The new wines are also supersaturated with potassium acid tartrate (cream of tartar). Since this salt is less soluble at lower temperatures, one of the methods of removing the excess cream of tartar is to lower the temperature. This is one reason why storage in cool places is recommended for wines. If, however, the winery is situated in a warm region and the wine is stored in very large containers, the temperature will not be reduced sufficiently to precipitate the requisite amount of cream of tartar. In these cases, it is necessary to chill the wines in order to remove it. An alternative process is to pass the wine through a cation exchanger in which the potassium is exchanged for sodium. It is not necessary to do this for all of the wine, only for enough wine to reduce the potassium content of the blend sufficiently so that potassium acid tartrate will not precipitate. Sodium acid tartrate is very soluble.

Pasteurization was originally devised by Louis Pasteur to kill harmful bacteria in wines. However, with the use of sulphur dioxide and pure yeast cultures, it is very rare today for bacteria to develop in wines sufficiently to cause spoilage. Pasteurization is therefore seldom used in wineries to kill bacteria. Short-time, high-temperature heating is occasionally used to deactivate certain oxidizing enzymes which cause browning of wines. Longtime heating is used in Madeira and California for the production of wines of the Madeira and California sherry types. These wines are usually heated for three to four months at temperatures of 120° to 140° F. A slight caramelization and considerable oxidation occur during this process, which gives the wines their particular character.

Aging.—White table wines are aged in the wood for only very short periods of time, usually 6 to 12 months, before they are sufficiently bright to be bottled. In fact, dry white table wines retain more of their desirable fresh fruity flavor by being bottled when they are rather young. Sweet table wines may require a longer period of aging before they are sufficiently stable for bottling. Red table wines definitely require a longer period of aging in order to lose a sufficient amount of tannin and to attain the degree of oxidation desired; usually the aging of red table wines is continued for two to four years. Dessert wines, for economic reasons, are frequently kept in the wood for very short periods of time. However, they should be aged for a longer time in order to attain their best quality.

Wines are polish-filtered just before they are bottled. This involves filtering through a pad filter whose pores are very small. The bottles may have the traditional cork inserted, but in many cases screw caps are used in the United States.

Wines continue to age in the bottle. White wines will usually reach their maximum quality within six months to about two years after being bottled. Red wines, particularly those of higher tannin content, may continue to improve in quality for 10 to 15 years after bottling. Dessert wines, however, change very slowly after they are bottled, and some port ages very well in the bottle.

MAYNARD A. AMERINE,
Professor of Enology, University of California.

4. History

The present types of wine grapes are descended from older species indigenous to the mountains in Armenia, south of the Caucasus. Archaeological data indicate that viticulture probably began there and penetrated to Mesopotamia and Egypt well before 3000 B.C. Hence, the custom of drinking wine is at least 5,000 years old, and with viticulture it spread from the ancient Near East to Europe and the Far East.

The river valleys of Mesopotamia were unsuitable for viticulture and the production of wine and raisins. Wine, although a favorite drink with the rich, always remained an expensive commodity imported from the highlands, which seldom were dominated by the kings or city-states of Sumer, Assyria, or Babylonia. The popular drink of these countries was beer. Wine was also obtained from Helbon, near Damascus, whose wines are mentioned by the prophet Ezekiel (Ezekiel 27:18).

Egypt.—In ancient Egypt, wine was much more popular. Viticulture had been introduced in predynastic times, and we find in tombs even of the 1st dynasty (c. 3000 B.C.) that the body is lying on a layer of grapes, which would accompany the dead on his journey. The vineyards gradually spread south from the Nile delta and the suburbs of Memphis, the capital, and also to the oases of the western desert such as the Faiyum. The grapes from orchards and gardens were properly pressed by treading and fermented in cellars. Tax inspectors checked the quality of the wines, and inscriptions on the clay stoppers of the pottery jars give the details of the vintage, such as the name of the vineyard, date of the harvest and pressing, name of the vintner, and brand.

Scores of brands were known, and the Egyptians tried to improve them by importing new vines from Palestine and Syria. Still, the classical authors did not think much of Egyptian wines. In Syria and Palestine viticulture was second only to the cultivation of olives and figs, and their wines were better. In all these countries, wine was always diluted with water, a long-standing custom in Mediterranean regions, where pure potable water is not very common.

Greece.—The vine came to the Aegean Sea region long before the fall of Troy (c. 1184 B.C.). The natural curiosity of the Greeks led them to apply their latest botanical discoveries to viticulture. Aristotle's famous pupil, Theophrastus (d. about 287 B.C.), gives excellent instructions

winegrowers, and by his time many Greek districts were specializing in the production of port wines to be exchanged abroad in the Black Sea or the western Mediterranean for foodstuffs and goods. With the jars of wine went the drinking habits and all the vessels needed for carrying, storing, mixing, and drinking wines, which strongly affected Celtic art.

The Greeks also invented the beam press, a better way of producing grape juice than treading, and they coated their porous amphorae (ars) with resin, giving their wines the peculiar taste still proper to the modern Greek *retzinato*. They also introduced methods of combating the acidity of wine and concocted medicines by mixing or extracting herbs and fruit with wine. Wine also played its part in sauces, unguents, and cosmetics and as a general solvent. Greeks and Romans never drank pure wine. At their symposia the master of ceremonies indicated the percentage of water to be added.

The one-sided economy of the Greek homeland, founded on exports of quality wines to distant Greek bases, showed its weakness when regions such as southern Russia and Gaul began to grow their own wines and compete with those of Greece, spurring the mother country to improve its wines or suffer, as it did after the Roman domination began in 146 B.C.

Rome.—The Romans, too, were great wine lovers. Viticulture always formed part of the routine of their larger estates. Here again, the homeland suffered by specializing in viticulture, which necessitated importing cereals. The 150-mile Monte Testaccio in Rome, consisting of broken wine jars, testifies to the enormous quantities of cheap Spanish wine imported for the Roman plebs. Unenforceable edicts, such as that of Emperor Domitian in 92 A.D. to cut down the Spanish and Gaulish vineyards, could not stem the decline of Italian viticulture. In the early centuries of the Christian era, the Bordeaux region and the Rhône and Moselle valleys became centers of viticulture. Vines even appeared in the Roman villas of southern Britain. The Romans introduced many improvements, such as the screw press and cork stoppers (which allowed wines to be kept longer than the older straw or clay plugs), and from the Celtic tribes of the western Alps they adopted wooden tuns and vats to store and transport wines.

Medieval and Early Modern Europe.—The fall of the Roman Empire and the incursions of German and Asiatic tribes, Muslim armies, and Norse vikings caused the vine to disappear from England, northern France, Swabia, and eastern avaria. Medieval viticulture was a slow rediscovery of classical techniques, assisted by Christianity (as every parish sought to produce the wine needed for the church ritual) and by the fact that the Romanization of the beer-loving Celts had changed Spain, France, and parts of Germany into wine-drinking countries. The Near East, meanwhile, was lost to viticulture by the rise of Islam, though some peoples like the Persians still grew grapes and wrote beautiful verses on the virtues of wine.

In the West, the shipments of Bordeaux wines were few from the 5th to the 9th centuries, at which time Henry Plantagenet, later King Henry II of England, married Eleanor of Aquitaine (1152) and large consignments of Gascon "claret" flowed yearly to English ports. When King Edward III (r. 1327-1377) cut down the outflow

of English coin, part of the Bordeaux wine exports was taken over by Flemish and Dutch merchants, who traded salt and wine for timber and wheat with the countries adjoining the Baltic. By the 14th century, the sale of claret in western Europe had declined somewhat in favor of sweet wines from Portugal, Spain, and the Mediterranean. By that time viticulture was firmly reestablished along the Rhine and in Swabia, Franconia, and Thuringia, even crossing the Elbe into the Oder district. Rhenish and other hocks began to compete with clarets.

Handbooks on viticulture began to appear in the 13th century, when Arnaud de Villeneuve (1235?-1312) and Pietro Crescenzi (1230?-1310) wrote their books, which also dealt with "medical wines" and other pharmaceutical concoctions in which wine played the part of a solvent. During the Middle Ages, such wines as hippocras were often drunk as table wines. The series of epidemics called the Black Death (1348-1350) introduced the use of strong distilled alcohol as a solvent in such medicines, and after the epidemics were over the taste for strong spirits and liqueurs, originally conceived as cures for pestilence and disease, remained and set back the consumption of wine.

The 16th century saw the rise of "canary sack," a fortified wine of the sherry type made in the Azores and Madeira and celebrated by Shakespeare and Ben Jonson. In the 17th century came the introduction of sparkling champagne wine. The technique of its manufacture, discovered about 1668, was perfected by Dom Pierre Pérignon, who in 1670 became cellarer of the Benedictine abbey of Hautvillers. The 17th century also brought the rise of port wines. The Methuen Treaty of 1703 between England and Portugal, which reduced English duties on Portuguese wines one third below those paid on French wines, was a great stimulus to the consumption of port in England and northwestern Europe. The exports of French wine declined and did not recover until the middle of the 19th century.

Modern Era.—By the 19th century, viticulture had been established in North Africa and in the Cape Colony (South Africa), which began exporting "Constantia wines" from the vineyard of Groot Constantia, south of Cape Town, about 1800. Australian wines began to be exported about 1850. Wine growing was introduced into Argentina, Brazil, Peru, and Chile, but the product was largely for home consumption. Viticulture was established also in California (see following section *United States*) and by 1840 in Ontario. Spanish viticulture rose rapidly after 1840, and Burgundy wines were more widely appreciated by 1850. The wine trade was profoundly affected by the introduction of duties on alcoholic strength rather than on volume, and by the licensing system, such as that introduced in Great Britain by William E. Gladstone about 1860, which also imposed a high tax based on strength and thus worked to bring beer and imported French wines (especially light table wines) back into favor. Modern appreciation of vintage wines and customs of combining certain wines with special dishes developed in Victorian days.

R. J. FORBES,
Professor of the History of Pure and Applied
Sciences in Antiquity, Faculty of Letters and
Philosophy, University of Amsterdam.

United States. The history of wine in the United States began when Leif Ericson landed on American soil, 500 years before Columbus was credited with its discovery. Ericson called the land *Vineland the Good* because of the profusion of grape vines he found here. Grapes were a staple food of the Indians, but there is no evidence that any Indian tribe collected the fruit or made wine. Capt. John Smith and other early colonists made small amounts of wine from wild grapes, but the product was thin and unpalatable.

East. From the 17th to the 19th century there were many attempts to acclimate the European grape, *V. vinifera*, to the eastern United States. Italian, French, and German vineyardists, winemakers, and vines were brought to various colonies in an effort to develop an American wine industry with the European grape, but none of these was permanently successful, and some of them were spectacular failures. Colonial America got most of its wine from Europe—Madeira was particularly popular. The failure of *V. vinifera* to develop in the eastern United States was due to unfavorable climatic conditions.

By the end of the 18th century, attention turned to the domestication of the native species, of which there were many: *V. riparia*, *V. labrusca*, *V. rotundifolia*, and others. The first domesticated native grape, the *V. labrusca*, was planted during the American Revolution by John Alexander. By 1801 the Alexander grape was flourishing in Indiana, beginning a wine industry there that prospered for many years.

The first commercially successful wine growing in the United States was established in York, Pa., by Thomas Eichelberger in 1818. That same year a Baptist deacon, Elijah Fay, began the first vineyard in the Chautauqua Grape Belt in New York, but it was not until 1830, after he replaced his wild grapes from New England with native Isabella and Catawba, that he produced his first ten gallons of wine.

The introduction of the Concord in 1852 led to its gradual spread throughout the eastern part of the United States, and by the time of the Civil War a number of promising native varieties were widely planted. These included the Alexander, Catawba, Concord, Isabella, Clinton, Herbemont, Norton, and Delaware. The wine produced from these native grapes had a "foxy" or "grape jelly" taste that modern methods have lightened or eliminated.

The first American champagne was made by Nicholas Longworth in Cincinnati in 1842. Although wines were made by small wineries in the East prior to 1850, the large-scale Eastern wine industry developed after that date, in the Chautauqua and Finger Lakes districts of New York and in the Carolinas, Missouri, Virginia, Pennsylvania, Michigan, Indiana, Illinois, New Jersey, Arkansas, and Ohio. In 1876, American wines won two awards at the Paris Exposition, and in 1900 they won three dozen medals for their excellence.

The most important Eastern wine industry is now in New York, with smaller plants producing in Ohio, Michigan, and elsewhere. While the number of wineries east of the Rocky Mountains is small, a number of these wineries are very modern in respect to the equipment installed and the processes employed.

Because they use native varieties of grapes or their hybrids, Eastern wines bear a family

relationship to one another and have a distinct aroma, owing to the presence of methyl anthranilate. (A few Eastern wines, made from *V. vinifera* or *V. rotundifolia*, do not have this aroma.) Both still and sparkling wines are produced. Considerable vermouth is also produced in the eastern United States, some blended with more or less California wine. (Wines labeled simply "American" usually have some California wine blended in.)

California. The California wine industry has a completely separate origin from that of the Atlantic seaboard. The Spanish priests in Mexico planted cuttings or seeds of some European varieties of *V. vinifera* in the 16th or 17th century, and from these was developed the Mission variety. Mission wines for sacramental purposes are known to have been made in California as early as 1609. In 1833, Jean Louis Vignes imported *V. vinifera* from France. The plants thrived in the warm California climate, and several varieties of this species were established.

After the establishment of the first mission in California proper in 1769, the Mission variety was planted rather widely there, and it is still grown. Wine was made at several of the California missions, as well as in a few vineyards in southern California prior to the Gold Rush of 1849. This wine often was fortified with brandy because the warm climate of southern California led to spoilage of the low-acid table wines. Some brandy made was also from the Mission and other varieties.

After the Gold Rush, the industry flourished to such an extent that San Francisco vintners began exporting their wine made from European vines, to England, Germany, Russia, China, and Australia. When the first transcontinental railroad was completed in 1869, California wines came to the midwestern and eastern markets, and the state became the leading wine producer in America.

After 1850, grape plantings were made throughout the state, and much of the California wine industry gradually moved to the northern part. It increased in size up to prohibition. The importation of numerous varieties from Europe by Agoston Haraszthy in 1862, the work of Eugene Woldemar Hilgard at the University of California on grape varieties between 1880 and 1892, and the development of the huge California Wine Association toward the end of the 19th century may be cited as landmarks of this period. Many California brands of wines were well known on Eastern markets at the time of prohibition. There was even a small export trade to Great Britain.

When prohibition began to stalk the country in 1880, the wine industry was struck a lethal blow. Kansas was the first state to go dry. By World War I, 33 of the 48 states had adopted prohibition laws. With the onset of national prohibition in 1920, winemaking in America virtually died, and it had to be reborn when the federal law was repealed in 1933. However, the industry's real awakening came after World War II when a steady rise in the consumption of table wine began in America. The industry that has flourished in Europe for centuries is but a few decades old in America.

Following repeal, over 700 commercial wineries were established in California, but many were merely home wineries, and they soon disappeared. Some of these California wineries are

among the most modern and efficiently operated wineries in the world; stainless steel and automation, for example, are used on a scale not equaled elsewhere. The most important wine-producing districts in California are in southern California, in the San Joaquin Valley, and in the coastal valleys of Sonoma, Napa, Alameda, and Santa Clara counties. A nonprofit organization, the Wine Institute, was organized in 1935 and has been active in stabilizing the industry.

All types of wines are produced: still and sparkling, table and dessert, and flavored. Since only *V. vinifera* varieties are used, California wines resemble European wines in flavor more than they do the wines made of native varieties in the eastern United States. The better California table wines are now labeled with the name of the variety from which they are produced.

In the last decade wine consumption in the United States has more than doubled. Nine out of every ten bottles of wine sold in America are made in America. The California wines made from the *Vinifera* brought here from France more closely resemble European wines, but even they are uniquely American. The *varietals* of the East are made mainly from native grapes, particularly Labrusca, Concord, and Catawba. The most exciting developments in modern wine-making are the experiments that are being conducted with French-American hybrids that could revolutionize the comparatively young wine industry in this country.

WINEBERRY, win'bēr-ē, the colloquial name of arious plants, especially *Rubus phoenicolastus*. *phoenicolastus*, in the rose family, Rosaceae, a bush with arching, somewhat spiny stems which are covered with purplish red glandular hairs. The canes root at the tips. The three-plate toothed leaves are densely white-hairy on lower surface. The panicked flowers have all white petals and a conspicuous bristly lyx which encloses the developing fruits. At aturity the fruits are red and about one half

inch in diameter. The wineberry is a native of eastern Asia. It was introduced as an ornamental plant because of its graceful stems and whitened leaves, and has escaped from cultivation. It is closely related to the cultivated raspberries. Various other plants are or have been called wineberry, including the red currant, *Ribes sativum*; the gooseberry, *Ribes Grossularia*; the mountain cranberry, *Vaccinium Vitis-Idaea*; the bilberry or whortleberry, *Vaccinium Myrtillus*; the grape, *Vitis vinifera*; the partially poisonous tutu, *Coriaria ruscifolia*, a shrub of New Zealand; and the makomako, *Aristolelia racemosa*, a tree native of New Zealand.

EDWIN B. MATZKE
 Former Professor of Botany
 Columbia University

WINEBRENNER, win'bren-ər, John (1797–1860), American religious leader. He was born near Walkersville, Md., on March 25, 1797, and was ordained in the German Reformed Church in 1820. In 1830, in Harrisburg, Pa., he established the Church of God, whose members regarded the Bible as the only rule of faith and practice. The denomination later became the Churches of God in North America. Winebrenner died in Harrisburg on Sept. 12, 1860.

WINESBURG, OHIO, winz'búrg ō-hŭō, a series of 23 short stories by Sherwood Anderson (q.v.), published in 1919. In a preliminary sketch the author explains his controlling point of view toward the chief characters in the stories: "It was the truths that made the people grotesques. The moment one of the people took one of the truths to himself, called it a truth, and tried to live his life by it, he became grotesque and the truth he embraced became a falsehood." Described in psychological rather than philosophical terms, Anderson's "grotesques" represent people who have been forced out of the focus of normality by oddities, repressions, or frustrations which, in time, take control and find overt expression through eccentric, explosive, and tragic acts.

Hands, for example, the first story of the group, tells of Wing Biddlebaum, a gifted teacher, whose innocent passion for touching and caressing everything and everybody is misinterpreted, costing him his rightful vocation in life. *Queer* is the story of Elmer Cowley, rendered queer by his obsession with the idea that he is thought queer by others. *Death* presents the essentials of a hysterically intense, repressed, yet significant emotional relationship between one of Winesburg's doctors, his patient, Elizabeth Willard, a tired, gaunt old woman at forty-one," and her son George. Through her death, the son achieves a sudden, intuitive understanding of his mother's warped life. Sherwood Anderson's abrupt, intense, non-realistic technique is peculiarly effective in these stories, which resemble dream states.

WINFIELD, win'fēld, city, Kansas, seat of Cowley County, on the Walnut River, 39 miles by road southeast of Wichita. It is a trade and shipping center in an area where cattle, hogs, and poultry are raised, and wheat, alfalfa, and corn are grown. There are also oil wells in the vicinity. Establishments in the city process dairy, poultry, and meat products, prepare stock feeds, mill flour, and manufacture gas burners, barrels, water cans, oilfield equipment, and steel products.

There is an airport. Southwestern College, a coeducational Methodist institution, and St. John's, a Lutheran junior college, are situated here. Special emphasis is laid on music in the colleges and public schools. At the northeast edge of the city is the Winfield State Hospital and Training Center for subnormal persons. Winfield was incorporated as a third-class city in 1873 and a second-class city in 1879. The commission-manager form of government was adopted in 1923. Population: 11,931.

WINGATE, wīn'gīt, **Orde Charles**, British army officer: b. Naini Tal, India, Feb. 26, 1903; d. Assam, March 24, 1944. Son of a British officer in India, he was educated at the Royal Military Academy, Woolwich, and commissioned in the Royal Artillery in 1923. He subsequently studied Arabic, served in the Sudan, and then in Palestine (1936-1939), where he was decorated for organizing night patrols which helped to protect Jewish settlements from Arab attacks. In 1941, while a temporary lieutenant colonel, he slipped into Ethiopia with Emperor Haile Selassie. Together the two of them organized a force of under 2,000 men that killed or captured large numbers of Italians. They succeeded in restoring the Emperor Haile Selassie to the throne in less than four months.

In 1942 Wingate was sent to India, where he formulated a plan for the reconquest of Burma by operating behind Japanese lines. Promoted brigadier, he trained a force of Gurkhas, British, and Burmese in rigorous jungle warfare and led them on a sustained raid (February-May 1943) across the Chindwin River, wrecking Japanese communications. His own supplies came wholly by air. In March 1944, as major general, he took a larger force by air 200 miles (320 kilometers) behind Japanese lines in Burma, but Wingate was killed in a plane crash a short while after the operation began. He was one of the most successful leaders of this type of warfare in World War II.

WINGED LION, wīngd lī'ən, the symbol of the evangelist St. Mark, which was adopted as the heraldic device of the Venetian Republic. A celebrated bronze figure of the winged lion of St. Mark surmounting a magnificent red granite column, formed out of a single block, stands in the Piazzetta of St. Mark at Venice.

WINGED VICTORY OF SAMOTHRACE, wīngd vīk'tər-ē, sām'ō-thrās, a statue of the Greek goddess Nike (q.v.), discovered in more than 300 fragments on the island of Samothrace, Greece, in 1863, but restored in 1875 and now in the Louvre Museum, Paris. A fingerless right hand and one finger, apparently belonging to the statue and found on the island in 1950, were presented to the Louvre in 1955. The sculptor was an unknown Rhodian, who carved the *Victory* in heroic size, from marble, about 200 B.C. Standing on a pedestal shaped like a ship's prow, the statue is headless and armless; its wide-spread wings appear to quiver. The body leans

Photo Bulloz

The Winged Victory of Samothrace.

slightly forward, as if breasting a sea breeze, which presses the dress over swelling bosom and curved hips. Judging from numismatic representations of other figures of Nike, some scholars suppose that the right hand held a horn to sound the battle signal and the left hand carried a wreath or a small flagstaff. In dignity of conception and in masterly treatment of wind-swept drapery, the *Victory* is probably the finest extant example of early Hellenistic art. The older view that the statue commemorates the naval victory of King Demetrius I Poliorcetes of Macedon over Ptolemy I Soter of Egypt off Salamis, Cyprus, in 306 B.C., is no longer held valid.

Formerly Princeton University

WINGHAM, wīng'am, town, Ontario, Canada, in Huron County, about 110 miles west of Toronto at the confluence of the Maitland and Middle Maitland rivers, which furnished power for its early industries.

Served by Canadian National and Canadian Pacific railways, it is a shipping center for grain and livestock, and a service and educational center for the surrounding general farming area. Industries include gristmills, sawmills, and furniture and woodworking plants. The area was settled in the 1830's, and the town was incorporated in 1879. Population: 2,897.

D. F. PUTNAM
University of Toronto

WINGS OF THE DOVE, *The*, a novel by Henry James (q.v.), published in 1902. The central idea, which James said later he had had long in mind, is "that of a young person conscious of a

great capacity for life, but early stricken; . . . aware . . . of the condemnation and passionately desiring to 'put in' before extinction as many of the finer vibrations as possible, and so achieve, however briefly and brokenly, the sense of having lived." The "young person" of the novel is Milly Theale, an American heiress doomed to die of some obscure malady. Her friend, Kate Croy, is engaged to Merton Densher, a poor journalist, but conceals the engagement from her aunt, Mrs. Lowder, her only hope of wealth. Milly is attracted to Densher, and Kate suggests that he marry Milly to secure a fortune on which they can marry after Milly's death. The scheme, partly carried out, ends in frustration and defeat for all concerned. The novel stands with *The Ambassadors* (1903) and *The Golden Bowl* (1904) at the summit of James' final method of subtle and detailed analysis of character. It is not a book for hasty readers.

WINKELRIED, ving'kæl-rēt, Arnold, Swiss hero, who died on July 9, 1386, at the Battle of Sempach. At Sempach the Swiss in wedge formation attacked a tight line of numerically superior Austrian knights, who were heavily armored. Unable to gain headway, the attackers were in danger of being enveloped by the enemy flanks. It is said that by renewing the charge on his own, Winkelried drew so many pikes to himself that he opened a gap in the battle line, enabling the Swiss to break through and defeat the less mobile Austrians.

WINKLER, wingk'lər, a town in Manitoba, Canada, about 70 miles (113 km) southwest of Winnipeg and 12 miles (19 km) north of the U.S. border. It is an agricultural and manufacturing center. Farm products from the surrounding area are processed there. Other products include machinery, metal, and plastics. The original settlers were Mennonite immigrants, and Mennonites still predominate in the town. Winkler was incorporated as a village in 1906 and as a town in 1954. Population: 5,926.

WINNEBAGO, Lake, win-ə-bā'gō, a lake in Wisconsin, the largest in the state, situated 55 miles (89 km) north-northwest of Milwaukee, in Calumet, Fond du Lac, and Winnebago counties. It lies about 750 feet (229 meters) above sea level, is about 30 miles (48 km) long and up to 10 miles (16 km) wide, and has an area of 215 square miles (556 sq km). The Fox River enters the lake at Oshkosh, on the western shore, and flows out at the lake's northwestern corner. With the Fox, which empties into Lake Michigan's Green Bay, and the Portage Canal connection to the Wisconsin River near the Fox's source, Lake Winnebago is part of a continuous waterway between the Great Lakes and Mississippi River. The lake contains an abundance of fish. On the eastern shore is a curious wall of stones pressed against the shore by ice expansion. The city of Fond du Lac is at the lake's southern end.

WINNEBAGO INDIANS, win-ə-bā'gō, an important North American Indian tribe of the Siouan linguistic family, closely related to the Oto, Iowa, and Missouri. Their name derives from the Sauk-Fox word *winipyagohagi*, meaning "people of the stinking water." In early records they are often called the Stinkard Indians, from the translation of their name.

Their traditional homeland is the Green Bay area of Wisconsin. They moved back and forth across the state, and between 1825 and 1856 ceded their lands, piece by piece, in return for reservation status. They suffered greatly from forced removal and epidemics, and their estimated population of 5,000 in early times had dwindled to fewer than 1,500 by the time they finally were settled with the Omaha in Nebraska in 1863. The fact that the Winnebago were so widely scattered has made a census extremely difficult.

The Winnebago first were friendly with the French but slowly transferred their allegiance to the British. They fought against the Americans until the close of the Black Hawk War (1832) but thereafter remained peaceable.

The culture of the Winnebago is much the same as that of their Great Lakes Algonkian neighbors but is interesting because it represents a Siouan enclave in the midst of Algonkian peoples. Their religious beliefs are almost identical with those of the Dakota people, but their arts are those of forest folk. Although they have many ceremonies more closely reminiscent of the Dakota tribes, they have incorporated many features of the great Midéwiwin (Grand Medicine Society) healing rites of the Great Lakes Indians. They call themselves Hochangara, meaning "people of the real speech," which is an interesting allusion to their origin, for it supports the tradition that they were one of the mother tribes of the Siouan stock.

FREDERICK J. DOCKSTADER

Author of "Great North American Indians"

WINNER, win'ər, Septimus, American song writer: b. Philadelphia, Pa., May 11, 1827; d. there, Nov. 22, 1902. After learning as a youth to play the violin, he ran a music store in Philadelphia. His first successful song was *How Sweet Are the Roses* (1850), published under the pseudonym of Alice Hawthorne, as were many of his later compositions. Some of his earlier songs were known as Hawthorne Ballads. His most popular song was *Listen to the Mocking Bird* (1854), which he is said to have sold for \$5; 20 million copies were bought in the next 50 years. Another of his compositions was *Where, Oh Where, Is My Little Dog Gone?* (1864).

In 1862, Winner wrote *Give Us Back Our Old Commander: Little Mac, the People's Pride*, expressing popular sentiment in favor of reinstating Maj. Gen. George B. McClellan as Union commander. The federal authorities thought the song subversive and arrested Winner. He was released after promising to halt its sale.

Winner was an outstanding popularizer of music in the United States. He published more than 200 books of music arrangements and instruction.

WINNETKA, wi-net'ka, a village in Cook county, Ill., on Lake Michigan, 18 miles (29 km) north of downtown Chicago, of which it is a residential suburb. The name is probably from a Potawatomi Indian word meaning "beautiful place." The site, on the old Green Bay Trail, was first settled in 1836. The village was incorporated in 1869. Its school system is noted for the development in 1919 of the Winnetka Plan emphasizing ungraded individual work in elementary school. The Hadley School for the Blind was founded in Winnetka in 1922. Population: 12,174.

Manitoba's Legislative Building, a Winnipeg landmark completed in 1929, was built in the Beaux-Arts style.

WINNIPEG, win'-ə-peg, the capital and largest city of the province of Manitoba. The city is in southern Manitoba, on the eastern edge of Canada's prairies, at the confluence of the Red and Assiniboine rivers. Winnipeg's location near the geographic center of Canada gave rise to the nickname "Bull's Eye of the Dominion"; its strategic location earned it the appellation "Gateway to the West"; and the city's economic functions in Canada as a whole—which were similar to those of Chicago in the United States—suggested the sobriquet "Chicago of the North." The name Winnipeg originated in the Indian name given to the lake 40 miles (64 km) north of the city—*winn*, meaning "muddy," and *nippe*, meaning "water."

A northern city with long, cold winters and short, hot summers, Winnipeg plays a critical role in Manitoba's economy. It contains over 60% of the province's population and an even higher proportion of its employees. It produces over 80% of its manufactured goods and accounts for over 60% of its retail sales. It is still preeminently a transportation center, but manufacturing and service industries are increasingly important. Winnipeg is a major cultural center of western Canada and has long held a reputation as the home of a thriving arts community. It is also a center for education and for sports.

Winnipeg is well known as an innovator in urban government. In 1972 the provincial government replaced more than a dozen municipal governments in the area with a single, 50-member

council to govern a metropolitan urban region of over a half million persons. The new creation was dubbed "Unicity." Its establishment was a notable event in North American urban development because for the first time an urban region had moved beyond two-tiered metropolitan government to a single, unified administration and council.

Growth of the City. The original street pattern took shape between incorporation in 1874 and the arrival of the transcontinental Canadian Pacific Railway in 1885. Streets followed the pattern of old river lots and fur-trade routes. The Canadian Pacific Railway played a critical role in Winnipeg's evolution. The company's tracks divided the city in two: an impoverished, ethnically heterogeneous North End and a prosperous, homogeneous Anglo-Saxon South End. By 1900 the corner of Portage Avenue and Main Street in the South End—reputed to be the windiest and the coldest corner of North America—had become the center of the city's commerce.

Like most other western North American cities, Winnipeg did not develop distinctive architectural styles for its major buildings; rather, the city's architects and builders imported styles from the cities of the east, anxious to overcome any suggestion of frontier status.

The city suffered from a disastrous flood of the Red River in 1950. A major rebuilding took place in the subsequent decade, a notable feature of which was the construction of the city's first major shopping center at Polo Park (1959).

Thereafter the pace of growth in Winnipeg was steady. The city possessed one of the most stable economies in Canada and neither enjoyed nor suffered from the dramatic growth cycles experienced by Toronto, Vancouver, and Calgary. Nonetheless, a building boom of major proportions occurred in the 1960's and 1970's. The urban landscape was altered by commercial, educational, recreational, and governmental building. New zones were created, and the character of old areas changed. New industrial parks were developed, large shopping complexes sprang up in the suburbs, and universities and colleges were expanded. In the center of the city, changes included the demolition in the 1960's of Winnipeg's famed 1886 city hall and the construction on the same Main Street site of a new city hall complex; the construction, across from city hall, of the Centennial Centre, which included a planetarium, concert hall, and provincial museum; and the erection of numerous high-rise structures that changed Winnipeg's skyline. This building activity was fueled by several unique public corporations, such as the North Portage Development Corporation. At the same time, the city council sought to increase recreational use of the city's only outstanding natural features—its two rivers. Bicycle paths, marinas, and parks are maintained throughout the urban area.

Cultural and Sports Resources. The city's acclaimed Royal Winnipeg Ballet and the Winnipeg Symphony Orchestra perform at the Centennial Centre, which is in the central city. Nearby are the well-known Manitoba Museum of Man and Nature, the Winnipeg Art Gallery, the Provincial Archives of Manitoba, the Manitoba Theatre Centre—one of the most important regional theaters in North America—and the Assiniboine

Park Zoo. The Royal Canadian Mint (one of only two in Canada, the other being in Ottawa) is on the outskirts of the city. Just north of the city is Lower Fort Garry, a historical restoration and national park. The Manitoba Music Festival and Folklorama, a festival of ethnic culture, both held annually, are among the largest such events in Canada.

Sports are popular in Winnipeg, especially football and curling. In both sports the city has excelled: the Winnipeg Blue Bombers, the city's Canadian Football League team, won its first Grey Cup championship in 1935 and has repeated this achievement many times since; Winnipeg curling rinks have taken the Brier prize with some frequency since Winnipeg's first win in 1947. Winnipeg's hockey team, the Jets, plays in the National Hockey League. Winnipeg was host to the 1967 Pan-American Games, which left the city a legacy of an Olympic-size swimming pool (home of the National Aquatic Hall of Fame), a cycling velodrome, a high school stadium, a track-and-field facility, and a rifle range.

Other Places of Interest. The provincial legislative buildings and the University of Winnipeg are downtown landmarks. To the east of the city center is the neighborhood of St. Boniface, which has one of the largest concentrations of French-Canadians in western Canada. Other major points of interest include the University of Manitoba, south of the city center; Red River Community College; and the Manitoba School for the Deaf. The Canadian Pacific Railway yards, located in the North End, are the largest privately owned yards in Canada.

In addition to several major and minor museums, Winnipeg has a historic area in the central city known as the Warehouse District, in which is found the continent's best collection of late

COURTESY ROYAL WINNIPEG BALLET

The Royal Winnipeg Ballet, founded in 1939, regularly performs classical and Romantic ballets, such as *Les Sylphides* (right). It is also known for its innovative modern repertoire.

19th and early 20th century warehouse buildings. Most have been renovated and contain offices, restaurants, retail outlets, and housing.

History. The first permanent settlement on the site of Winnipeg was established around a general store some distance from the future Hudson's Bay Company post of Upper Fort Garry, which was built on the bank of the Red River in 1821–1822. Winnipeg was incorporated as a city in 1874 even though it hardly resembled an urban settlement; it was at that time little more than a collection of motley buildings housing some 3,000 people.

The key event in Winnipeg's early history was the arrival of the Canadian Pacific Railway. Together with the city's key location on the edge of the western prairie, the arrival of the railroad made Winnipeg the strategic site for Canadian western expansion. For almost three decades following the completion of Canada's first transcontinental railway, Winnipeg enjoyed a level of growth and prosperity unequaled in the history of Canadian urban development. The railway opened the west to large-scale settlement and development, and Winnipeg's location made it the logical focus for both new transcontinental railways and the branch lines feeding them. Deliberate policy, in the form of tariffs that discouraged trade with the United States, ensured that the west would be dependent on commercial ties with Canada's eastern cities and that Winnipeg would be the key city in east-west trade.

While the rise of Winnipeg was meteoric, its relative decline was a slow process that began with a major recession in 1913 and was severely exacerbated by the Winnipeg General Strike of 1919. The strike crippled the city, pitting the city's government and its employers against the majority of its workers and prompting intervention by the federal government on the side of the employers. The strike also marked the high point of ethnic tensions in Winnipeg. The dissonance and bitterness aroused by the strike were not soon overcome. Still, by 1913, Winnipeg was the largest city in Western Canada and the region's industrial, financial, and marketing center. This solid position allowed Winnipeg to survive the severe depression of the 1930's, but even after the end of World War II it did not enjoy the frenzied rate of growth experienced prior to 1913.

The city did, however, adjust from being a "gateway city" to being a "central place city." While Winnipeg's once-vast western hinterland was severely reduced in size by the growth of other western cities, the city remained the largest metropolitan center in the prairie region. And although Edmonton and Calgary became major metropolitan centers in their own right, Winnipeg retained an effective sphere of influence in Manitoba, northwestern Ontario, and most of Saskatchewan. Thus Winnipeg continued to perform metropolitan functions for a large hinterland, providing financial, commercial, and other services.

Winnipeg became more cosmopolitan with each succeeding postwar decade until by 1960 the non-Anglo-Saxon population of the city had reached almost 60% of the total. Winnipeg had one of the most pronounced ethnic mixes of any urban area in Canada and, with the exception of the French and Italians, had a larger percentage of all ethnic groups represented in its metropolitan area than had the country itself.

Ethnic relationships in the city are organized around a wide variety of institutions. The city's Ukrainians, for example, have a thriving array of organizations, including a large number of distinctively designed churches—especially in North Winnipeg—as well as associations, clubs, and businesses including the Ukrainian Labour Temple and a variety of stores, bookshops, workshops, and restaurants. Most Winnipeggers have proved willing to accept enthusiastically a variety of cultures. The city's cosmopolitanism was affirmed by the beginning of Folklorama, an annual, weeklong ethnic festival, in 1970.

More recent trends in Winnipeg suggest the continued evolution of a cosmopolitan community. But overriding the decrease in ethnic discrimination and the increase in political and economic integration is the continued dominance of an Anglo-Saxon culture. What has evolved in Winnipeg is a culture that is more diverse but not fundamentally different from that established by 1900.

ALAN F. J. ARTIBISE
University of British Columbia

WINNIPEG, Lake, win'-ə-peg, a lake in south central Manitoba, Canada. One of the largest lakes in Canada, it is about 260 miles (416 km) long from north to south and covers an area of about 9,421 square miles (24,400 sq km). It lies at an elevation of 713 feet (217 meters). The lake's southern tip is about 40 miles (64 km) north-northeast of the city of Winnipeg.

Lake Winnipeg's chief tributaries are the Winnipeg River, from the east; the Red River, from the south; and the Dauphin and Saskatchewan rivers, from the west. The lake is drained to the north by a series of smaller lakes and the Nelson River, which flows into Hudson Bay.

The lake's name is derived from the Cree Indian words *win-nipi*, "murky waters." Discovered in 1733 by French-Canadian explorers led by Pierre de la Vérendrye, the lake and its tributaries were, until the railroad reached western Canada, an important route for fur traders, explorers, and settlers. Its fisheries are of major commercial importance. Its southern shore is a resort area for residents of Winnipeg.

WINNIPEGOSIS, Lake, win-ə-pə-gō'sis, a lake in southwestern Manitoba, Canada, to the northwest of Lake Manitoba and west of Lake Winnipeg. It is about 125 miles (200 km) long from north to south and has an area of about 2,073 square miles (5,370 sq km). It lies at an elevation of about 831 feet (253 meters).

The lake is separated from Lake Manitoba by only a short distance and drains into it by the Waterhen River. In the days of the fur trade, Lake Winnipeg was reached by a short portage north to Cedar Lake, which drains into Lake Winnipeg by the Saskatchewan River.

WINNIPESAUKEE, Lake, win-ə-pə-sō'kē, a lake in east central New Hampshire, approximately 27 miles (43 km) northeast of Concord. Winnepesaukee (also spelled Winnepesaukee) is 71 square miles (184 sq km) in area. The largest lake in the state, it is very irregular in outline, with many inlets and islands. About 25 miles (40 km) long, it is up to 12 miles (19 km) wide, with a maximum depth of about 300 feet (91 meters). The lake empties into the Winnepesaukee River, which flows southwest to Franklin,

where it joins the Pemigewasset to form the Merrimack River. There are several small towns on the lake shore, the largest being Wolfeboro, and many cottages and summer resorts.

WINNISQUAM, Lake, wīn'is-kwōm, lake, New Hampshire, in Belknap County. It enlarges from the Winnepesaukee River at Laconia and is connected by the river and bays with Lake Winnepesaukee a few miles to the east. Its general extent is from north to south, about $7\frac{1}{2}$ miles, and it varies in width from $\frac{1}{2}$ to 2 miles. Its outlet is by the river to the southwest. Winnisquam village is at the south end.

WINONA, wī-nō'nā, city, Minnesota, seat of Winona County, on the western side of the Mississippi River, 100 miles southeast of St. Paul. It is a trade and industrial center, with railroad repair shops and many food-processing plants, which handle cattle feed, flour, dairy products, and beverages. Bricks are manufactured, and limestone quarrying is important in the region. Patent medicines and cosmetics are also produced. There is an airport. Bridges cross the Mississippi to Wisconsin. Winona State College (q.v.) and two Roman Catholic institutions, St. Mary's College (men) and the College of St. Teresa (women), are situated here. Winona was founded in 1851 as a trading and lumbering point by a Mississippi steamboat captain, Orrin Smith; it was incorporated in 1857. Its early prosperity was based on lumber milling and the grain trade. It has a mayor-council form of government. Pop. 25,399.

WINONA STATE COLLEGE, a state-supported co-educational institution in Winona, Minn. Established in 1858, it was the first normal school west of the Mississippi River. In 1921 it became Winona State Teachers College and in 1957 Winona State College. Degrees granted by the college are bachelor of science, which qualifies the graduate for teaching on the elementary or secondary level; bachelor of arts in liberal arts or business administration; the two-year associate in arts in liberal arts or secretarial work, and the master of science in education in areas of elementary teaching or administration, secondary teaching, and guidance and counseling. The college year consists of three quarters, and there are two five-week summer sessions. Athletic teams are known as the Warriors, and the school colors are royal purple and white. The average annual full-time enrollment is about 4,000.

NELS MINNÉ,
President.

WINOOSKI, wī-nōōs'kē, city, Vermont, in Chittenden County, on the Winooski River across from Burlington to the south. It is a city of diversified industry, with bottling plants and manufactures of boxes and containers, concrete blocks, dresses, furniture, insulated wire, precision weighing instruments, and tools and dies. The Burlington airport is nearby. Winooski is the site of St. Michael's College, a liberal arts college for men, conducted by the Fathers of the Most Holy Trinity. The name of the city is an American Indian word for "land of onions." Founded in 1787, it was incorporated in 1922. Government is administered by mayor and council. Pop. 549.

JOSEPH D. SULLIVAN.

WINOOSKI RIVER or **ONION RIVER**, river, Vermont, rising near Cabot, in the northeastern part of the state. It flows about 90 miles southwest and northwest past Montpelier and Waterbury, breaks through the Green Mountains, and passes Winooski and Burlington to empty into Lake Champlain north of Burlington. The river has cut deep picturesque gorges in places, and there are several falls, notably at Middlesex and Winooski, which furnish water power for manufacturing. After a destructive flood in 1927, three flood control dams were built on tributaries of the river between 1933 and 1937.

WINSCHOTEN, vīn'skhō-tān, town, the Netherlands, in Groningen Province, in the extreme northeast part of the country, near the German border. It is one terminus of the Winschoter Diep (canal), which extends to Groningen, about 20 miles northwest. Winschoten is an important market center, with dairy production, potato-flour milling, and meat-packing industries. It also manufactures agricultural machinery, chemicals, bicycles, and furniture. A brick church dates from the 13th century. Pop. (1957) 15,941.

WINSLOW, wīnz'lō, **Edward**, American colonist: b. Droitwich, Worcestershire, England, Oct. 18, 1595; d. at sea, between Hispaniola and Jamaica, West Indies, May 8, 1655. Born into a well-to-do family, he joined the English Separatist congregation at Leiden, the Netherlands, in 1617 and sailed for America with the first group on the *Mayflower* in 1620. A man of more substance and education than most of the Pilgrim Fathers, he was quickly accorded a place of leadership among them; thus when Chief Massasoit appeared at Plymouth in March 1621, it was Winslow who negotiated the original treaty with him. Winslow's wife died during the first hard winter in the New World, and in May 1621 he married Susanna White, widowed mother of Peregrine White, the first child born in the colony; this was the first marriage performed in New England. His account of the colonists' early explorations and relations with the Indians was probably incorporated by George Morton (q.v.) in the book known as *Mourt's Relation* (1622) and, if so, would be the first published record actually written in the colony.

Winslow returned to England on behalf of Plymouth Colony in 1623-1624 and 1624-1625, publishing *Good News from New England: or A true Relation of things very remarkable at the Plantation of Plimoth . . .* (1624) to encourage continued aid from the colony's backers in London. In 1629 he was made official agent, and he visited England repeatedly thereafter. On one of these visits, in 1635, he was imprisoned for four months at the instigation of Archbishop William Laud for alleged violations of ecclesiastical law.

Meanwhile, Winslow had been busy setting up trading posts in Maine, on Cape Ann, and along the Connecticut River, which laid the foundation for the colony's prosperity. In 1633, 1636, and 1644 he was chosen governor. His reputation as a colonial advocate was such that Massachusetts Bay recruited him in 1646 to defend its interest in England against attacks by Samuel Gorton (q.v.), whom Winslow answered in the tract *Hypocrisie Unmasked . . .* (1646). Caught up in the events of the English Civil War, he never returned to New England. In London, he was instrumental in founding (1649)

the Society for the Propagation of the Gospel in New England and published *The Glorious Progress of the Gospel among the Indians in New England* the same year. He held various appointments under the Commonwealth government and in 1654 was named chief of the civil commissioners who accompanied Adm. William Penn and Gen. Robert Venables in an attempt to seize the Spanish West Indies. He died of a fever during the campaign. Josiah Winslow (q.v.) was his son.

WINSLOW, John, American colonial army officer: b. Marshfield, Mass., May 10, 1703; d. Hingham, April 17, 1774. Grandson of Josiah Winslow (q.v.), he commanded colonial troops at the siege (1741) of Cartagena, New Granada (now Colombia), during the War of Jenkins' Ear and served in Nova Scotia (1744-1751) during and after King George's War. When the French and Indian War began, he led an expedition (1754) up the Kennebec River, where he established Fort Western (now Augusta, Me.) and Fort Halifax (now Winslow, Me.). As commander of the Massachusetts troops under British Lt. Col. (later Gen.) Robert Monckton, Winslow captured (1755) Fort Beauséjour, the last French stronghold on the Isthmus of Chignecto connecting Nova Scotia and New Brunswick, and reluctantly conducted the evacuation of the French population (Acadians) from the area. In 1756 he was put in command of a colonial force that was to take Crown Point on Lake Champlain, but the operation was called off by British headquarters, and Winslow retired from military service.

WINSLOW, John Ancrum, American naval officer: b. Wilmington, N.C., Nov. 19, 1811; d. Boston, Mass., Sept. 29, 1873. Appointed midshipman in 1827 through the influence of Daniel Webster, he fought with distinction in the Mexican War (1846-1848) and rose to captain (1862) during the Civil War while serving with the Mississippi flotilla. In 1863-1864 he commanded the *Kearsarge* in European waters in pursuit of Confederate cruisers that were preying on Union commerce; and on June 19, 1864, off Cherbourg, France, he sank the Confederate ship *Alabama* in one of the most famous naval actions of the war (see KEARSARGE, THE). Winslow was promoted commodore and became a popular hero in the North. Later, as rear admiral, he commanded the Pacific Squadron (1870-1872).

WINSLOW, Josiah, American colonial governor: b. Plymouth, Mass., c. 1629; d. Marshfield, Dec. 18, 1680. Son of Edward Winslow (q.v.), he succeeded Myles Standish, who had died in 1656, as commander in chief of Plymouth Colony in 1659 and was one of Plymouth's two commissioners in the governing body of the United Colonies of New England from 1658 to 1672. In 1673 he was chosen governor of Plymouth, holding office until his death; he was thus the first native-born colonial governor in America. At the beginning of King Philip's War in 1675, Winslow was appointed commander in chief of the United Colonies' forces, but withdrew early the next year because of ill health. He established the first public school at Plymouth (1674). See also UNITED STATES—*The English Colonies in America, 1607-1763*.

WINSLOW, city, Arizona, in Navajo County, 60 miles east of Flagstaff and a mile west of the highway and railroad crossing of the Little Colorado River. It is a division point of the Atchison, Topeka and Santa Fe Railroad, and has sawmills producing ponderosa pine lumber, planing mills, and a molding mill. There is an airport. The Petrified Forest National Monument is 50 miles to the east, and Meteorite Crater 20 miles to the west. To the north is the Hopi and Navaho Indian country. Winslow was founded in 1882 and named for Edward F. Winslow, president of the St. Louis & San Francisco Railroad, then a subsidiary of the Atlantic and Pacific, which later was absorbed by the Santa Fe. The city was incorporated in 1900 under the council form of government and in 1957 adopted its own charter. Population: 8,190.

J. MORRIS RICHARDS

WINSLOW, town, Maine, in Kennebec County, 17 miles northeast of Augusta, on the east side of the Kennebec River at the influx of the Sebasticook, opposite Waterville. It is both an agricultural and industrial center. Dairy products and market gardening are important in the area, and the town has a major paper mill and poultry-processing plant. A blockhouse of Fort Halifax, built in 1754, is preserved. The town, settled in 1764 and named Kingsfield, was incorporated in 1771 as Winslow in honor of Maj. Gen. John Winslow, builder of Fort Halifax. Waterville, formerly part of Winslow, was incorporated separately in 1802. The town, which includes the unincorporated village of Winslow, is governed by three selectmen. Population: 7,997.

See also WATERVILLE.

FRANCIS J. MCCABE

WINSOR, wɪn'zər, Justin, American librarian and historian: b. Boston, Mass., Jan. 2, 1831; d. Cambridge, Oct. 22, 1897. His career as a historian began precociously in 1849 with the publication of *A History of the Town of Duxbury* while he was a freshman at Harvard, class of 1853. Leaving Harvard in 1852 without graduating, he traveled in Europe for two years, acquiring a wide command of languages. From 1854 to 1868 he lived in Boston as an independent man of letters, contributing poetry, criticism, and fiction to periodicals. In 1866 he was appointed a trustee of the Boston Public Library, founded a dozen years earlier as the first sizable library supported by municipal taxes. On the death of its first superintendent, Charles Coffin Jewett, in 1868, Winsor was, by the imaginative action of his fellow trustees, appointed Jewett's successor.

During the next nine years Winsor kept the institution at the head of the new public library movement and contributed notably to the creation of a profession of librarianship in America. Although he was a scholar by temperament, he liberalized library practices and brought books to the people of Boston in an unprecedented manner through the establishment of branches throughout the city. He was a founder of the American Library Association, its first president (1876-1885), president again in 1897, and a founder of the *Library Journal*. As superintendent of the Boston Public Library, he was the ideal man in the right place at the right time, but in 1877, when harassed by the petty maneuvers of Boston politicians, he resigned to be-

me librarian of Harvard University, a post that he held until his death.

In Cambridge, Winsor strengthened the Harvard College Library and embarked upon a remarkably fruitful career of historical and cartographical contributions. He was editor of two great collaborative works: *Memorial History of Boston* (4 vols., 1880-81) and *Narrative and Critical History of America* (8 vols. 1889), which are still useful because of his meticulous bibliographical contributions. His own works include *Reader's Handbook of the American Revolution* (1880), *Christopher Columbus* . . . (1891), *Cartier to Frontenac* (1894), *The Mississippi Basin* (1895), and *The Westward Movement* (1897).

WALTER MUIR WHITEHILL
Director and Librarian
Boston Athenaeum

INSTANLEY, wɪn'stən-lē, Gerrard, English communist: b. Lancashire, England, ?1609; d. England, ?1660. A leading Leveler (see LEVELERS), he first achieved prominence as the under of a small religioeconomic group of extreme Puritans, known as the Diggers because they tried to settle on and cultivate (dig) the common land. In April 1649 he led a small band of Diggers in their attempt to plant waste land at St. George's Hill, Walton-on-Thames, Surrey, and at nearby Cobham, asserting that the common people had "an undeniable equity" in farm and dwell on common land rent-free. The project aroused the hostility of their neighbors, and ultimately the Diggers were forcibly moved by the authorities. Their leader Winstanley was arrested and fined. He was a pioneering communist who expounded his egalitarian ideas in *The New Law of Righteousness* . . . (1649). His ideas were enlarged in *The Law of Freedom* . . . (1652). The authorship of the stirring *Digger's Song* has been attributed to him.

ALLAN M. FRASER.

INSTED, wɪn'stəd, city, Connecticut, in Litchfield County, in a region of hills and valleys at the confluence of the Still and Mad rivers, 9 miles north of Torrington and 27 miles northwest of Hartford. It is a retail and industrial center, where clocks have been made since 1807 and a hosiery company has been in operation more than 75 years. Other industries are the manufacture of miniature precision balls for bearings, electrical appliances, screw machine products, copper wire, transformers, shooks, and nylon pins. In the city are the Gilbert School, Beardsley Memorial Library, and the Litchfield County Hospital. Winsted is known as the Laurel City because of the abundant growth of mountain laurel in the area. Severely damaged by flood in 1955, it has undergone considerable development, and flood control measures have been taken. Winsted was originally chartered as a borough in 1856 and as a city in 1915. It has a council-manager form of government. Population: 8,254.

ROBERT C. SALE

WINSTON-SALEM, wɪn'stən səl'm, city, North Carolina, seat of Forsyth County, in the Piedmont region, 75 miles north-northeast of Charlotte by highway. It is one of the world's principal tobacco centers, with a large tobacco market, and manufacture of cigarettes and tobacco prod-

ucts is the leading industry. Large textile plants produce knitted wear, fabrics, and hosiery. Other products are electronic and air-conditioning equipment, furniture, boxes, and metal and dairy products. The city has an airport and is served by five federal and four state highways and by the Norfolk and Western, the Southern, and the Winston-Salem Southbound railroads, the latter a freight line. There is one television and six radio stations.

Salem College (Moravian, for women), Wake Forest College (Baptist, coeducational), and Winston-Salem Teachers College (coeducational) are situated in the city, which also has many parks and playgrounds and a community art center. The Moravian Church in America (Unitas Fratrum) maintains the headquarters of its Southern Province here. Among the old Moravian buildings are the Brothers House (1769), the Miksch Tobacco Shop (1771), the Community Store (1775), the Salem tavern (1784), the Boys' School (1794), and the Home Moravian Church (1800), with a graveyard called God's Acre, which has become famous for its Easter sunrise services.

Salem was founded in 1766 as a church community by a group of Moravians from Pennsylvania who had come to the region in 1753. In 1849, 51 acres of land north of the city were purchased from the Moravian congregation for the county seat of newly created Forsyth County, and in 1851 a legislative act gave it the name of Winston in honor of Maj. Joseph Winston, who distinguished himself in the American Revolution at the Battle of Kings Mountain (Oct. 7, 1780). The old city of Salem and the new city of Winston were consolidated in 1913. The government is by mayor and board of aldermen and -women under the city-manager form of administration, established in 1949. Population: 143,485.

PAUL S. BALLANCE
Director of Libraries

WINSTON-SALEM STATE UNIVERSITY, The, a four-year coeducational state institution in Winston-Salem, N.C. Founded in 1892 as the Slater Industrial Academy, it was recognized by the state in 1895 and chartered in 1897 as the Slater Industrial and State Normal School. In 1925 the state granted the school a new charter, extended its curricula to four years above high school, changed its name to The Winston-Salem Teachers College, and empowered it to confer appropriate degrees. In 1953 a School of Nursing was added, and in 1957 the privileges of the school were further extended to include the liberal arts and any other specific training which the state Board of Higher Education should wish to include.

In 1969 the North Carolina General Assembly renamed the school. They designated it as Winston-Salem State University, making it a regional university as part of a program that enlarged the state system of higher education. The school confers the bachelor of arts and bachelor of science degrees. Its campus spreads out over a 55-acre site. The school colors are scarlet and white, and the athletic teams are known as the Rams.

WINTER, wɪn'tər, Sir James Spearmen, Newfoundland statesman: b. Lamaline, Newfoundland, Jan. 1, 1845; d. Toronto, Ontario, Canada,

Oct. 6, 1911. Called to the Newfoundland bar in 1867, he entered politics in 1873. While attorney general (1885-1889), he represented Newfoundland with great ability at the Washington Fisheries Conference of 1887-1888 and was knighted (1888). In 1889 he won a brilliant triumph in the celebrated Baird-Walker case before the Privy Council which upheld the right of Newfoundlanders to operate lobster factories on the French shore of Newfoundland. As leader of a delegation to London, Winter prepared a clear and vigorous defense of Newfoundland's position on the French Shore question in 1890 and three years later was made a judge of the Supreme Court, resigning in 1896 to lead the Conservative Party in the general election of 1897. The party was victorious and Winter became prime minister of Newfoundland (1897-1900). He resigned office after his defeat on a motion of no confidence arising out of the controversy over the Reid railway contract signed (1898) by his administration.

ALLAN M. FRASER

WINTER is the coldest season of the year. It begins at the winter solstice, the year's shortest day, and ends at the vernal equinox, when day and night are equally long. In the Northern Hemisphere, winter begins on or about December 22 and ends on or about March 21. In the Southern Hemisphere, winter begins on or about June 22 and ends on or about September 23. Winter occurs in different months in the Northern and Southern hemispheres because the orientation of each hemisphere with respect to the sun changes as the earth travels around the sun.

Except in tropical and polar regions, winter is sharply different from the preceding fall and the succeeding spring. It is marked by low temperatures, snowfalls, cold waves, and reduced sunlight. Most plants slow their growth or become dormant, and many animals hibernate or migrate to warmer regions. See also **SEASON**.

WINTER CHERRY (also known as **CHINESE LANTERN PLANT** and **BLADDER CHERRY**), a perennial (*Physalis alkekengi*) of the nightshade family, often grown as an annual. It has erect, usually unbranched, angled stems 16 to 24 inches high, growing from a thin, creeping rhizome. The leaves are 3 to 4 inches long and 1½ to 2 inches wide, ovate or somewhat squarish with a pointed tip and gradually tapering at the base of the leaf blade along the upper leafstalk. The flowers arise from the leaf axils and are yellowish white, about 1 inch across, broadly bell shaped with 5 recurving lobes. After the flower fades, the calyx soon enlarges to an inflated Japanese-lantern form, 2 inches long, and becomes bright red in color. Var. *gigantea* and *monstrosa*, sometimes offered by seedsmen, produce more conspicuous "lanterns." The inflated calyx encloses a globular, shiny, many-seeded berry which is edible and has a bitter flavor. The fruit has had some medicinal use, but the winter cherry is cultivated mostly for its brightly colored calyxes. Stems, with these attached, are often used for indoor arrangements. The plant has become naturalized in many areas of the United States, especially near gardens. It is native from southeastern Europe to Japan. The genus name *Physalis* is from the Greek *physallis* (bladder), for the inflated calyx characteristic.

HOWARD W. SWIFT

WINTER HAVEN, city, Florida, in Polk County, in the central part of the state, 14 miles east of Lakeland. Encircled by orange and grapefruit groves, it is a major center of the citrus-fruit industry, with packing and canning establishments and plants making various byproducts. Winter Haven is also a popular resort city within easy reach of about 100 small lakes for boating, fishing, and swimming. The city-manager form of government was installed in 1923. Population: 24,725.

WINTER PARK, city, Florida, in Orange County, in the central part of the state, five miles north-northeast of Orlando. It is primarily a cultural and residential center. Tourists are attracted by the equable climate and the boating and fishing on the chain of four lakes in the vicinity. Winter Park is the home of Rollins College, a coeducational institution founded in 1885. Points of interest at the college are the Beal-Malthe Shell Museum, the Morse Gallery of Art, and the Mills Memorial Library. An annual Bach festival also is held at the college. Attractions in the city are the Kraft Azalea Gardens and the Mead Botanical Gardens. Winter Park was founded in 1881 by Loring A. Chase and Oliver B. Chapman as a winter resort on the site of Lake View, a community begun in 1858. It was incorporated in 1887, and a new charter, providing a commission-manager form of government, was adopted in 1949. Population: 22,242.

Winter Park, Fla.

WINTERBERRY, win'tər-bĕr-ē, a common name for some species of the same genus as the holly (*Ilex*). The species most often known as winterberries are *I. verticillata*, common winterberry, Virginia winterberry, or sometimes black

Winter cherry, showing inflated lanternlike calyxes.

lder; *I. laevigata*, the smooth winterberry; and *I. glabra*, the evergreen winterberry, often called inkberry or gallberry. These three species are native to the eastern section of North America. The first two kinds are red fruited, giving a bright display of berries in the winter; the black-fruited evergreen winterberry is best known for its attractive year-round foliage. All are worthwhile garden subjects when grown under proper conditions, including sufficient moisture and somewhat acid soil, but they are difficult to transplant and slow to grow from seed. The common winterberry has been said to have poisonous berries, although the bark has been used for medicinal purposes. Leaves of evergreen winterberry and common winterberry have been used for tea after curing.

BETTY WILSON HIGINBOTHAM.

WINTERGREEN, win'tər-grēn, a name applied to several plants of the family Ericaceae which retain their foliage over winter. In eastern North America, the aromatic little *Gaultheria procumbens* is generally the plant that is referred to by this name. It is a low shrub, barely six inches in height, which is found in rocky woods with creeping stems, half hidden, from which rise erect reddish branches, bearing ovate glossy leathery leaves. These are serrate with crisply tipped teeth and are gathered in a tuft at the top of the slender stalk, the fleshy white or pinkish urn-shaped flowers nodding underneath. The fruits are bright scarlet, mealy, and spicy in flavor and are really enlarged fleshy calyxes which have enclosed the seed capsules and assumed the form of berries. They are sometimes called checkerberries and remain throughout the winter. The whole plant is aromatic in taste and is frequently eaten, foliage, berries, and all. The spiciness is due to the volatile oil of *Gaultheria* which is a stimulant, astringent, and a diuretic drug, but is chiefly used for flavoring confectionery or pharmaceutical preparations. It is a commercial product distilled from the wintergreen where it is plentiful, or from the sweet birch (*Betula lenta*).

The various members of the genus *Pyrola* are also called wintergreen, such as the round-leaved wintergreen, a common plant with a few orbicular or oval long-petioled coriaceous leaves. The flowers are somewhat like those of the lily of the valley and are fragrant. The spotted wintergreen (*Chimaphila maculata*) is another plant found in shady woods. It has a decumbent stem, sending up slender branches, which bear a few lanceolate leaves mottled with white and several white flowers, tinged with purple. Still another wintergreen is the chickweed wintergreen (*Trientalis americana*), a spring-blooming herb with a dainty white starry blossom poised above a whorl of foliage like tiny peach leaves.

WINTERHALTER, vin'tər-häl-tər, Franz Xaver, German portrait painter and lithographer: b. Fenzenschwand, near Sankt Blasien, Baden, Germany, April 20, 1805; d. Frankfurt am Main, July 8, 1873. He studied at the academy in Munich, later in Karlsruhe, and finally in Italy. In 1834 he moved to Paris and gained the patronage of Louis Philippe, but his fame rests on his reputation as the "painter of the Second Empire" of Napoleon III. Most of his sitters were royalty or prominent members of their families. His most famous painting is *Empress Eugénie with Her Ladies-in-Waiting*, and the

Roche

The common or Virginia winterberry. (*Ilex verticillata*).

royal collections of England contain many portraits of Queen Victoria and her family.

Winterhalter's work has not gone out of fashion, unlike that of most of his contemporaries who specialized in "society" portraiture. This is partly due to his sound technical training, but mostly to the fact that he was able to invest his portraits with strong individuality, capturing for posterity the vitality of that vanished era of opulence.

WINTERS, win'tərz, Yvor, American critic, poet, and teacher: b. Chicago, Ill., Oct. 17, 1900; d. Palo Alto, Calif., Jan. 25, 1968. He studied at the universities of Chicago and Colorado and taught English at Stanford University from 1928, receiving his Ph. D. there in 1934. Winters' volumes of verse include *Poems* (1940), *The Giant Weapon* (1943), and *Collected Poems* (1952). He also edited *Twelve Poets of the Pacific* (1937) and *Poets of the Pacific: Second Series* (1949). Winters' chief critical works, collected under the title *In Defense of Reason* (1947), include *Primitivism and Decadence: a Study of American Experimental Poetry* (1937), *Muile's Curse: Seven Studies in the History of American Obscurantism* (1938), and *The Anatomy of Nonsense* (1943). Other works are the critical biography *Edwin Arlington Robinson* (1946) and a later collection of critical essays, *The Function of Criticism: Problems and Exercises* (1957). A examination of W. B. Yeats was published in 1960. He received the prestigious Bollinger Prize for *Poems*, (rev. ed. 1960). Among contemporary literary critics, Winters is distinctive in his emphasis upon the rational nature of poetic language and upon moral discipline as a function of poetry.

WALTER SUTTON

WINTER'S TALE, *The*, a tragicomedy by William Shakespeare, written about 1610-1611, produced in 1611 at the Globe Theatre and at court, and published in the folio of 1623. The source was a popular prose romance by Robert Greene, *Pandosto: the Triumph of Time* (1588). Leontes, king of Sicily, unwarrantedly jealous of the relations between his wife Hermione and his friend Polixenes, king of Bohemia, throws Hermione into prison, where she bears a daughter; Polixenes escapes. Paulina, wife of Antigonus, one of the Sicilian courtiers, brings the baby to Leontes, who orders her abandoned and refuses to believe in his queen's innocence until his son Mamillius dies and Paulina reports Hermione's death.

The abandoned infant daughter is found and reared by a shepherd in Bohemia where, as Perdita, she and Prince Florizel fall in love. Denounced by Polixenes, they flee to Sicily, where their identities are discovered. Leontes, still overcome with remorse, is invited by Paulina to see a statue of his wife. The statue proves to be the living Hermione, and all are joyfully reunited. Paulina, the rogue Autolycus, the pastoral episodes (reminiscent of Warwickshire), and the preservation of Hermione are Shakespeare's inventions to provide comedy and a happy ending; Greene's euphuized language is converted into lively prose and a verse which runs the gamut from the tortured staccato of Leontes to the lyrical utterances of the young lovers.

Criticism has stressed the insufficient motivation of Leontes' jealousy, the lapse of 16 years between Acts III and IV, the shift of interest in characters, and the surprise ending; but all this fails to take into account the play's title and type. A winter's tale was an old wives' tale, serious but not tragic, full of strange marvels and varied action, told around the hearth on winter nights; and tragicomedy demanded swift and violent emotions and a happy ending to its fantastic narrative. There is little pretense to realism: Leontes' repentance is as long as his jealousy is sudden, a courtier is eaten by a

bear, a shepherdess is really a princess, and a dead woman comes to life. The unity is not one of plot but of atmosphere. Shakespeare gave his "scene such growing/As you had slept between"—between, that is, the waking, dozing, and dreaming which traditionally would accompany a winter's tale.

The playwright's skill and success are attested by the six court performances before 1642. The sophisticated Restoration would have none of the play, but it was revived in 1741, adapted as *Florizel and Perdita* by David Garrick, restored in the 19th century—Mary Anderson doubled as Hermione and Perdita in 1887—and is now frequently on the stage.

City University of New York

WINTERSET, win'tər-sēt, a drama by Maxwell Anderson (q.v.), produced in 1935. The play combines contemporary subject matter with the technique of poetic drama which Anderson had previously developed in his more traditional historical tragedies. The plot was suggested by the famous Sacco-Vanzetti case (q.v.). Mio, the protagonist, is the son of Romagna, a man who had been innocently executed for murder, and he is determined to carry out a lifelong obsession to avenge his father. But he falls in love when he meets Miriamne, the sister of the one witness who had it within her power to save his father. Anderson probes the moral dilemma of this situation, and when the real murderer appears, Mio, unfortunately, is helpless to act and loses his own life.

Winterset is now regarded as the playwright's best and most successful play. It falls short of great drama to the extent that Anderson cannot be called a great poet, but it is an excellent and representative work of American theater.

WINTERTHUR, vin'tər-tōor, city, Switzerland, in the Canton of Zurich, 12 miles northeast of Zurich. Its population is mainly German speaking. Located on a rolling plateau, it is both a railroad and industrial center, manufacturing cotton-mill, electric, and hydraulic machinery, as well as diesel engines and steam and electric locomotives for world export. It is noted for the Gothic Stadt-Kirche (1264-1515), with towers of later date; there are two castles (15th and 17th centuries), a museum of Roman antiquities, several libraries, and a museum devoted to paintings by Swiss artists.

Originally a Roman settlement known as Vitudurum, Winterthur in 1180 became the property of the counts of Kyburg. In 1264 it was sold to the Habsburgs, who maintained it as a stronghold until 1460, when the Swiss Confederates, in their struggle for liberty, conquered the Canton of Thurgau in which it was then located. It was sold to the Canton of Zurich seven years later.

In the 17th and 18th centuries Winterthur faience stoves enjoyed a great vogue in Europe; a notable collection of these is to be found in the industrial museum that is located there. In addition, Winterthur was the home of Anton Graff (1736-1813), who achieved fame as the court painter at Dresden. Population: (1977 est.) 87,900.

THE HENRY FRANCIS DU PONT WINTERTHUR MUSEUM

Winterthur Museum features period rooms from historic houses. Readbourne Parlor (above) is furnished in Queen Anne style. Montmorenci Stair Hall (right), with its graceful, free-hanging staircase, is from a house in North Carolina.

THE HENRY FRANCIS DU PONT WINTERTHUR MUSEUM

WINTERTHUR MUSEUM, win'tər-thər, a museum in Winterthur, Del., near Wilmington, noted for its collection of early American decorative arts. Situated in a great country house surrounded by a private park, the museum spans two centuries of American arts and crafts, dating from the 17th to the early 19th century. Nearly 200 period rooms and special displays contain thousands of objects, and include outstanding examples of domestic architecture, furniture, textiles, pewter, silver, ceramics, paintings, and prints.

The Museum Collection. Drawing rooms, parlors, dining rooms, bedrooms, and simulated outdoor settings, each complete to the final detail, survey the early American domestic scene. With very few exceptions, all the furniture, silver, and pewter on display was fashioned in colonial America or during the early years of the republic.

Winterthur is open to visitors daily except Sundays, Mondays, and major holidays. Tours of the main museum, which may be seen by appointment only, include the Court, reconstructed sections of house fronts that give the effect of a small village square; Shop Lane, a simulated

street lined with shop fronts; and interiors of the Queen Anne, Chippendale, Federal, and Empire periods. No advance reservation is required for the South Wing, which contains 14 period rooms.

A favorite attraction is the Winterthur Gardens. These 60 acres (24 hectares) of naturalized plantings of trees, flowers, and shrubs are open without appointment from mid-April through October. The azaleas are at their peak in early May.

The museum also administers two fine colonial houses in Odessa, Del. The Corbit-Sharp House (built in 1774) and the Wilson-Warner House (1769) have been carefully restored and furnished with antiques. Both are open to the public.

History. The original house was built in 1839 by James Antoine Bidermann and his wife, the great-aunt of Henry Francis du Pont. After acquiring the estate in 1926, du Pont made numerous renovations and improvements, adding rooms from other historic houses along the Eastern Seaboard and furnishing them with antiques he had collected. The Henry Francis du Pont Winterthur Museum was opened in 1951.

AMERICAN ANTIQUARIAN SOCIETY

John Winthrop, governor of Massachusetts Bay Colony.

WINTHROP, win'thrəp, **John**, American colonial governor: b. Edwardstone, Suffolk, England, Jan. 12, 1588; d. Boston, Mass., March 26, 1649. As a youth he occupied a favored place, thanks largely to his grandfather, Adam Winthrop. After rising from apprentice clothworker to prosperous cloth merchant, Adam had acquired Groton Manor (1498) near Edwardstone, which passed to John's father, Adam, Jr., a lawyer. John's obscure early years were spent mainly in rural scenes. At the age of 14 he entered Trinity College, Cambridge, where he remained less than two years. While there, afflicted with a fever, "neglected and despised," and deprived of "youthful joys," he experienced a religious awakening, as a result of which he resolved to resist temptations, atone for past lapses, and seek the divine presence. Thereafter the religious strain in his nature, derived perhaps from his mother, Anne (Browne) Winthrop, was ascendant. He studied law, practiced successfully, served as justice of the peace, and was commissioned an attorney in the court of wards and liveryes in London. In 1605 he married Mary Forth, who died in 1615; he then married Thomasine Clopton, who died on Dec. 8, 1616. His third marriage united him with Margaret Tyndal in April 1618. Soon afterward his father entrusted to him the care of the family estate, and he became lord of the manor of Groton.

Young Winthrop was drawn to Puritanism by his independent spirit, his sense of kinship with God, and his fondness for weighty sermons. After 1625 he became dissatisfied with his life in England. In 1629 Charles I attacked the Puritans and imprisoned their leaders; his aggressive prelate, Bishop William Laud, sought to subject them to beliefs and modes of worship that were offensive to them. Deprived of his commission as attorney in the court of wards and liveryes, Winthrop came to feel that if he stayed in England, his talent for public affairs would

be "buried." He deplored the fact that hard times were making burdens of poor children, servants, and neighbors, whereas "if things were right, they would be the chiefest earthly blessing."

On March 4, 1629, Charles I chartered the Massachusetts Bay Company (q.v.). It included many Puritans among its members; several of them men of substance, who approached Winthrop with a proposal to settle in Massachusetts if he would lead them in building a Puritan commonwealth. In August 1629 he and 11 associates signed the Cambridge Agreement, pledging to move to Massachusetts if the company's charter and governing body (or General Court) might be transferred with them. The company soon agreed to this; Winthrop was then elected governor, and the great migration to Massachusetts began in the spring of 1630 with his departure in the *Arbella*.

For nearly 20 years Winthrop was the leading figure in Massachusetts, serving continuously as governor, deputy governor, or member of the Executive Council. His ideas and actions left a strong imprint on the colony. He disliked political democracy and thought that political authority should be vested only in people who were good and devout. Such a "spiritual aristocracy" would include persons of different social ranks. However, he preferred that government should be administered by a continuing elite composed of worthy men of wealth and good breeding. Such leaders should devote their talents to public service, acting as stewards of God to advance the coming of His kingdom on earth.

At the outset Winthrop wished to have the colony governed by a very small group of voters, members of the Massachusetts Bay Company, who had migrated in 1630. However, he yielded when a number of other settlers insisted that they be taken in as members of the company and allowed to vote. He then secured the adoption of a rule which required that voters must be members of a Puritan church. Afterward he tried so to curb the voters that they would merely elect the governor and his council; the latter would then exercise the principal legislative powers. Again he was forced to yield and to accept the demand of the voters that such powers be exercised by their deputies in the legislature (General Court). Later, in 1644, he sponsored an arrangement by which the council should act as a second house of the legislature, with a veto on the deputies, who were chosen by the voters in their towns.

When governor, Winthrop was lenient in dealing with individuals who committed personal offenses but stern in resisting opponents of the Puritan state. One of his foremost enemies was Anne Hutchinson (q.v.), leader of a group called Antinomians, who asserted that favored persons received messages directly from God which were presumably superior to the prosaic utterances of Puritan divines. When she implied that most of the ministers did not receive such messages, she threatened to destroy their influence as official guides of the people. She criticized her pastor at Boston and fomented strife within the church. Such "meddling" angered Winthrop, who thought that woman's place was in the home. He led a campaign against her which ended in her expulsion from the colony in 1637.

Not an original thinker, Winthrop was gifted

practical affairs and in the art of government. He brought much wealth to the colony; the sale

Groton Manor had netted him £4,200. He acquired a substantial landed estate in Massachusetts, which was worked by servants; he believed it proper that the labor of such workers should support leaders like himself, who devoted their energies to public service. He strove to rule with justice and mercy, and frowned upon usury, profiteering, luxury, and extravagance. Private estates, he said, cannot subsist in the ruin of the public, and he used much of his wealth for public purposes. Animated by religious faith and devoted to authority, rank, order, discipline, and public service, he believed that man should have liberty to do only what he and other strict Puritans deemed to be "good, just and honest." At the time of his death in 1649, the colony had been securely established.

Following his third wife's death in 1647, Winthrop had married a widow, Martha Cotyore of Boston. His four wives bore 16 children, of whom reached adulthood. His descendants of the Winthrop name were or are descended from his sons John, Jr., Adam, or Samuel.

CURTIS P. NETTELS,
Professor of American History, Cornell University.

WINTHROP, John, American colonial governor: b. Groton, Suffolk, England, Feb. 12, 1606; d. Boston, Mass., April 5, 1676. The eldest son of John and Mary (Forth) Winthrop, he was educated at grammar school and at Trinity College, Dublin, and was admitted to the bar in 1625. When his father went to Massachusetts in 1630, he remained in England to dispose of the family estate. In 1631 he married Martha Fones, who accompanied him in August when he sailed for Boston with his stepmother and several of the Winthrop children. He immediately became a leader in the colony.

After the death of his wife in 1634, Winthrop returned to England, where he married Elizabeth Peade. He was then commissioned by William Jennes, 1st Viscount Saye and Sele, and Robert reville, 2d Baron Brooke, to begin a settlement, Aybrook, on the Connecticut River—a work which he supervised after his return to Massachusetts in 1635. He finally settled in Connecticut and was elected governor in 1657; reelected 1659, he held the governorship continuously for the rest of his life. In 1662 he secured from Charles II a charter for Connecticut which gave full sanction to the Puritan institutions that evolved there.

Theology meant less to Winthrop than science, particularly chemistry. He was elected a fellow of the Royal Society in London, to which he presented papers on the natural features of New England. Using a small telescope, he anticipated the discovery of a fifth satellite of Jupiter. He was also an amateur physician, whose cures

evidently owed more to his faith-inspiring presence than to his remedies.

Winthrop realized that New England was deficient in native products that could be exchanged in England for needed articles. He therefore tried to foster local industries for the production of salt, ironware, pitch, tar, and graphite—either to supply New England with finished goods or to increase its exports. He established two ironworks near Boston; although they soon failed, they proved that useful articles of iron could be made in New England. In 1651 Connecticut granted to him such lead, copper, or tin mines, salt springs, or deposits of antimony, vitriol, black lead, alum, stone salt, "or any other like" as he might find and develop within the colony. He also pioneered in proposing the issuance of paper currency by banks.

Winthrop was America's first outstanding industrial promoter, but he did not profit from his ventures; his wealth consisted mainly of land. He traveled extensively, and wherever he lived, his neighbors urged him to stay or to return; those at Ipswich spoke of him as "our Lieutenant Colonel so beloved of our soldiers." His industrial projects did not bear much fruit during his life: he was a pioneer, ahead of his time, who pointed out to successors the main lines of future development: mining, manufacturing, commerce, banking, medicine, chemistry, and discoveries in outer space. As an economist he perceived the special needs of undeveloped countries and devised plans for meeting them. One of his sons, John (known as Fitz-John) Winthrop (1638-1707, q.v.), became governor of Connecticut; another, Wait Still Winthrop (b. Feb. 27, 1642), served as chief justice of Massachusetts.

CURTIS P. NETTELS.

Further Reading: Freiberg, Malcolm, ed., *The Generations Joined: Winthrops in America* (Massachusetts Hist. Soc. 1977); Mayo, Lawrence S., *The Winthrop Family in America* (Massachusetts Hist. Soc. 1948); Taylor, R. J., *Colonial Connecticut: A History* (Kraus 1979).

WINTHROP, John (usually known as FITZ-JOHN WINTHROP), American colonial governor: b. Ipswich, Mass., March 14, 1638; d. Boston, Nov. 27, 1707. Son of John Winthrop (1606-1676, q.v.), he attended Harvard College but left to take a commission in the English Parliamentary Army, with which he served until the Restoration. Returning to America in 1663, he settled in Connecticut and eventually was elected to the General Assembly. Winthrop was made chief military officer for New London County in 1672 and took a prominent part in the Indian wars thereafter. During Sir Edmund Andros' administration as governor of the New England colonies, he sat on the council, but following Andros' overthrow (1689) he joined in reinstating Connecticut's separate government. The next year he was given command of an expedition against the French in Montreal; the promised supplies from Gov. Jacob Leisler of New York failed to arrive, however, and Winthrop canceled the mission. In an attempt to shift the blame from his own shoulders, Leisler arrested Winthrop and threatened to execute him, but Winthrop was rescued by local Indians of his own army. Exonerated by the Connecticut Assembly, he was rewarded and again took his place in the government of the colony. He was governor of Connecticut from 1698 until his death and enjoyed great popularity among the citizens.

WINTHROP, John, American scientist: b. Boston, Mass., Dec. 19, 1714; d. Cambridge, May 3, 1779. A descendant of the first John Winthrop, he graduated from Harvard College in 1732, and from 1738 until his death was Hollis professor of mathematics and natural philosophy there. Winthrop was one of the outstanding American scientists of the 18th century and exercised much influence on the thought of his contemporaries, including Benjamin Franklin and Benjamin Thompson (Count Rumford). His research was published in the *Transactions* of the Royal Society of London, and he was elected to the society in 1766.

Among Winthrop's important scientific studies should be mentioned his sunspot observations (1739) and his study of the transit of Mercury over the sun (1740, 1743, 1769). At Harvard he established the first laboratory of experimental physics in America (1746) and inaugurated the study of differential and integral calculus in the curriculum (1751). During the transit of Venus in 1761, Winthrop, under the auspices of Harvard, led the first astronomical expedition to St. John's, Newfoundland. During the American Revolution he supported the cause of the colonies and acted as an adviser to George Washington.

WINTHROP, town, Massachusetts, in Suffolk County, about four miles northeast of Boston. Situated on the peninsula enclosing Boston Harbor on the north and east, it is a residential suburban community with no major industries. Several yacht clubs have headquarters here. Settled in 1635 and named for Gov. John Winthrop, it was incorporated in 1852 upon being separated from North Chelsea. Winthrop has the representative town meeting form of government. Population: 18,127.

WIRE, wîr, a filament of metal of uniform diameter. In modern practice it is formed by drawing the metal through a succession of wire-drawing dies, each one progressively smaller than the preceding one, until it has been reduced in diameter to the desired finished size.

Drawing.—The starting point in the manufacture of wire is rod, which conventionally is formed by hot-rolling wire billets or bars to standard diameters of $\frac{1}{2}$ (more accurately 15/32), $\frac{3}{8}$, or $\frac{1}{4}$ inch. For heavy wire products the finishing size may be larger. The rod is then drawn into wire in wire-drawing machines. A broad distinction between rod and wire is that rod is a hot-rolled and wire is a cold-drawn product.

Wire varies in size from approximately 1 inch down to 0.0004 inch in diameter. Some wire has been drawn smaller than this, but there is little commercial application for wire in the ultrafine sizes. A 0.0004-inch wire is approximately $\frac{1}{20}$ the size of a human hair in thickness.

The material from which wire may be drawn is any ductile metallic element—iron, copper, aluminum, gold, silver, platinum, lead, zinc, tungsten, molybdenum, and many other metals, or combinations of these and other metallic elements to make alloys, which are mixtures of two or more elements. Most wire is drawn cold, that is, it enters the first die cold; but some metals, like very hard alloy steels, tungsten, and molybdenum, must be heated before they can be made sufficiently ductile to permit them to be drawn.

Reductions in the diameter of the wire are achieved by means of drawing dies, which are usually made of tungsten carbide or diamond. The first, which approximates the diamond in hardness, is used for all coarse and intermediate wire sizes; the second is used for fine wire, which is any size under 0.025 inch in diameter. Reductions of 25 percent in cross-sectional area are generally made in each pass through the die, but the percentage may vary up or down, depending on the metal and the results desired. Music wire, a high-carbon specialty wire of excellent quality, is drawn normally with reductions of only 10 percent per pass.

While the great bulk of wire is drawn round, it may also be drawn into other shapes. Flat wire is made by passing the wire through flattening rolls; other shapes, many of them quite complex, are produced by drawing round wire through specially shaped dies.

Lubrication.—All alloys of iron, of which steel is the principal one, are "dry drawn"; that is, the wire is passed through a lubricant box which is placed immediately ahead of the die and contains a powdered soap, tallow, or grease mixed with lime. This lubricant is essentially dry, but moist enough to be picked up by the wire in its passage through the box. Soluble soaps in a water solution or oils are used for many non-ferrous metals of any size, and always for wire of the fine-size range, the liquid lubricant being pumped over the dies to maintain continuous lubrication and facilitate cooling.

Lubricants of many special kinds have been developed for different metals, drawing conditions, and wire finishes. These lubricants may contain special additives, such as metallic stearates (salts of stearic acid) for metals like copper or aluminum, which help the base lubricant resist the great pressures and the heat developed in the process of drawing. For metals that must be heated before drawing, only such highly heat-resisting materials as graphite or molybdenum disulphide can be used as lubricants, as these substances will not burn or char.

Rolling and Descaling Rod.—In the process of hot-rolling wire rod, the material acquires a heavy oxide scale that must be removed before it can be drawn. This is accomplished by "pickling" the rod in a hot dilute bath of sulphuric or other acid. In the late 1950's a number of mechanical processes were developed for removing scale. These processes are generally in two stages: (1) shotblasting and flexing the rod over two or more sheaves in different planes, followed by (2) a brushing and air-cleaning operation to remove the loosened scale and dust. These methods, widely used in Europe, have found growing favor in the United States for some types of steel.

In the 1950's a new method of making aluminum rod found wide acceptance, principally among the larger independent producers. The process pours molten aluminum continuously into a rotating wheel mold, from which it passes into a series of rolls to be formed into rod. A somewhat similar process became available commercially in 1961 for producing copper rod.

Annealing.—Wire becomes work-hardened from drawing, since in the wire's passage through the dies the grains of metal are severely deformed and are under great internal stress. Experience has shown that each metal has a different work-hardening limit, beyond which, if further drawn,

is so brittle that it will break. This point may be reached after 4 to 8 passes through the drawing dies for steel wire, or 18 to 22 passes for iron or copper wire. When the wire arrives at this soft state of hardness, it must be placed in an annealing furnace, heated to a temperature somewhat under its critical point (below melting), and allowed to remain there until all of the wire has become heated uniformly throughout. Annealing is a stress-relieving process of heat treatment by which the grains of the metal resume their normal shapes, thus becoming "soft annealed." Further drawing then can be done if necessary. Such annealing produces the softest and most ductile condition of the metal.

Automation.—Because of the many different sizes and sizes of wire manufactured in one mill, it has been difficult to achieve automation in this industry, but great strides have been made in this direction since 1950. There is a strong tendency to combine processing operations in one continuous train, when the production of one item is sufficiently large to justify this. One large mill producing communication wire has developed an automatic continuous line in which drawing, annealing, tinning, cleaning, insulating, and the final coiling of the wire on a take-up frame are combined and synchronized through electronic controls that require a minimum of attention. Similar operations, in less comprehensive combinations, exist throughout the industry.

Finishes and Uses.—Wire comes in an estimated 12,000 sizes, kinds, and finishes. It may be galvanized, aluminized, tinned, cadmium plated, rubber or plastic coated, or enameled. In fact, almost any metal may be plated onto a base metal for whatever finish is desired.

Some of the more common uses of wire are for fences, bolts, nuts, screws, rivets and washers, pins, needles, chains, wire ropes and cables, springs, trays, baskets, rings, staples, nails, wire cloth, concrete-reinforcing fabrics, and for that extensive class of products called electric wire and cable.

Drawing Speeds and Bundle Sizes.—Modern finishing speeds of wire are very high. Many mills will finish steel wire at a speed of 4,000 feet per minute and copper wire at speeds of 8,000 to 10,000 feet per minute. Paralleling this, modern continuous rod-rolling mill will turn hot rod at a finishing speed of 6,000 feet per minute.

Wire now can be supplied in bundles of any weight desired; weights of 4,000 pounds of one continuous length of wire are produced by the multiple practice of butt-welding one end of a rod to another by electric-resistance welding before the rod enters the wire-drawing machine. The only limitation to coil weight is the ability of the take-up equipment to handle or hold the wire. Much fine wire, however, is put up on reels or spools in 1-, 5-, and 25-pound weights, or heavier.

HISTORY

The history of wire is shrouded in antiquity. It is known, through archaeological discoveries, that wire was made in ancient China, Egypt, India, and some Middle East countries. Such wire usually was formed to make precious metal jewelry. In Exodus 28:22-26 the sacerdotal vestments of Aaron are described as being adorned with chains and rings of pure gold. These must have been made of wire. It is assumed that such

wire was not made by drawing, but by hammering out a piece of metal on an anvil, turning it constantly to keep it round. This hammering elongated the piece of metal until it assumed the desired diameter and length; most lengths, however, were quite short. Ornaments of gold wire have been found in the tombs of the Egyptian pharaohs, and in the ruins of Pompeii a section of a two-strand bronze wire was unearthed and is now on exhibition in a Naples museum.

Middle Ages.—During the Middle Ages one of the principal uses of wire was for making the rivets and flexible elements in armor. Reduction in size by hand-pulling through a die is known to have existed in the year 1000 A.D., and historians place the probable first use of a die about 300 years earlier. Crude samples of what are believed to be wire-drawing dies have been found in Europe. Some are iron and others are stone plates with holes of varying sizes drilled through them.

Rudolf of Nürnberg is credited with having developed, in 1350, a method of wire drawing which used water power. It was a closely guarded secret until 1500, when one Eobanus Hessus wrote in Latin a description of the process: "One can see how the work is done by the weight of wheels and with what great power they can stretch the iron and how they perform what a thousand men could not do before the art was discovered. A great wheel driven by the force of water drives with itself a powerful shaft whose surface is armed with many teeth and when this shaft is turned by the water power these teeth push and drag with them the parts of the machine which, although they resist, are unable to withstand the terrific force of the shaft, the wheel and the water. The tongs seize with their sharp teeth the raw iron, smooth it into round wire, which is taken out of the tongs and coiled into a thousand convolutions."

Records show that there were eight wire-drawing establishments in Paris in 1292, although there exists no description of their methods. A license to manufacture card wire (for carding wool) in England was granted by the crown in 1435 to the journeymen of card-wire drawers. Impetus was given to the English wire industry in 1564 when one William Humphrey brought a group of wire drawers into the country from Saxony. He established a mill known as the Tintern Abbey Works, where water was used for power.

Beginnings in America.—Manufacture of wire in the colonies prior to the American Revolution is not known to have existed. In 1640 the General Court of Massachusetts was petitioned for a grant of money to set up a wire-drawing establishment, the petitioner declaring that he had the necessary tools. This and subsequent petitions were not acted upon favorably. During the Revolutionary War a number of grants were made to assist qualified persons to manufacture card wire, but apparently all of the businesses shut down when the product became available from England again following the close of the war.

The War of 1812 brought about the reestablishment of a number of wire-making businesses in the United States. The only one known to have survived is the Spencer Wire Company, which has carried on continuously, despite changes of ownership and name. This and other early 19th century wire firms were located principally in or near Worcester, Mass. As transporta-

tion and population moved westward, however, the wire industry also spread, and before the middle of the 19th century, wire mills were well established along the Ohio River in the Pittsburgh area, where coal was plentiful.

The 19th and 20th Centuries.—Five factors contributed to the rapid development of the art of wire drawing in the 19th and earlier 20th centuries: (1) the invention of the telegraph by Samuel F. B. Morse in 1835 and the installation of the first line between Baltimore and Washington in 1844; (2) the Homestead Act of 1862, which opened to settlement the great plains area of the West, increasing the need for fencing, principally barbed wire; (3) the development of the telephone by Alexander Graham Bell during the 1870's; (4) the invention in 1880 by Thomas A. Edison of the electric light, which required large quantities of wire; and (5) the development in Germany in 1926 of the carbide drawing die, introduced into the United States in 1928. (Carbides are a mixture of carbon, cobalt, and tungsten, pressed and fused together.)

Prior to the carbide-die era, wire drawing was still a slow procedure, although improved, hardened drawing plates had been developed. Carbide dies made the drawing of wire a considerably faster and more accurate manufacturing process. Since their invention, they have been improved further; drawing machine designs have also become more efficient, and larger and larger bundles (coils) of wire have been produced. As the demand for higher drawing speeds has increased, manufacturers have devised circulating water-cooling systems and air-cooling mechanisms to keep down the heat that is developed in the process of drawing, since lubricants for the dies and the dies themselves would have considerably shortened lives if the heat were not drawn off. With the adoption of the carbide wire-drawing die, the industry has evolved from an art to a science, in which such technicians as the metallurgist, the chemist, and the plant engineer prescribe the procedures and constantly check the results.

In the 20th century wire reaches into the lives and touches the experiences of everyone. Telephones, automobiles, electric lighting systems, household appliances, and even the wire-producing equipment itself would not be possible unless wire in some of its many forms was embodied in their construction.

WIRE GLASS, a combination of wire and glass used in building construction, particularly for skylights and for office and factory windows. The glass may be polished, or it may contain any of a number of decorative figures on the surface. The wire netting is completely embedded in the glass during the process of manufacture. The temperature at which the wire is embedded in the molten glass insures cohesion between the metallic netting and the glass, and the two materials become as one, so that if the glass is broken by shock, intense heat, or other causes, it remains essentially

intact. Wire glass thus combines the strength of both the wire netting and the glass plate.

Wire glass will break, but it will not scatter. It can be fractured, but it will retain its place in its frame, so that the perils incident to falling glass and the ingress or egress of draft and flame are greatly minimized. For this reason, it has proved to be one of the most effective fire retardants available for building purposes, and its usefulness in this respect outweighs all other values. In addition, because of its mechanical strength, it eliminates the need for using half-inch glass in skylights.

The modern method of manufacturing wire glass is the continuous-rolling process, in which the molten glass flows from the spout of the furnace through a pair of water-cooled rolls which form it into a ribbon while chilling it and imprinting the figure on it. The ribbon of glass then travels through an annealing oven, after which it is cut to size. The wire netting, inserted continuously into the molten glass at the point of rolling, is pulled along by the motion of the ribbon itself and completely encased within the glass.

FRANK DORR.

WIRE TAPPING AND ELECTRONIC EAVESDROPPING are methods used for overhearing a conversation without the knowledge of the participants in that conversation. Such secret listening by private individuals is condemned in the United States by federal law, a prohibition reinforced by legislation in most states.

It is a matter of serious controversy whether police officers in the investigation of crime should be permitted to tap wires, or to eavesdrop on conversations by using sensitive microphones—a technique often called "bugging." The argument in favor of police use of these methods is that the technique is an indispensable tool of effective police work in many cases, particularly in the investigation of organized crime, espionage, sedition, and kidnapping.

A Historic Dissent. In 1928 the U. S. Supreme Court held in *Olmstead v. United States* that wiretapping was not forbidden by the 4th Amendment to the Constitution. The language of that amendment forbids "unreasonable searches and seizures," and the majority of the court saw no "search" or "seizure" in the case of electronic interception performed at some distance from the location of the telephone instruments. Justice Louis Brandeis, however, delivered a classic dissent setting forth the main line of argument against eavesdropping, private or public. He spoke of the right "to be let alone—the most comprehensive of rights and the right most valued by civilized men. . . . It is . . . immaterial that the intrusion was in aid of law enforcement. Experience should teach us to be most on our guard to protect liberty when Government's purposes are beneficent. . . . The greatest dangers to liberty lurk in insidious encroachment by men of zeal, well-meaning but without understanding."

A second important objection that is made to electronic eavesdropping is that the police must hear many conversations in order to overhear those that may be evidence of crime. Thus it is impossible to protect the innocent or to respect the privilege of nondisclosure that the law affords some communications, such as those between doctor and patient, and lawyer and client.

Subsequent Rulings. After *Olmstead*, the Supreme Court held in *Nardone v. United States*

(1937) that wiretapping fell within the prohibition of section 805 of the Federal Communications Act, which forbids the interception and divulgence of any telephone conversation. The *Varadone* reading of federal law, however, was in effect a flat prohibition of all wiretapping, even that which might yield important evidence of serious crime. Further, in practical results, the case did not operate to restrain wiretapping by state law enforcement officers.

In *Goldman v. United States* (1942), the Supreme Court held that it was not a violation of the 4th Amendment to overhear talk if one used a secret microphone not placed by trespass. In the 1950's and 1960's several states, including New York, passed statutes forbidding all electronic eavesdropping (including wiretapping) unless done by police pursuant to a court order issued on information that the listener would discover evidence that crime was being committed.

Any form of eavesdropping raises a special 4th Amendment question because the amendment provides that warrants may not be issued unless they "particularly" describe "the place to be searched, and the . . . things to be seized." Obviously, one cannot describe conversations that will occur in the future.

Berger v. New York (1967) tested the constitutionality of the New York State law as it applied to a court-approved eavesdrop involving a microphone that had been placed by trespass in a person's office. The New York statute was held unconstitutional on the ground that the particularity requirement had not been met. The order had merely recited that "evidence of crime" would be obtained, without telling exactly what crime and what kind of conversations were anticipated.

Legal developments were carried a step further in *Katz v. United States* (1967). Federal officers monitored a public phone booth that was being used to carry on gambling operations. The government argued that the 4th Amendment's protection of privacy did not apply to certain places such as the phone booth and, further, that the monitoring device, unlike that in the *Berger* case, had been installed without committing a trespass. The Supreme Court disagreed on both points. The 4th Amendment, the court said, "protects people, not places." Further, the fact that the device had been installed without an unlawful entry was not significant. The speaker had no right to privacy not from physical intrusion into the booth, but from the "uninvited ear."

Constitutional Limits. The opinions in *Berger* and *Katz*, however, together with another opinion in *Osborn v. United States* (1966), suggest that some eavesdropping is permitted under the Constitution. It must be authorized by a judge, the judge's order must be based on a reasonable belief that evidence of a specific crime will be forthcoming, and it must be narrowly circumscribed as to the conversations to be heard and the time during which interception is permitted. In 1972, in *United States v. United States District Court for the Eastern District of Michigan*, a unanimous Supreme Court rejected a contention by the U.S. government that it had the right to engage in the wiretapping of domestic communications considered a threat to national security without first obtaining court approval.

Dean, University of Virginia Law School

WIREWORM, *wir wûrm*, the larva of any one of several species of beetle of the family Elateridae (q.v.), so called because they are cylindrical and elongate, with a hard, brown or yellowish, shining skin. The adult females lay their eggs in the soil about the roots of grasses and other plants. Upon hatching, the larvae feed on the roots and underground stems of many plants. A few live in rotten logs and are predacious on other larvae. Several years are usually necessary for development from egg to adult, most of this time being spent in the larval stage. They pupate in the soil and are among the most destructive of garden pests. Several species are very destructive to potatoes, rendering them unfit for sale. Corn and other cereal crops, wild grasses, and some leguminous field crops are often severely damaged by wireworms. Some millipedes, especially species of *Lulus*, are sometimes falsely called wireworms; they are similarly injurious.

WILLIAM D. FIELD.

WIRT, *wûrt*, William, American lawyer, political leader, and author: b. Bladensburg, Maryland, November 8, 1772; d. Washington, D.C., Feb. 18, 1834. He received a grammar school education, studied law, was admitted to the bar in 1792, and began practice in Culpeper County, Va. While acting as assistant attorney in the prosecution of Aaron Burr for treason in 1807, Wirt demonstrated a learning and eloquence that was remarkable and established his reputation as one of the foremost lawyers in the country.

In 1817, Wirt was named attorney general of the United States by President James Monroe and served continuously until the end of John Quincy Adams' administration (1829), appearing in such famous cases as *McCulloch v. Maryland*, *Gibbons v. Ogden*, and the Dartmouth College case. He did much to systematize the operating methods of the department and was the first to preserve his opinions as precedents for the future. In 1832 he accepted the nomination to be the presidential candidate of the Anti-Masonic party, but the Whigs refused to adopt him as their nominee.

Wirt attained considerable fame as an author, especially for his series, *The Letters of the British Spy* (1803).

WIRT, William Albert, American educator: b. Markle, Ind., Jan. 21, 1874; d. Gary, March 11, 1938. Graduated from DePauw University in 1898, he was superintendent of schools at Bluffton, Ind. (1899-1907), and at Gary thereafter until his death. Wirt attracted national attention by splitting the student body of his schools into two "platoons" which alternated in the use of classroom facilities and recreational, shop, and laboratory facilities, increasing the efficient utilization of school plants. The system came to be known as the Gary plan or platoon plan. After 1914, Wirt helped to put the scheme into operation in the public school system of New York City, where it was branded by some politicians as undemocratic and was largely responsible for the defeat at the polls in 1918 of the city administration which had introduced it. The plan had considerable effect in increasing vocational and recreational components in school curricula throughout the United States. In 1929 a survey showed that 202 cities were using the platoon system, but by 1950 relatively few schools were continuing the program.

Corn—the state's leading crop—covers the hillsides surrounding a typical village in central Wisconsin.

State Seal of Wisconsin

WISCONSIN, wis-kon'son, one of the east north central states of the United States. It is bounded on the north by Lake Superior and Upper Michigan, on the east by Lake Michigan, and on the south by Illinois; on the west it is separated from Iowa and Minnesota by the Mississippi River and by one of its tributaries, the St. Croix. Wisconsin's greatest width is 295 miles (475 km), and its greatest length 320 miles (515 km). The name "Wisconsin" comes from an Indian word for the principal river of the region, spelled Miscoos, Miskonsing, Mesconsin, and finally Ouisconsin by the French. It is usually interpreted to mean "gathering of the waters."

Although known as "America's Dairyland," Wisconsin is also an important industrial state, ranking 11th in the nation in value of manufactures. The state is noted for its varied and beautiful scenery, the lakes and forest region in the north being a favorite vacationland. Socially and economically, Wisconsin derived much strength from Yankee immigrants and from members of the many European groups who came to the area in the 19th century. The state was among the first to experiment in agricultural,

educational, social, and economic affairs with the "Wisconsin Idea," a philosophy of government introduced early in the 20th century that set the national pattern for much progressive legislation.

The state is known as the Badger State because the early miners who came into the region lived in mine shafts or dug their homes out of the hillsides in much the same way that badgers do.

1. The Land

Almost half of the state is covered with forests, and 1,690 square miles (4,377 sq km) are inland water and lakes. The great number of lakes and the natural beauty attract large numbers of sportsmen for the fishing, hunting, and winter sports such as tobogganing, skiing, and ice boating. The state is well known for its dairy products, breweries, and paper industry.

Major Physical Divisions. Wisconsin is a shield-like plain, but its surface is not that of a smooth,

INFORMATION HIGHLIGHTS

Location: Wisconsin is an east north central state bounded on the north by Lake Superior and Upper Michigan, on the east by Lake Michigan, and on the south by Illinois; on the west it is separated from Iowa and Minnesota by the Mississippi River and one of its tributaries, the St. Croix.

Elevation: Highest point—Timms Hill, 1,952 feet (595 meters); lowest point—Lake Michigan, 581 feet (177 meters); approximate mean elevation—1,050 feet (314 meters).

Total Area (land and inland water): 56,153 square miles (145,436 sq km); rank, 26th.

Resident Population: 4,891,769 (1990 census). Increase (1980–1990), 4%.

Climate: Cool to cold winters, warm to hot summers, with sharp changes frequent; rainfall abundant, snow heavy in the north.

Statehood: May 29, 1848; order of admission, 30th.

Origin of Name: From the Indian name for the principal river of the region, spelled "Ouisconsin" by the French.

Capital: Madison.

Largest City: Milwaukee.

Number of Counties: 72.

Principal Products: Manufactures—engines, turbines, farm machinery, power cranes, machine tools, metalworking machinery, automobiles, truck and bus bodies, paper products; farm products—dairy products, corn, green peas, beets, cabbage, cranberries, snap beans, cattle, hogs, turkeys, milk; minerals—sand and gravel, granite, dolomite, zinc, clay, iron.

State Motto: "Forward."

State Song: On, Wisconsin.

State Nickname: Badger State.

State Bird: Robin.

State Flower: Wood violet.

State Tree: Sugar maple.

State Flag: The state coat of arms centered on a deep blue background. See also FLAG—Flags of the States.

mple plain. From the high land, about 1,650 feet (503 meters), in the north, it slopes gently downward all sides, reaching 500 to 600 feet (152–33 meters) above sea level at Lakes Superior and Michigan and at the Mississippi River. Glacial action and erosion have combined to give the state a varied and, in places, beautiful appearance.

The Northern Highland region covers the north-central section and is composed of rolling land and scattered glacial hills. Nestled between the Highland and Lake Superior is the narrow Superior Lowland, which formerly was a part of the lake bed and now is deeply eroded by the swift streams that flow across it. The curving, sandy Central Plain, 65 miles (105 km) wide at its broadest point (north of the city of Portage), bounds the Northern Highland on the south. The Eastern Ridges and Lowlands cover an area inland from Lake Michigan to the Central Plain and from Marinette county to the Illinois border. This region is characterized by old limestone escarpments along the western edge and glacial hills called drumlins, kettle moines, and terminal moraines. Most of the West-

Upland is covered by the Driftless Area, a region that in the glacial age was an untouched land in a sea of ice. Continuous stream erosion has crisscrossed the limestone strata with narrow ridges and deep, steep-sided valleys. The Drift-

Area, which contains some of the most beautiful scenery in Wisconsin, has been compared with the valley of the Rhine.

Rivers and Lakes. A low arch running north-south a little east of the center of Wisconsin separates streams running into Green Bay, Lake Michigan from those that flow into the Mississippi. About 30 miles (48 km) south of

Lake Superior, running east and west, is a minor divide from which several small streams flow north into Lake Superior. A low divide in Columbia and Fond du Lac counties separates the Fox and Rock river drainage basins.

Chief among the westerly flowing streams are the St. Croix, Chippewa, Black, and Wisconsin, all of which rise in the Northern Highland. The Menominee, Oconto, Wolf, and Fox flow into Green Bay. Near Portage the Fox and Wisconsin were connected in the 19th century by a canal that is no longer used. The Manitowoc, Sheboygan, and Milwaukee rivers flow directly into Lake Michigan.

Every region of Wisconsin except the Driftless Area contains lakes, of which more than 8,500 have been charted. Lake Winnebago is the largest, with an area of 215 square miles (557 sq km), although it averages only 15 feet (4.5 meters) in depth. The Four Lakes (Mendota, Monona, Waubesa, and Kegonsa) provide a striking natural setting for the state capital, Madison. Other important lakes are Geneva, Koshkonong, Muskego, Shawano, Beaver Dam, Poygan, and the Oconomowoc and Waupaca groups. In the Northern Highland are two concentrations of small lakes. One is in Vilas, Oneida, and Iron counties and the other is in Washburn, Burnett, and several neighboring counties. All of these are lakes of great beauty, set in the midst of forests of birch, poplar, maple, and pine; the water is clear and deep.

Wisconsin's long shoreline on Lake Michigan first witnessed the arrival of French explorers in the 1600's.

LINDA WELMER/UNIVERSITY OF WISCONSIN

WISCONSIN CONSERVATION DEPARTMENT

Wisconsin's more than 8,500 lakes are a result of glacial melting following the Ice Age.

Swampland is even more widespread in Wisconsin than lakes. Most of the swamps are in the northern lakes country, in the Central Plain, and in the Rock River valley. There are nearly 4,000 square miles (6,440 sq km) of undrained swamps and 7,000 square miles (11,265 sq km) of marshy and other poorly drained terrain.

Wisconsin has about 150 miles (240 km) of shoreline along Lake Superior and 380 miles (610 km) along Lake Michigan. The Bayfield Peninsula, Chequamegon Bay, and the Apostle Islands serve to break the Superior shoreline. Door Peninsula, Green Bay, Washington Island, and nearby small islands add variety to the Lake Michigan shoreline. While there are no natural harbors on Lake Michigan, excellent harbors have been created at river mouths to serve Milwaukee, Racine, Kenosha, Sheboygan, Manitowoc, Green Bay, and Marinette. On Lake Superior the harbors of Superior-Duluth, Ashland, and Port Wing are larger and better, being protected by sandspits that guard the inlets from wind and waves.

Climate. Wisconsin's climate is characterized by extremes of heat and cold and sharp changes caused by cyclonic storms that move across the region from west to east. Only the eastern edge of the state receives any benefit from the moderating influence of Lake Michigan. Extreme temperatures of 114° F and -54° F (46° C and -48° C) have been recorded, but the mean annual temperature ranges from 48° F (9° C) in the southwestern corner to 39° F (4° C) on the northern border. Temperatures below -20° F (-29° C) are infrequent, and summers, except for brief heat waves, are cool and pleasant.

The climate is ideal for agriculture. The state has as many as 170 growing days in the southeastern corner and an average of 120 or more days for all but the extreme Northern Highland, where the season may be as short as 75 days. Rainfall averages 27 to 34 inches (686-864 mm) per year, and 50% of it falls during the summer months. Snowfall averages 45 inches (1,143 mm) per year.

Plant and Animal Life. When the white man came to Wisconsin, most of the northern third of the state was covered with white pine. After the logging era ended, thousands of acres of pine were replanted in national, state, and county forests. Maple and oak are the most common trees in southern Wisconsin, but there also are great numbers of spruce, hemlock, cedar, birch, and elm. Huckleberries, Juneberries, raspberries, currants, blueberries, and other shrubs, as well as an endless variety of wild flowers, grow abundantly in many areas.

Each year many thousands of ducks, geese, and songbirds visit the state in the spring and fall. Wisconsin upland game birds include ring-necked pheasant, Hungarian partridge, quail, and sharp-tailed grouse. The Virginia white-tailed deer and the black bear are the only big game encountered in the state. Some wolves and wildcats can be found, and there are numerous small animals such as muskrat, beaver, raccoon, skunk, fox, woodchuck, and opossum. Wisconsin's lakes and streams are well stocked with trout, bass, pike, and muskellunge, and many smaller panfish. Lake trout, whitefish, herring, and perch are taken commercially from Lakes Superior and Michigan, and catfish and bass from the Mississippi.

Natural Resources. Water is one of the state's most beneficial resources. Lake Superior, Lake Michigan, and the Mississippi River provide an inexpensive form of transportation. The many inland lakes attract tourists, and rainfall is adequate enough to farm without irrigation.

Wisconsin's mineral output is limited, but the state does have deposits of iron ore, lead, and zinc. Sulfide deposits containing copper and zinc include those at Crandon, which constitute one of the largest supplies ever discovered in North America. Other minerals include basalt, clay, peat, quartzite, sandstone, limestone, and silica sand. Sand, gravel, and stone, including dolomite and granite, are also found in the state.

Forests cover almost half the land in Wisconsin, contributing to several of its important

OTHER FEATURES

MILWAUKEE JOURNAL PHOTO

milwaukee, Wisconsin's largest city, is an important lake port as well as a manufacturing and commercial center.

industries, such as the manufacture of plywood, veneer and pulp and paper. The hardwoods include ash, aspen, basswood, elm, maple, oak, yellow birch. The most abundant softwoods are balsam, fir, hemlock, pine, spruce, tamarack, and white cedar.

Among Wisconsin's valuable natural resources are its fish and wildlife. Game fish such as bass, muskellunge (the state fish), pickerel, pike, sturgeon and trout abound in the northern lakes and rivers. Game includes ducks, geese, partridges, quail, ruffed grouse, and woodcocks.

Conservation. Wisconsin has a well-developed conservation program. A state fish-stocking program each year provides millions of fish for lakes, rivers, and lakes. The state has established a bird refuge in Horicon Marsh and a bird and game farm at Poyntette. Hunting and fishing seasons as well as bag limits are rigidly enforced.

Since the rapid depletion of the huge stands of pine, forest conservation has been an important part of the state program. Over 4 million acres (3 million hectares) are contained in two national forests and in state, county, school, and community forests. About 3,000 miles (4,830 miles) of three-row tree shelter belt now checks erosion in six central counties.

The People

An important reform movement called Progressivism was started by Robert La Follette and people of Wisconsin in the 1900's. The state has been responsible for many reforms that were subsequently adopted by other states and the federal government. It was in Wisconsin where primary elections, regulation of public utilities, workmen's compensation laws, and workmen's compensation were first introduced. The state's educational contributions include the first schools for training rural schoolteachers; the first vocational training schools; the first correspondence courses, first at the University of Wisconsin; and the kindergarten. The Republican party had its beginnings in Wisconsin, and the first hydroelectric plant was installed in the state. Wisconsin was the first to use the numeral system for mark-

ing highways, and passed the first law requiring safety belts in all new cars sold in the state. Wisconsin was also the first state to end the death penalty.

Characteristics of the Population. The first important permanent settlements were made after the War of 1812, when lead miners from Southern states migrated to southwestern Wisconsin. Soon afterward migration from the Northeastern states began, and by 1850 (two years after Wisconsin's admission to the Union), 96% of the state's residents were of Yankee origin. The rush of European immigration in the next few decades changed the state's population rapidly. By 1870, 50% of the population was foreign born. By 1910 the percentage had dropped to 22.1%.

Most of the late 19th century immigrants came from Germany, and Milwaukee became the leading American center of German culture. Other ranking immigrant groups were Norwegian, Canadian, Austrian, Irish, and Swedish. Early in the 20th century there was an influx from eastern Europe, particularly from Poland, and by 1930 this group made up 10% of the total state population. Wisconsin has every important national group known, and they have made crucial contributions to the state's history and culture.

Wisconsin is an important agricultural state, but its population is largely urban. The population has become concentrated in the industrialized eastern and southeastern sections of the state.

Nearly 40,000 Native Americans live in Wisconsin, many of them on five reservations in the northern part of the state. The largest tribes are the Chippewa and Menominee.

Church membership in Wisconsin is about evenly divided between Roman Catholics and Protestants. The principal Protestant groups are Lutheran, United Church of Christ, United Methodist, and United Presbyterian.

The Wisconsin vote since the Civil War has been divided between the Democratic and Republican tickets with only a slight leaning toward the Republican. Third parties have done well in the state. The Socialist party dominated Milwaukee's politics from 1900 to 1940, and during the 1920's there were Socialist members in both houses of the legislature. The Progressives' Philip

Wisconsin's dairy farms produce more than 40% of all U.S. cheese and a high proportion of other milk products.

F. La Follette served two terms as governor in the 1930's.

Way of Life. With its neighbors, Wisconsin shares general Midwestern views and culture. The variety of ethnic groups that settled in the state (such as the Germans in Milwaukee, the

Poles in Stevens Point, and the Cornish in the lead region) lent national characteristics to certain communities and areas, though few of these persist. Wisconsin has long enjoyed a reputation for good government and progressive legislation.

Main Centers of Population. Wisconsin's largest city is Milwaukee, an important port on the Great Lakes and an industrial center. Noted for two outstanding universities and its breweries, the city has a European atmosphere and is one of the leading centers of German-American culture in the nation.

The second-largest city is Madison, the state capital, where the main campus of the University of Wisconsin is located. Other important manufacturing and shipping centers are Racine, Kenosha, West Allis, and Green Bay, home of the state's popular Green Bay Packers football team. Nearly two thirds of the state's population live in urban areas.

3. The Economy

From 1840 until after the Civil War, Wisconsin was a leading wheat-producing state. After about 1870 the state gradually turned to diversified farming and dairying. Manufacturing began in the villages along Lake Michigan in territorial times, and Milwaukee was long the leading flour-milling center of the West. Because of the ease of transportation along the Great Lakes, commerce has long been of importance to Wisconsin. The state has been able to bring in raw materials to build up a thriving metals industry, and it now ranks high in the production of machinery and electrical and transportation equipment. An abundant water supply has made possible the development of papermaking as a leading industry in the valleys of the Fox, Wisconsin, and Chippewa rivers.

Manufacturing. Milwaukee and the southeastern portion of the state are the most heavily industrialized. Wisconsin's leading manufactures are nonelectric machinery including engines, turbines, farm machinery, power cranes, machine tools, and metalworking machinery; food products; metal products such as hardware, cutlery, and cans; transportation equipment, including automobiles, truck and bus bodies,

ships, and boats; and paper products. Kenosha's automobile production is second only to Detroit's. The paper industry is centered in the cities along the Fox River and the Wisconsin River, including Green Bay, Rhinelander, Algoma, Marinette, Neenah, Oshkosh, Eau Claire, and Wausau. Other industries of importance are the manufacture of lumber and wood products, rubber and plastic products, electrical machinery, heating and plumbing equipment, leather and leather goods, and the brewing of beer, one of the state's oldest industries.

Agriculture. While the number of farms in Wisconsin has been declining since the 1920's, the size of the farms has become larger. The state has about 94,000 farms, averaging nearly 200 acres (81 hectares) in size. More than half of Wisconsin's farms specialize in dairying and

livestock. Along with the beef, hogs, and turkeys produced here, mink ranching is another important livestock industry.

The major field crop in Wisconsin is corn, raised mainly for livestock feed. The state ranks high in the production of green peas, beets, cabbage, corn, cranberries, and snap beans. Other

Abundant forests and hydroelectric power have contributed to the development of Wisconsin's paper industry.

crops are potatoes, hay, cherries, apples, strawberries, and lettuce.

Dairying. About 40% of the nation's cheese and 20% of its butter come from Wisconsin. Dairying is important but not the state's leading industry. Because of the value placed on its dairy products, the sale of margarine was prohibited in the state until the early 1960's. Other dairy products produced here are condensed milk, evaporated milk, dried milk, malted milk, and ice cream. Wisconsin has more cows producing more milk than any other state in the country. Dairy-processing plants are located throughout the state.

Mining. Sand and gravel are the most valuable minerals in Wisconsin, followed by granite, dolomite, zinc ore, and clay. Iron ore is mined mainly in Jackson county, but mining does not constitute a major industry in the state.

Transportation. The first railroad across the state was completed between Milwaukee and Prairie du Chien in 1857. About ten railroads provide freight service in the state, the most heavy use of which is in the industrialized southeastern part of the state. Railroad ferries cross Lake Michigan from several points along Wisconsin's shore, carrying passengers and automobiles.

Wisconsin has two important waterways for the transport of freight cargo. One is the Great Lakes-St. Lawrence Seaway System, linking the Midwest with the Atlantic Ocean, and the other is the Mississippi River. Milwaukee is a major Great Lakes port, but many oceangoing ships also dock at Green Bay, Kenosha, Manitowoc, Sheboygan, and Superior.

Wisconsin, the first state to adopt the number system for highway marking, has more than 100,000 miles (160,000 km) of roads. About 600 miles (965 km) are part of the interstate system, but even the secondary roads are well maintained in the prosperous farming regions.

Scheduled airline service was established in 1927. Wisconsin has about 300 airports.

4. Government

Constitution. The constitution of the state of Wisconsin was adopted in 1848, following the defeat by the voters of a constitution in 1846 that allowed married women to hold property in their own names, exempted 40-acre (16-hectare) homesteads from forced sale, and forbade banks of issue. The women's property rights and homestead exemption clauses later became law. The 1848 constitution has served Wisconsin throughout its history as a state. It has been amended to allow, among other things, the nonpartisan election of certain judicial and state officers, the direct primary, and a state income tax. To amend the constitution, two consecutive legislatures must concur on the amendment, which then must be approved by popular referendum.

Every citizen 18 years of age or over and of sound mind may vote in Wisconsin if he has been a resident of the state for six months and of his election district for ten days.

Judicial officers, members of county boards, and city and village officers are elected on nonpartisan tickets in April. Other state and county officers are elected in regular elections in November of even-numbered years. All party candidates are nominated in the September open primaries. Wisconsin has 11 electoral votes and nine representatives in the House of Representatives.

Anthony S. Earl (Dem.)	1983-1987
Tommy G. Thompson (Rep.)	1987-

Structure of Government. Executive power rests in a governor who, with the lieutenant governor, secretary of state, treasurer, attorney general, and state superintendent of public instruction, is elected every four years. There is no legal limit to the number of terms a governor may serve. With the expansion of state services in the 20th century, many administrative boards and agencies were created by law.

Wisconsin has a bicameral legislature. The 33 members of the Senate are elected to serve four-year terms. There are 99 assemblymen elected to two-year terms. The legislature meets regularly on the first Tuesday after January 15, and may be called in special session by the governor. The people of the state may legislate directly through the initiative and the referendum at the local level, and all elected officials are subject to recall by the district voters.

Wisconsin's judicial system is headed by a state supreme court of seven justices elected on a nonpartisan ballot for ten-year terms. The justice with the longest service in the court serves as chief justice. Other courts include appellate, circuit, and county courts. Judges in these courts are elected, also on a nonpartisan

GOVERNMENT HIGHLIGHTS

Electoral Vote—11. Representation in Congress—U. S. senators, 2; U. S. representatives, 9. State Legislature—Senate, 33 members, 4-year terms; Assembly, 99 members, 2-year terms. Governor—4-year term; may serve consecutive terms.

ballot, to six-year terms. The office of justice of the peace was abolished in 1966.

Public Finance. Individual and corporate income taxes produce almost 55% of all state-collected tax revenue. Motor-fuel taxes and licensing fees are used for highway construction and maintenance. Fees from hunting and fishing licenses are used for conservation programs. Other taxes include a general sales tax, inheritance and gift taxes, public-utility tax, general property tax, and a tax on cigarettes. Federal grants and programs provide another source of income for the state.

Social Services. Wisconsin operates Wisconsin General Hospital and the Diagnostic Center in Madison; three schools for retarded children, in Union Grove, Sparta, and Madison; a school for the deaf in Delavan; a number of county hospitals for the care of the mentally ill; and about 25 community mental-health clinics. The state penal system includes a state prison in Waupun, a prison for women in Taycheedah (Fond du Lac county), a reformatory in Green Bay, a school for boys near Wales, and a school for girls in Oregon.

5. Education and Culture

Elementary and Secondary Education. Wisconsin's first public elementary school was founded in Kenosha in 1845. Public high schools became common after 1875. Compulsory attendance between ages 7 and 14 was enacted after 1879, the upper age requirement being raised to 16 in 1949. In 1911 a system of part-time vocational education was established. The first kindergarten in the nation was opened in 1856 in Watertown by Mrs. Carl Schurz.

The office of state superintendent of public instruction was established by the constitution. Its control of public education is exercised mainly through the distribution of state aids, teacher certification, and enforcement of health, safety, and sanitation laws. The county superintendents of schools were replaced in 1964 by a state cooperative educational services committee. The committee was to plan for the establishment of area educational service agencies to handle the former superintendents' functions.

Higher Education. A state university was founded in Madison in 1849. The first of the state normal schools (now called state universities) opened in 1867 in Platteville. After that, eight more were established, and in 1955 the college in Milwaukee became the University of Wisconsin-Milwaukee. In 1911, Stout Institute for the training of industrial- and household-arts teachers was incorporated into the state system, and in 1955 the Platteville School of Mines became a state college. Twenty county colleges also train Wisconsin teachers.

Among Wisconsin's private colleges, Marquette University is the largest, and Carroll College at Waukesha is the oldest. Others include Lawrence University in Appleton, with its affiliated Conservatory of Music and Institute of Paper Chemistry; Ripon; Beloit; Carthage (in Kenosha); Milton College; and St. Norbert (in De Pere). Specialized schools include the Layton School of Art at Milwaukee and the Milwaukee School of Engineering.

Libraries and Museums. The State Law Library was founded in Madison in 1836. In 1895 a commission was established to develop library service throughout the state. The first legislative refer-

WOLLIN-FORRESTAL PHOTOGRAPHY

Wisconsin's State Capitol in Madison, built of white granite in 1917, is one of the most impressive in nation.

ence library in the nation was founded in Madison in 1901. There are two other outstanding libraries in Madison: that of the University of Wisconsin and that of the State Historical Society. The largest library in the state is the Public Library in Milwaukee.

The State Free Library Commission sends traveling libraries to all parts of the state, and the resources of the State Historical Society and University of Wisconsin libraries are available through interlibrary loan.

The Milwaukee Public Museum, operated by the city in connection with its public library, has a collection of prehistoric Indian tools, weapons, and other items. It is one of the nation's outstanding museums of natural science and history. The State Historical Society has a museum in addition to its library in Madison and also maintains the Stonefield Farm and Craft Museum in Baraboo.

Fine arts museums include the Wright Art Center at Beloit College, the Paine Art Center and Arboretum in Oshkosh, and the Milwaukee Art Center.

Museums of special interest include the Dard Hunter Paper Museum in Appleton, the Museum of Medical Progress in Prairie du Chien, and the Rhinelander Logging Museum, where the exhibits are housed in a replica of an old-time logging camp.

Historical Societies. Major work in state and local history is done by the State Historical Society and more than 90 local and county societies. The state society, founded in 1846, publishes books on Wisconsin, and the *Wisconsin Magazine of History*, a quarterly magazine for adults, as well as *Badger History*, a quarterly for elementary and high-school students. The society also maintains historic sites at Prairie du Chien, Greenbush, Cassville, and Baraboo.

Other Cultural Institutions. Much of Wisconsin's production in the arts has been of a regional nature. The Wisconsin Regional Writers' Asso-

© 1980, DENNIS CHURCH

The Madison Civic Center contains a spacious cultural complex with an art gallery and a theater.

ciation, founded in 1948, and the Wisconsin Idea Theatre, established in 1953, have had a steady growth in membership. The Wisconsin Rural Art group, organized in 1940, holds regional and state exhibitions each year. In 1957, Milwaukee completed a war memorial that houses a fine arts gallery, and the Layton School of Art in that city erected a new lakefront building in 1957 for exhibition purposes. Wisconsin-born Frank Lloyd Wright's buildings for the Johnson Wax Company in Racine are outstanding examples of contemporary architecture.

Communication. The first newspaper in Wisconsin was the weekly *Green Bay Intelligencer* founded in 1833. The *Milwaukee Sentinel*, founded as a weekly in 1837, is the oldest existing newspaper, and the *Milwaukee Journal* has the largest circulation.

The state's weekly newspapers are banded together through the Wisconsin Press Association, the oldest state press association in the United States, having existed since 1853. Until World War I, Wisconsin also had a significant foreign-language press.

The first radio station in Wisconsin, station 9XM from the University of Wisconsin, began broadcasting in 1919. The oldest commercial station, WIBA, was licensed in 1925. The state's first television station, WTMJ-TV, started broadcasting from Milwaukee in 1947. Wisconsin has about 20 television stations and 225 radio stations.

6. Recreation and Places of Interest

Resort and Other Recreational Areas. The southern Wisconsin resort area includes Lakes Delavan and Geneva and the Oconomowoc chain. In the east-central region, the areas around Lakes Winnebago and Poygan are important. In the northern section, the lakes region of Oneida, Vilas, and Iron counties and of the northwestern part of the state are the principal attractions.

The Dells region of the Wisconsin River is one of the most attractive recreation and resort areas in the state. Here the river, cutting a channel through the soft sandstone, has carved rock formations into unusual shapes having names

such as Grand Piano, Devil's Elbow, and Fat Man's Misery. The Upper Dells are separated from the Lower Dells by a dam, and may be seen from footpaths or on boat tours.

Among other areas of unusual scenic beauty are the Door County Peninsula and Rib Mountain, at Wausau, one of the highest points (1,940 feet, or 591 meters) in the state.

There are two national forests in northern Wisconsin, Chequamegon and Nicolet, both with extensive recreational areas. There are more than 260 lakes in Nicolet, and 170 in Chequamegon. Important state parks are Nelson Dewey near Cassville; Pattison State Park, where Big Manitou Falls is located; Potawatomi on Sturgeon Bay; Wyalusing near Prairie du Chien; Peninsula State Park, one of the largest in the state, near Green Bay; Interstate Park at St. Croix Falls; Devils Lake State Park at Baraboo; Terry Andrae at Sheboygan, with its wide sandy beach on Lake Michigan; and Point Beach on Lake Michigan at Two Rivers.

Other pleasurable recreation areas are Apostle Islands National Lakeshore on Lake Superior; Ridges Sanctuary for the protection of the environment at Bailey's Harbor; Black River State Forest; Blue Mound State Park and Cave of the Mounds at Blue Mounds; Aqualand and Wildlife at Boulder Junction; Door County Peninsula; MacKenzie Environmental Center at Poynette; and at West Bend, Lizard Mound State Park, containing 31 Indian effigy mounds.

Historic Sites and Monuments. Historic sites include Old Wade House in Greenbush; Villa Louis in Prairie du Chien; Stonefield Farm and Craft Museum in Cassville; the nation's first kindergarten in Watertown; Fort Howard, Cotton House, and Tank Cottage in Green Bay; and Old Indian Agency House and Fort Winnebago Surgeon's Quarters in Portage. Other sites include Old World Wisconsin near Eagle, which consists of houses and other structures built by Wisconsin immigrants in the 1800's; First Capitol State Park near Belmont; and the schoolhouse in Ripon where the first meeting was held that gave birth to the Republican party in 1854.

Other Places of Interest. Places of interest in Wisconsin include House on a Rock near Dodgeville, which sits on top of a huge rock and features six fireplaces, seven pools, and many antiques; Little Norway near Mount Horeb, a village resembling one in Norway, with interesting Scandinavian-style houses and furnishings; Frank Lloyd Wright's home *Taliesin* and his architectural school at Spring Green; Octagon House at Watertown; Badger Mine and Museum at Shullsburg; Pendarvis in Mineral Point, a group of carefully restored Cornish homes; the National Bowling Hall of Fame and Museum in Milwaukee and the Green Bay Packers Hall of Fame containing the football team's trophies and mementos in Green Bay; Lac du Flambeau in the center of the 144-square mile (372-sq km) Chippewa Indian Reservation; Ozaukee County Pioneer Village at Cedarburg; and Granddaddy Bluff, towering over the city of La Crosse and offering a view of Wisconsin, Iowa, and Minnesota. Many of the lakes, including Michigan and Superior, have excursion boats. Municipal parks and zoos are found in the larger cities.

Annual Events. Many annual events take place during the winter, when ice and snow sports are at a peak. These include the three-day Snowmobile Derby at Eagle River, the Silver Skates

Racing Derby at Beloit, a ski-jumping tournament at Westby, and an Ice Fishing Jamboree at Presque Isle. Spring brings the Danish Kringle Fest to Racine in May, and the Syttende Mai Norwegian Festival to Stoughton and Westby. In the month of June there is the crowning of "Alice in Dairyland," which is held in a different Wisconsin city each year; the Fyr Bal Fest and Regatta at Ephraim; and the Heidi Festival in New Glarus.

Summer events include the Holland Festival in Cedar Grove, the Lumberjack World Championship in Hayward, the Volksfest and the Wilhelm Tell Pageant in New Glarus on Labor Day weekend, the cherry harvest in Door county, and the Musky Jamboree in Boulder Junction. Both the Wisconsin State Fair in Milwaukee and the Peninsula Music Festival at Fish Creek are held in August.

Indian events on the calendar include Chippewa powwows that take place twice weekly during the summer at Lac du Flambeau, and the

MILWAUKEE SENTINEL PHOTO

Favorite activities in Wisconsin include cross-country skiing, a sport that attracts many winter enthusiasts.

FAMOUS WISCONSINITES

Allis, Edward Phelps (1824-1889), industrial pioneer.
 Babcock, Stephen Moulton (1843-1931), agricultural chemist.
 Bardeen, John (1908-), physicist, winner of the 1956 Nobel Prize in physics.
 Derleth, August William (1909-1971), author.
 Dodge, Henry (1782-1867), soldier and statesman who fought in the Black Hawk War of 1832 and became the first governor of the Territory of Wisconsin.
 Ferber, Edna (1887-1968), novelist, short-story writer, and playwright.
 Gale, Zona (1874-1938), novelist who won the Pulitzer Prize for her play *Miss Lulu Bett* in 1921.
 Houdini (1874-1926), magician and escape artist.
 Kohler, Walter Jodok, Sr. (1875-1940), manufacturer and politician, planned and built model garden community. Governor, 1929-1931.
 La Follette, Philip Fox (1897-1965), political leader, son of Robert M. La Follette, governor in 1931-1933 and 1935-1939; with his brother Robert M. La Follette, Jr., organizer of the Progressive Party in Wisconsin.
 La Follette, Robert Marion (1855-1925), distinguished political figure, Progressive Republican governor, U. S. senator, and Independent presidential candidate in 1924.
 La Follette, Robert Marion, Jr. (1895-1953), political leader elected to U. S. Senate to fill vacancy left by his father's death.
 Leonard, William Ellery (1876-1944), poet.
 Lunt, Alfred (1893-1977), actor.
 MacArthur, Douglas (1880-1964), World War II military leader.
 McCarthy, Joseph Raymond (1908-1957), U. S. senator.
 Maers, Helen Farnsworth (1876-1916), sculptor.
 Mitscher, Marc A. (1887-1947), commander of the carrier *Hornet* in World War II.
 Murphy, William Perry (1892-), Wisconsin-born physician and Nobel Prize winner.
 Nieman, Lucius William (1857-1935), newspaperman who established the *Milwaukee Journal* in 1882.
 Peck, George W. (1840-1916), governor and literary figure who wrote the *Peck's Bad Boy* series.
 Schorer, Mark (1908-1977), novelist, biographer, and critic.
 Schurz, Carl (1829-1906), political leader.
 Sholes, Christopher L. (1819-1890), journalist and inventor of the typewriter.
 Turner, Frederick J. (1861-1932), historian who won a Pulitzer Prize in history in 1933.
 Twining, Nathan F. (1897-1982), Air Force general.
 Van Hise, Charles Richard (1857-1918), geologist and president of University of Wisconsin 1879-1903.
 Wilcox, Ella Wheeler (1850-1919), poet.
 Wright, Frank Lloyd (1869-1959), foremost American architect.

Menominee Indian Pageant in Shawano in August. The World Dairy Exposition is held in Madison in October and the Holiday Folk Fair in Milwaukee in November.

7. History

Glaciation, or the lack of it, is responsible for Wisconsin's unusual topography. The ice scraped and carved the state's many lakes and left behind a valuable accumulation of glacial phenomena. About 1,500 years ago the area was inhabited by prehistoric Mound Builders who built burial mounds in the areas of Neenah and Baraboo. When the first explorers arrived, the chief tribes in the area were Menominee, Winnebago, Iowa, and Dakota.

Exploration. Frenchman Jean Nicolet made the first recorded visit to Wisconsin by a white man, landing at Green Bay in 1634 to cement trade relations between the Indians and the French. During the next 130 years the region was explored by Pierre Esprit Radisson and Medart Chouart de Groseilliers, Louis Jolliet (or Joliet), Jacques Marquette, Daniel Greysolon Duluth, Nicolas Perrot, and others. Jesuit missionaries labored from 1660 to Christianize the Winnebago, Chippewa, Menominee, Fox, Sauk, Potawatomi, and other tribes, but with little success. Posts at La Baye (later Green Bay) and La Pointe and on the Mississippi River conducted trade by which the countryside was practically denuded of beaver.

In 1763 control passed to the English, but the fur trade continued in the hands of French residents such as Charles de Langlade. Nominally, the United States gained control of the region in 1783, but the British did not withdraw until after the War of 1812. Occupation by the United States then became a fact with the erection in 1816 of Fort Howard at Green Bay and Fort Crawford at Prairie du Chien.

Settlement. After 1783 the Wisconsin region was successively part of the Northwest Territory (1783-1800) and the territories of Indiana (1800-1809), Illinois (1809-1818), and Michigan (1818-1836). Exploitation of the southwestern lead deposits began after 1822, and in 1827,

Indian title to the lead region was extinguished. At first many miners returned south each fall because of the severe winters (and were called "suckers," after the Mississippi River fish with similar migratory habits); others dug caves in the hillsides and there spent the winter months. These latter were jestingly called "badgers," and thus originated the popular nickname of the state and its people.

Indian treaties between 1829 and 1833 gave the whites all of present-day Wisconsin south of the Wisconsin River and east of the Fox. The last Indian stand against the whites in Wisconsin was the Black Hawk War in 1832. A land office opened in Mineral Point in 1834. When the Territory of Wisconsin was formed on July 3, 1836, there were within the boundaries of the present state about 12,000 inhabitants, most of whom lived in the lead region.

The territorial government formed at Belmont in the fall of 1836. Madison was chosen to be the permanent capital, and building began there in the winter of 1836-1837. Settlement of the southern third of Wisconsin progressed rapidly, and on May 29, 1848, the state constitution was approved and statehood was achieved.

Transportation posed an important problem for settlers of the new commonwealth. Steamboats and sailing vessels on the Mississippi and Great Lakes did little for the rich agricultural regions of the interior. Canals were projected but came to nothing. Plank roads were built in some places but proved only temporary expedients for transporting the growing flood of wheat to market. Railroads were the only solution, and the first line, between Milwaukee and Waukesha, was opened in February 1851 and extended to Prairie du Chien by 1857.

The Democratic party dominated the territorial and early state governments. The Republican party was officially formed in the state on July 1854 and won control of the state government in 1856. Except for three short intervals it remained the dominant party for more than 100 years.

Wisconsin contributed 91,379 soldiers to the Union armies during the Civil War and produced about 100 million bushels of wheat for the Northern forces. After the war the timber resources were thoroughly exploited, lumber production reaching a peak shortly before 1900. Wheat production fell sharply after 1870, and dairy farming was introduced and firmly established. Iron mining on the Gogebic Range in the north brought a flurry of speculative development in the 1880's.

Modern Era. Economically, the years after 1900 were marked by the emergence of the modern industrial and dairying state. With the end of the virgin forests, industry advanced to specialized fabrication of goods for a worldwide market, and Wisconsin took and maintained the national lead in dairying. Labor, whose principal organization in 1893 became the state federation of labor, began to gain in membership and power after the turn of the century.

Politically, the years after 1900 were marked by the triumph of the Progressive wing of the Republican party, led by Robert M. La Follette, who was governor in 1901-1906. Progressive measures such as the direct primary, ad valorem railroad taxation, workmen's compensation, and an industrial commission were passed under La Follette and his immediate successors. Stalwart

Republicans returned to power in 1915 and guided Wisconsin through World War I, when the state's industries produced ordnance, ships, and other manufactures for the war effort. Many of the 118,000 Wisconsin men who entered the armed forces served in the famous 32d Division.

From 1921 to 1939, save for two short periods, Wisconsin was again under Progressive domination. During the 1920's, to aid farmers, a department of markets was created and the campaign against bovine tuberculosis was pushed vigorously. Greater home rule was extended to cities, and the recall of public officials was provided for by constitutional amendment. Wisconsin progressivism found national expression in the 1924 presidential campaign of Sen. Robert M. La Follette, who, as an Independent candidate, received the support of 4.8 million voters.

In 1930 a La Follette son, Philip, became governor at age 33. He lost to a Democratic landslide in 1932 but was reelected in 1934 and 1936. He and his followers seceded from the Republican party in 1934 to form the Progressive party. During the 1930's, Wisconsin legislation improved the status of labor with the "Little Wagner Act" and the nation's first unemployment compensation law, and assisted farmers with measures for farm debt relief. The Wisconsin Agricultural Authority and the Wisconsin Development Authority were established. Republicans regained state offices in 1938 and were still holding them 20 years later, governors during this period being of the conservative mold.

During World War II, Wisconsin war plants turned out over \$12 billion worth of war matériel, and Wisconsin farmers produced record quantities of dairy products, fruits, vegetables, eggs, and poultry, in spite of the absence of over 300,000 young men and women who had entered the armed services. Another 132,000 served in the armed forces during the Korean conflict.

HISTORICAL HIGHLIGHTS

- 1634 The first of the French explorers, Jean Nicolet, landed on the Green Bay shore.
- 1673 Louis Joliet and Father Jacques Marquette discovered the Upper Mississippi.
- 1689 Nicolas Perrot claimed the region for France.
- 1701 First permanent settlement was established at Green Bay.
- 1763 England received the Wisconsin region from France after the French and Indian War.
- 1783 Wisconsin became part of the United States.
- 1832 Indian resistance ended in Wisconsin with the Black Hawk War.
- 1836 Congress created the Territory of Wisconsin.
- 1848 Wisconsin became the 30th state on May 29.
- 1851 Railroad track completed between Milwaukee and Waukesha.
- 1854 The Republican Party was founded at Ripon.
- 1872 The Wisconsin Dairymen's Association was organized by William D. Hoard and others.
- 1901 Robert M. La Follette, Sr., became governor, and the Progressive era began.
- 1903 The Wisconsin legislature passed the first law establishing primary elections.
- 1911 State legislature passed progressive legislation, including teachers' pensions and a commission to settle labor disputes.
- 1924 Senator Robert M. La Follette ran for U. S. president but was defeated.
- 1932 Wisconsin passed the first state unemployment compensation act.
- 1959 The St. Lawrence Seaway was opened.
- 1964 Wisconsin became the first state to have its legislative districts reapportioned by order of its supreme court.
- 1971 All state universities were united in a University of Wisconsin system.

The 1950's brought many difficult problems, such as a rapid rise in school population at all levels, increased auto traffic, the need for urban improvement, and a constant demand for greater revenue to pay the bills. It also brought television and the Milwaukee Braves baseball team, the 1957 world champions, and was marked by the rise to prominence of one of the most controversial figures in the state's political history, Sen. Joseph Raymond McCarthy. Wisconsin shared in the nationwide prosperity of the 1950's and experienced a boom in building, industry, and farm production, though farmers did not escape the cost-price squeeze that generally affected the agricultural segment of the nation's economy. Democrats put an end to the long period of Republican rule in the state house, electing Gaylord A. Nelson to the governorship in 1958 and reelecting him in 1960. Nelson was succeeded by another Democrat, John W. Reynolds, after the election of 1962. From the 1960's into the 1980's the Democrats alternated more or less regularly with the Republicans in the governor's office.

In the 1960's the St. Lawrence Seaway was bringing oceangoing cargo vessels to Wisconsin ports. Sports fans were cheering the success of the state's professional football team, the Green Bay Packers, but regretting the loss of the Milwaukee Braves baseball team to Atlanta, Ga. In 1970, however, Milwaukee got a new baseball team, the Brewers, formerly the Seattle Pilots. In government, the legislature approved a major reorganization of state agencies, a strong program to control water pollution, and revision of the state's primary system.

WISCONSIN, University of, a coeducational institution of higher learning, controlled by the state of Wisconsin. The University of Wisconsin consists of 13 branches: Eau Claire, Green Bay, La Crosse, Madison, Milwaukee, Oshkosh, Parkside (at Kenosha), Platteville, River Falls, Stevens Point, Stout (at Menomonie), Superior, and Whitewater. All the branches grant bachelor's and master's degrees. The University of Wisconsin-Madison and the University of Wisconsin-Milwaukee also grant doctorates.

In addition to its degree-granting institutions, the University of Wisconsin includes the University of Wisconsin Center System, a complex of two-year lower-division units. These are located in Baraboo, Barron county, Fond du Lac, Fox Valley, Manitowoc, Marathon county, Marinette, Marshfield, Medford, Richland, Rock county, Sheboygan, Washington, and Waukesha. Center-system course credits leading to a degree may be transferred to any of the degree-granting branches of the university. Instruction also is offered through the University of Wisconsin extension program, provided at the branches of the university as well as at the various center-system campuses.

The University of Wisconsin system was created in 1971, when the University of Wisconsin in Madison was merged with state universities. The total enrollment of the system is about 150,000, of which some 8,700 are in the center system and extension program.

The University of Wisconsin-Madison is the oldest branch of the university. It was founded in 1848 as the University of Wisconsin. Instruction began in 1849, and its first baccalaureate was given in 1854. The central administrative offices of the entire university and of the center system are located here.

The Madison branch comprises the colleges of letters and science, agricultural and life sciences, and engineering and the schools of business, education, nursing, pharmacy, law, and medicine. Full-time enrollment is about 32,000 students.

The University of Wisconsin-Eau Claire was established as a normal school, with first instruction in 1916. It became a teachers college, granting baccalaureates, in 1927; a state college in 1951; and a state university in 1964. Full-time enrollment is about 9,000.

The University of Wisconsin-Green Bay was established in 1969. Full-time enrollment is about 2,200.

The University of Wisconsin-La Crosse was first a state normal school (1909) and later a state teachers college (1926), a state college (1951), and a state university (1964). Full-time enrollment is about 7,000.

The University of Wisconsin-Milwaukee, with a full-time enrollment of some 13,000, is the second largest of the university branches, after Madison. Established in 1955 by the merger of a state college and a university extension division, it offers instruction in schools of architecture, business administration, education, fine arts, nursing, social welfare, and library and information science and in colleges of letters and sciences and of engineering and applied science.

The University of Wisconsin-Oshkosh was established as a normal school (1871) and became a teachers college (1925), a state college (1949), and a state university (1964). It comprises the schools of letters and sciences, business, educa-

tion, and nursing, and a graduate school. Full-time enrollment is about 7,000.

The University of Wisconsin-Parkside was established in 1965. Full-time enrollment is about 2,500.

The University of Wisconsin-Platteville was chartered as a normal school in 1866 and became a teachers college in 1927 and a state college in 1951. In 1959 it merged with the Wisconsin Institute for Technology (established 1907) as the Wisconsin State College and Institute of Technology, after which, in 1964, it became a state university. Full-time enrollment is about 4,000.

The University of Wisconsin-River Falls was chartered as a normal school (1874) and became a teachers college (1926), a state college (1951), and a state university (1964). It offers courses in colleges of arts and sciences, agriculture, and education. Full-time enrollment is approximately 4,000.

The University of Wisconsin-Stevens Point was established as a normal school in 1894. It became the Central State Teachers College in 1926, Wisconsin State College in 1951, and Wisconsin State University-Stevens Point in 1963. Its components are the colleges of letters and science, fine arts, natural resources, and professional studies. Full-time enrollment is about 7,000.

The University of Wisconsin-Stout was established as the Stout Manual Training and Domestic Science School in 1891 and incorporated as the Stout Institute in 1908. It became a state college in 1955 and a state university in 1964. Full-time enrollment is about 5,500.

The University of Wisconsin-Superior was a normal school (1893), teachers college (1925), state college (1952), and state university (1964). Full-time enrollment is about 2,000.

The University of Wisconsin-Whitewater, with colleges of letters and sciences, arts, business and economics, and education and a school of graduate studies, was established as a normal school in 1868. It became a teachers college in 1925, a state college in 1951, and a state university in 1964. It comprises the colleges of letters and science, arts, business and economics, and education. Full-time enrollment is approximately 7,000.

WISCONSIN RIVER, a river in Wisconsin, originating in Lac Vieux Desert on the Wisconsin-Michigan border. The river bisects the state, following a generally southerly course to Portage, the head of navigation, and then flowing southwestward to a point about 3 miles (5 km) below Prairie du Chien, where it enters the Mississippi River. Shifting sandbars are encountered in some parts of the river, which is navigable for about one third of its 625-mile (1,006-km) length. It was once an important artery of commerce. There are several dams and hydroelectric installations along its course. Among its many waterfalls are the Dells of Wisconsin and Grandfather Bull Falls. A canal at Portage, joining the Wisconsin with the Fox River, is no longer in use. The river is lined at several points with bluffs rising to 400 feet (122 meters).

WISDOM LITERATURE. See *BIBLE—Growth of the Old Testament Literature* (Types of Literature in the Old Testament); *WISDOM OF SOLOMON, THE*.

WISDOM OF SOLOMON, THE (in Douay Bible, *BOOK OF WISDOM*), a book regarded by Protestants and Jews as apocryphal, but accepted by Roman Catholics as part of the Old Testament canon by virtue of its inclusion in the Latin Vulgate and its recognition by the Council of Trent (1545–1563). It purports to be the work of Solomon, the author referring to himself as a king, son of a king, judge, builder of the Temple, and recipient of wisdom and wealth from God, but its apparent use of certain Old Testament books in Greek, the presence of Greek thought and late Jewish elements, and the historical situation reflected in it lead to the supposition that it was composed in Greek by an Alexandrian Jew about a century before Christ. Its general purpose appears to be to encourage Jews to be true to their faith in a hostile environment in which temptations to idolatry and skeptical materialism are strong. In its poetic style and in content it has much in common with other "wisdom" literature, such as Proverbs, Job, Sirach (Ecclesiasticus), and certain of the Psalms.

The book falls into three main sections: (1) the diverse destinies of the godly and the ungodly (1 to 6:8), the former of whom may expect rewards and immortality, consisting of deliverance of the soul from the body, while the latter may expect punishment and extinction; (2) the praise of wisdom (6:9 to 9), co-worker with God and a divine gift and guide to the righteous; and (3) wisdom at work in Israelite history (10 to 19), a guide to the nation's leaders. Included in the last is an expansive account of the Exodus (16 to 19) and a long digression on the folly of idolatry (15 to 16), which leads to all kinds of evils.

While the writing doubtless exerted an influence in certain Jewish circles (an elaboration of similar viewpoints is found in Philo of Alexandria), its main usage was among early Christians, of whose Greek Bible it was a part. Affinities are found in the Pauline writings, in the Gospel of John, and in the Epistles to the Hebrews and of James. Many Christian writers knew and used it. It ranks as one of the most attractive and influential apocryphal books.

ALLEN WIKGREN, *The University of Chicago*

WISE, Henry Alexander (1806–1876), American political leader. He was born in Drummondtown, Va., on Dec. 3, 1806, and died in Richmond, Va., on Sept. 12, 1876. He graduated from Washington (now Washington and Jefferson) College in Pennsylvania in 1825, was admitted to the bar in 1828, and from 1830 practiced in Accomack county. In 1832 he was elected to Congress as a Jacksonian Democrat and remained in the House until 1844. He soon split with Andrew Jackson on the Bank of the United States issue, however, and from 1836 to 1840 ran as a Whig. Wise helped to secure the Whig vice presidential nomination for John Tyler in 1840, and when Tyler became president, Wise remained his close adviser. In 1844, Tyler named him minister to Brazil, where he served for three years.

An ardent defender of slavery and states' rights, Wise had meanwhile returned to the Democratic fold, and in 1855 he was elected governor of Virginia in a heated campaign against the Know-Nothing Party. He remained in office until 1860 and signed the death warrant of the abolitionist John Brown in 1859. In 1861 he at first advocated that Virginia remain in the Union but soon acceded to the prevailing secessionist sentiment

and became a strong supporter of the Confederacy. Although without military experience, he volunteered for service in the Confederate Army and in May 1861 was made a brigadier general. He was active in recruiting in western Virginia and also served on Roanoke Island, N.C., where one of his sons was killed. After further active service in South Carolina and Virginia, he was promoted major general three days before Robert E. Lee's surrender in 1865. At the end of the war he retired to private law practice in Richmond. He published *Seven Decades of the Union* (1872), a work dealing mainly with the life and administration of President Tyler. Hot tempered and vehement in speech, a highly effective campaigner and orator, he was one of the most colorful political leaders of the Old South.

WISE, Isaac Mayer (original surname WEIS), Bohemian-American rabbi, founder of Reform Judaism in the United States: b. Steingrub, Bohemia, March 29, 1819; d. Cincinnati, Ohio, March 26, 1900. He went to the United States in 1846 and served as rabbi first in Albany, N.Y., and then (from 1854) in Cincinnati, Ohio. There he began to make changes in the synagogue services, introducing organ music and prayers in English, and developing his congregation into a leading Reform temple. In 1854, also, he founded and became editor of the English-Jewish weekly, the *Israelite* (later *American Israelite*), which he soon supplemented with the German-Jewish weekly *Die Deborah*. Wise's ideal was to unite in Reform Judaism the best of the Jewish tradition with the best of modern Western culture. In 1855 he attempted to found a Reform Jewish rabbinical seminary, which did not succeed; in the same year he called a conference of rabbis in Cleveland to organize the Reform congregations of the United States into a countrywide movement; and in 1857 he published a Reform Jewish prayer book, *Minhag America*, in English and German editions.

In two subsequent conferences (1869 and 1871) Wise began to plan, and in 1873 succeeded in organizing, the Union of American Hebrew Congregations, which has continued ever since as the only organization of Reform Jewish communities in the United States. Wise succeeded in realizing his earlier plan, also, by founding (1875) in Cincinnati the Hebrew Union College, the Reform Jewish rabbinical seminary of the United States, of which he was the first president. His last great organizational achievement was the establishment (1889) of the Central Conference of American Rabbis, uniting all the Reform rabbis in the country. His *Selected Writings* (1900) and *Reminiscences* (1901) were edited by David Philipson.

RAPHAEL PATAI,

Director of Research, Theodor Herzl Institute,
New York City.

WISE, John, American aeronaut: b. Lancaster, Pa., Feb. 24, 1808; d. probably in Lake Michigan, Sept. 29, 1879. He made his first ascent in a balloon of his own design in Philadelphia, Pa., on May 2, 1835. More interested in the scientific aspects of balloon flight than in adventure or excitement, he made aeronautical and meteorological observations that proved of great value. In 1859 he carried mail by air for the first time in a flight from St. Louis, Mo., to Henderson, N.Y. (the destination had been New York City), with

three passengers. Wise volunteered in the Civil War but resigned from the Army after several disastrous flights. After he failed to get money for the purpose from Congress, the *New York Daily Illustrated Graphic* agreed in 1873 to finance construction of a large balloon to fly the Atlantic, but Wise withdrew from the flight after disagreement with the backers. On Sept. 28, 1879, at the age of 71, accompanied by a passenger, he ascended from St. Louis in the *Pathfinder*, intending to remain aloft as long as the gas lasted. The balloon was last seen the following day a few miles south of Lake Michigan and it is presumed that the balloon fell into the lake and that Wise perished there. Wise's body was never found. During his career he made 462 ascents. He published *A System of Aeronautics* (1850) and *Through the Air* (1873).

ELIZABETH B. BROWN.

WISE, John, American Congregational clergyman: b. Roxbury, Mass., bap. Aug. 15, 1652; d. Ipswich, April 8, 1725. He graduated from Harvard College (1673) and in 1680 accepted a call to the Chebacco Church in Ipswich, where he remained until his death. A militant champion of the rights of the colonists, he was deprived of his ministry for a short time in 1687 for leading the town in revolt against a tax imposed by Gov. Edmund Andros. In 1689 he represented Ipswich at the convention in Boston to reorganize the colonial government and in the same year was chaplain of the unsuccessful expedition against Quebec.

Wise's ideas of democracy in church and state had considerable influence on the political theorists of the Revolutionary period. In November 1705 Increase Mather published a pamphlet proposing a presbyterian form of government for the New England churches, which Wise opposed. His answer, *The Churches Quarrel Espoused* (1710), was largely instrumental in defeating the project. In 1717 he wrote *A Vindication of the Government of New-England Churches*, detailing his ideas about civil and ecclesiastical government, several passages of which are paraphrased in the Declaration of Independence. The two pamphlets, reprinted in 1772 and again in 1860, are remarkable for their brilliance of style as well as their democratic spirit.

WISE, Stephen Samuel, American rabbi and Zionist leader: b. Budapest, Hungary, March 17, 1874; d. New York, N.Y., April 19, 1949. The son of a rabbi, Aaron Wise (originally Weiss), he was taken to the United States as a child of one, studied at Columbia University (B.A., 1892; Ph.D., 1901), and received private training in rabbinics. From 1893 to 1900 he served as rabbi at the Madison Avenue Synagogue in New York City and then at a synagogue in Portland, Ore. In 1906 he was invited to the pulpit of Temple Emanu-El in New York City, the most influential Reform congregation in the United States; but, unable to accept any limitation on his freedom of utterance, he founded instead (1907) the Free Synagogue of New York, of which he remained rabbi until his death. Wise's oratorical brilliance and dynamic personality attracted large audiences to his sermons, which he frequently preached at Carnegie Hall on Sunday mornings. Generally these sermons were devoted to discussions of timely problems of American and Jewish life.

An outstanding Zionist leader from his early years, Wise was one of the founders (1898) of the Federation of American Zionists (later renamed the Zionist Organization of America), served as its president (1936-1938), and influenced many social and political leaders, among them President Woodrow Wilson, toward a sympathetic understanding of Zionism. He also took a deep interest in the social issues of his day, attacking injustices in the steel industry, championing a shorter factory work week for women, and fighting exploitation in the needle trades. His devotion to democratic ideals and practices induced him to found (1917) the American Jewish Congress, which he represented at the Versailles Peace Conference and served as president (1925-1929, 1935-1949). He also established (1922), in New York City, the Jewish Institute of Religion (united with the Hebrew Union College in 1950) for the non-sectarian and liberal training of rabbis. Recognizing the need for a united, worldwide organization to represent Jewish rights and interests, Wise founded the World Jewish Congress (1936), served as its president for the rest of his life, and as such became a world leader in the fight against Hitlerism. He was the author of *The Improvement of the Moral Qualities* (1902); *How to Face Life* (1917); *Child Versus Parent* (1922); *The Great Betrayal*, with Jacob De Haas (1930), on Britain's role in mandatory Palestine; and the autobiography *Challenging Years* (1949). In addition, a collection of his sermons were published in a 10-volume series, *The Free Synagogue Pulpit*.

RAPHAEL PATAI,

Director of Research, Theodor Herzl Institute,
New York City.

WISE, Thomas James, English bibliographer, book collector, and forger: b. Gravesend, England, Oct. 7, 1859; d. London, May 13, 1937. While employed by a London firm of essential oil merchants, of which he eventually became a partner, he began to collect and deal in manuscripts, books, and pamphlets by English writers. In 1912 he retired from business, and thereafter devoted his entire time to collecting books and making bibliographies. He published catalogues and bibliographies of Percy Bysshe Shelley, Alfred Tennyson, Algernon Swinburne, Samuel Taylor Coleridge, William Wordsworth, Robert Browning, Charlotte and Emily Brontë, Joseph Conrad, and many other outstanding writers. His own collection of rare editions, an unusually valuable one known as the Ashley Library, was acquired by the British Museum after his death in 1937. Some three years earlier, however, John Carter and Graham Pollard had published *An Enquiry into the Nature of Certain Nineteenth Century Pamphlets*, which proved that some of the works which Wise had sold to other collectors were forgeries; in later years, as other books he had handled were put on the market, other forgeries were uncovered. In the perpetration of these frauds, Wise seems to have been motivated chiefly by a desire for money. He used these funds to purchase books and manuscripts with which to improve his own library.

WISE MEN FROM THE EAST, in New Testament history, the three Magi (q.v.) who, according to the Gospel of Matthew (2:1-12), followed the guiding star to Bethlehem to render homage to

the newborn King of the Jews, bringing him gold, frankincense, and myrrh. A legend, which can be traced back to the 2d century, calls them kings, and later times distinguished them as Melchior, Caspar or Caspar, and Balthasar. They are honored at the Feast of the Epiphany. Empress Helena is said to have taken their bones to Constantinople, whence they were transported to Milan, and, eventually, to the cathedral at Cologne. They are sometimes referred to as the Three Kings of Cologne. In paintings representing the Adoration of the Magi, the youngest of the kings is usually portrayed as a Moor.

WISEMAN, wīz'mən, **Nicholas Patrick Stephen**, English Roman Catholic prelate: b. Seville, Spain, of Anglo-Irish parentage, Aug. 2, 1802; d. London, England, Feb. 15, 1865. While attending St. Cuthbert's College at Ushaw, near Durham (1810-1818), he decided to become a priest, and in 1818 went to Rome to study at the recently revived English College. There he specialized in Oriental languages, although he also attained distinction in natural sciences and dogmatic and scholastic theology, receiving his doctorate in divinity in 1824. The following year he was ordained a priest, and in 1828 he was appointed professor of Hebrew and Syro-Chaldaic at the University of Rome. In the same year, the publication of his *Horae Syriacae*, interpreting Syrian texts, firmly established his reputation as a scholar.

From 1828 to 1840 Wiseman served as rector of the English College. A man of wide learning and a gifted speaker, he soon began to devote his energies to a revival of Catholicism in England, and found a wide audience for the lectures he delivered there in 1835-1836 (published in 1836 as *Lectures on the Roman Catholic Church*). In 1836, with Daniel O'Connell and Michael Quin, he founded the *Dublin Review*. Consecrated titular bishop of Melipotamus in 1840, he was assigned to the Central District of England; in 1849 he became vicar apostolic of the London District. In 1850 he was created a cardinal and appointed archbishop of Westminster. He had already had considerable influence on the Oxford Movement (q.v.), and as archbishop he did much to aid the cause. The indignation aroused among English Protestants by the papal establishment in England of a hierarchy with territorial titles was allayed by his conciliatory pamphlet, *An Appeal to the Reason and Good Feeling of the English People on the Subject of the Catholic Hierarchy* (1850). Among Wiseman's other published writings are *Twelve Lectures on the Connexion Between Science and Revealed Religion* (1836); *Fabiola*, a popular novel dealing with the early Christian church (1854); *Recollections of the Last Four Popes and of Rome in Their Times* (1858); and *Points of Contact Between Science and Art* (1863).

WISENT. See **BISON**.

WISHART, wīsh'ärt, **George**, Scottish reformer and martyr: b. ?1513; d. St. Andrews, Scotland, March 1, 1546. He was probably born at Pitarrow, near Montrose, and educated at King's College, Aberdeen. While a schoolmaster at Montrose, he was accused of heresy for teaching the Greek New Testament, and in 1538 left for England, only to incur a similar charge at Bristol in the following year. Between 1539 or 1540 and

1543 he traveled on the Continent, probably in Germany and Switzerland, and then became a member of Corpus Christi College at Cambridge. Returning to Scotland in 1544, he embarked on a preaching tour that took him to Montrose, Ayre, Kyle, Dundee, Perth, Leith, and Edinburgh. His eloquent advocacy of the Reformation had great influence on John Knox, who became his intimate friend. In 1545, at the instigation of Patrick Hepburn, 3d earl of Bothwell, he was arrested at Ormiston; he had refused to allow Knox to share this risk with him. Tried for heresy by a convocation of bishops and other clergy under David Cardinal Beaton at St. Andrews in February 1546, he was condemned to death and burned at the stake.

WISHAW. See MOTHERWELL AND WISHAW.

WISHBONE BUSH, wīsh'bōn bōōsh, a colloquial name sometimes used for the plant *Mirabilis laevis*, and the closely related *M. Bigelovii*, in the four-o'clock family, Nyctaginaceae, because of the rather regularly forked branches, which suggest a wishbone. *M. laevis* is a partially woody bush, a foot or somewhat more in height, with oval, more or less heart-shaped leaves and rose-purple flowers about half an inch in length. It is native to California and Lower California. *M. Bigelovii*, which is sometimes included in *M. laevis*, differs chiefly in having sticky-hairy leaves and pink or white flowers.

EDWIN B. MATZKE.

WISHRAM, wīsh'rām, a small tribe of American Indians of the Chinookan language family, most closely related to the Wasco Indians (q.v.). The name by which they are known is that of their main village and means a species of flea. They call themselves Tlakluit. The Wishram live along the north bank of the Columbia River, in Klickitat County, Washington, and subsist largely on salmon. Although they took part in the Yakima Treaty of 1855, they are not reservation Indians. In 1960 they numbered approximately 125 individuals.

FREDERICK J. DOCKSTADER.

WISMAR, vīs'mär, city, Germany, in Rostock District, situated on Wismar Bay on the Baltic Sea, 35 miles east of Lübeck. It is a fishing and shipbuilding center; industries include sugar refining, distilling, metalworking, and the manufacture of railroad cars and machinery. It has a number of residences and warehouses dating from the 15th century, together with several churches of the same period, including the Marienkirche (a reproduction of a church in Lübeck) and St. George's Church, well known for its wood carving and murals. Interesting also is the Fürstenhof, a 16th century princely court constructed in Italian Renaissance style. Wismar, first mentioned as a town in 1229, was the residence of the princes of Mecklenburg from 1256 to 1306 and was a member of the Hanseatic League. Under the Treaty of Westphalia at the end of the Thirty Years' War in 1648, it passed to Sweden; in 1803 it was pledged to Mecklenburg with the privilege of recall for 100 years, a right which Sweden renounced in 1903. Very heavily damaged in World War II, Wismar was occupied successively by British and Soviet troops, and after the war passed to East Germany (German Democratic Republic). Pop. (1960) 55,400.

WISSLER, wīsl'är, Clark, American anthropologist: b. Wayne County, Ind., Sept. 18, 1870; d. New York, N.Y., Aug. 25, 1947. After teaching in rural schools in Indiana (1887-1892) and serving as a high school principal in Hagerstown, he entered Indiana University to secure an A.B. degree in 1897 and an A.M. in 1899; in 1901 he received a Ph.D. in psychology from Columbia University. His interest had centered in psychology and education; he had been James McKeen Cattell's assistant at Columbia, and he continued as instructor in pedagogy at New York University (1901-1902) and carried on laboratory investigations in individual differences in mental ability at Columbia (1901-1903). But he had also studied under the anthropologists Franz Boas and Livingston Farrand, and in 1902 he became assistant in ethnology at the American Museum of Natural History. He advanced to the post of acting curator in 1905 and curator in 1906, lectured in anthropology at Columbia (1905-1909), and from 1907 to 1942 was curator in the department of anthropology at the American Museum, becoming curator emeritus in 1942.

After accepting his appointment at the American Museum in 1902, Wissler completed a series of field studies of the Plains Indian tribes of North America (1902-1905). Thereafter, as administrator, he sponsored and guided many research projects not only in ethnology but in archaeology and physical anthropology. He was a perceptive and prolific writer. His book *The American Indian* (1917; 3d ed., 1938) for the first time brought together in genuinely scientific fashion the accumulated knowledge on the environment, culture, speech, prehistory, and physique of the natives of the Americas. Other books, such as *Man and Culture* (1923; rev. ed., 1938), *The Relation of Nature to Man in Aboriginal America* (1926), and *An Introduction to Social Anthropology* (1929), dealt with the conceptualization of culture and the fields of phenomena related to it. In these works, as in various monographs and many articles, his ability to simplify, synthesize, and interpret played an important part in the development of anthropological research and concepts.

Wissler also served as professor of anthropology at the Institute of Human Relations at Yale (1924-1940) and as dean of the scientific staff at the American Museum (1935-1942). From time to time, in various official positions, he actively participated in the work of the National Research Council, the National Park Service, the American Museum Association, and various other learned societies and professional organizations.

JUNIUS BIRD,
Department of Anthropology, American Museum of Natural History.

WISSMANN, vīs'män, Hermann von, German army officer and explorer: b. Frankfurt an der Oder, Germany, Sept. 4, 1853; d. Weissenbach, Austria, June 15, 1905. Entering the German Army, he reached the rank of major by 1889. In 1880-1883, in the employ of the German African Association, he accompanied Paul Pogge on a west-east African expedition. Pogge went as far as Nyangwe in the Belgian Congo, while Wissmann continued alone to Zanzibar. On a second expedition, undertaken for Leopold II in 1884-1885, Wissmann explored the Kasai River. A third expedition in 1886-1887 took him from Lubutu on the Congo to Mozambique by way of

the Sankuru, Lake Nyasa, and the Zambezi. Appointed imperial German commissioner in 1889, he suppressed an Arab revolt in East Africa. He resigned his office in 1891, but returned to the area as governor of German East Africa (now Tanganyika) in 1895-1896. Wissmann published several books on his expeditions, including *Im innern Afrikas* (with others, 1888); *Unter deutscher Flagge quer durch Afrika* (1889); *Meine zweite Durchquerung Äquatorial-Afrikas* (1890); and *Afrika* (1895).

WISTAR, wîs'tûr, **Caspar**, American physician: b. Philadelphia, Pa., Sept. 13, 1761; d. there, Jan. 22, 1818. The grandson of the colonial glass manufacturer Caspar Wistar (1696-1752), he received his medical education at the University of the State of Pennsylvania (B.M., 1782) and at Edinburgh University in Scotland (M.D., 1786). While in Edinburgh he was twice president of a student organization, the Royal Medical Society, and assisted in organizing a natural history society. Returning to the United States in 1787, he practiced in Philadelphia. In 1789 he was appointed professor of chemistry at the medical school of the College of Philadelphia, and after that institution and the University of the State of Pennsylvania were united as the University of Pennsylvania in 1791, he became adjunct professor of anatomy, surgery, and midwifery at the combined school. From 1808 to 1810 he served as professor of anatomy and midwifery, and thereafter as professor of anatomy. His textbook, *A System of Anatomy for the Use of Students of Medicine* (2 vols., 1811-14), was the first such American work. He had a broad range of interests, including other sciences and the humanities, and was elected to the American Philosophical Society in 1787, succeeding Thomas Jefferson as its president (1815-1818). He opened his home once a week to members of the society and visiting scientists; these famous meetings, which continued after his death, were known as the Wistar parties. Thomas Nuttall named the wisteria for Wistar, and the Wistar Institute of Anatomy and Biology was founded in his honor in 1892 by his grandnephew, the penologist Isaac Jones Wistar (1827-1905).

WISTARIA. See **WISTERIA**.

WISTER, wîs'tûr, **Owen**, American novelist: b. Philadelphia, Pa., July 14, 1860; d. North Kingstown, R.I., July 21, 1938. The grandson of the actress Fanny Kemble, he was educated at Harvard University, from which he graduated in 1882, and then went to Paris to study music. Although he showed talent as a composer, he decided against a musical career and returned to the United States two years later. After studying law at Harvard, he was admitted to the Pennsylvania bar in 1889. Meanwhile, he had begun to spend his summers in the West, and he found the region of such interest that he began to write stories about it. Now wholly devoted to a literary career, he published the collections *Red Men and White* (1896); *Lin McLean* (1898); and *The Jimmyjohn Boss, and Other Stories* (1900). *The Virginian* (1902), his most celebrated novel, with its chivalrous cowboy hero and realistic Western setting, became the prototype of many stories and novels by other writers. A best seller, it was also popular in play and film versions. Wister's non-Western novels, such as *Philosophy* (1903)

and *Lady Baltimore* (1906), were less successful, but he wrote well-received biographies of three presidents: *Ulysses S. Grant* (1900); *The Seven Ages of Washington* (1907); and *Roosevelt—The Story of a Friendship, 1880-1919* (1930). His collected works, *The Writings of Owen Wister*, were published in a series of 11 volumes in 1928.

WISTERIA or **WISTARIA**, wîs-tîr'ë-ə, a genus of woody, twining vines in the bean or pea family, Leguminosae. It is named for Caspar Wistar (q.v.), and includes nine species, two of North America and seven of eastern Asia. The species have odd-pinnate leaves of numerous leaflets and long, drooping, graceful racemes of bluish purple flowers, similar to those of the pea, that bloom before the leaves are fully expanded. A second, smaller set of flowers often appears later in the summer. *W. frutescens* and *W. macrostachya* are indigenous to the southern and central United States.

Wisteria (*Wisteria sinensis*) resting against a house wall. Inset shows close-up of flowers.

The most commonly grown species is *W. floribunda*, of Japan. It covers walls and trellises in spring with its attractive, fragrant racemes, which may attain a length of one and one-half feet; the leaves have 15 to 19 leaflets. White-flowered and double-flowered varieties also are cultivated. The Chinese wisteria, *W. sinensis*, also seen in cultivation, differs from its Japanese counterpart in having fewer (usually 11) leaflets, shorter racemes, and slightly larger individual flowers.

EDWIN B. MATZKE.

WITCH HAZEL, wîch hā'zəl, the colloquial name of any plant in the genus *Hamamelis* of the family Hamamelidaceae, or of the extract of *H. virginiana*. The genus includes five species, of which two are native to eastern and central North America and three to eastern Asia. *H. virginiana*, the common witch hazel of eastern North America, is a shrub or small tree with alternate, oval, wavy-margined leaves that turn pale yellow in

Witch hazel (*Hamamelis mollis*).
Left: Flowers contain four separate strap-shaped petals. Right: Close-up view of leaf.

Roche

autumn. It blooms mostly in October and November. Its flowers have four yellow, strap-shaped petals, four fertile stamens and four staminodia, and a fruit which matures a year later. The two hard, shiny, black seeds are forcibly squeezed out of the woody capsule as it splits progressively from the top and are hurled for considerable distances. The witch hazels are unusual, especially among trees and shrubs, in their time of flowering. In contrast to *H. virginiana*, *H. vernalis*, of the south central United States, and *H. japonica* of Japan and *H. mollis* of China, Asiatic species planted as ornamentals, bloom from December or January to March or April.

Twigs and crotches of *H. virginiana* have been used as divining rods. Witch hazel extract, *aqua hamamelidis*, which is distilled from the bark and twigs, has been utilized in medicine. It is applied externally in alcoholic solution to soothe irritations, although its therapeutic properties are questionable.

EDWIN B. MATZKE.

WITCH OF ENDOR, ʔn'dōr. According to Biblical history (I Samuel 28:7-25), King Saul, on the eve of the battle at Mount Gilboa, ordered his servants to find him a woman who "hath a familiar spirit" (King James Version) or "is a medium" (Revised Standard Version). Despite Saul's earlier order forbidding the practice of witchcraft (I Samuel 28:3), one such woman was still known to be living at Endor, near Nazareth, and he went to consult her. She invoked the spirit of Samuel, who prophesied the victory of the Philistines and Saul's death. After the warning, she prepared a meal for the king and gave him shelter for the night.

WITCHCRAFT, wīč'krāft, the practice of magic (q.v.) or sorcery. The word *witch* is derived from the Old English *wicce*, meaning "a female magician or sorceress," but although the terms "wizard" and "warlock" are available for male magicians, "witch" and "witchcraft" are generally applied to both sexes and their magical activities. Among many peoples accidents, sickness, death, and other untoward events have been thought to be caused by witches—individuals who had magical power which they used for evil purposes. Magic could, in primitive belief, be used for good; the practitioners of beneficent magic were often regarded as priests, using their power

for the common good; or a distinction was made between white or beneficent magic and black, malevolent magic. The Maori of New Zealand had schools which offered a rigorous training in magic. Most of the graduates used their magic for such purposes as assuring the success of voyages, protecting property, and curing sickness, but some would, for a fee, work magic to produce misfortune or death to an enemy of the client. In the Nilgiri Hills of southern India one of the most primitive tribes, the Kurumba, was noted for its powers of witchcraft, and members of other tribes in the area employed Kurumba witches to wreak vengeance on their enemies.

In Negro Africa, where witchcraft is widespread, the Lovedu (Lobedu) distinguish not only between good magicians and evil magicians or witches, but between day and night witches. The day witches, although they cause sickness and death, are not mysterious, for they use the herbs and drugs known to respectable medical practitioners of the tribe. Although they poison their victims, it is possible for a regular medicine man to identify the poison and supply an antidote. The night witches are mysterious in their procedure, and so are infinitely more terrifying. They are believed to have powers to ride invisibly through the air. They can cause disease, barrenness, and unproductive fields, among other calamities, and are particularly feared because no one knows how they operate. If witchcraft is suspected, a witch doctor is called in to divine the cause and set up countermagic. The day witches of the Lovedu operate knowingly. It is less certain that night witches exist except in the minds of the people who fear them.

In Europe witchcraft has a long history. Early Greek literature refers to witchcraft. Best known is the legend of Circe, who had the power to transform men to beasts. The Goetae (*goētes*), who voiced their incantations with wild shrieks and howls, were feared for their malevolent powers and sold love philters and poisons for money. Hecate, goddess of sorcery and witchcraft, haunted crossroads and graveyards and wandered by night, when dogs warned of her approach by barking. The English writer Montague Summers has suggested that the *goētes* and Hecate represent an indigenous religion partially displaced by more fashionable cults imported from the Middle East and elsewhere. In western Europe also witchcraft probably represents a sur-

WITCHES' BROOM

This illustration from a 16th century German pamphlet shows three witches being burned at the stake in October 1555.

The Mansell Collection, London

vival of the pre-Christian religion of the area. The archaeologist Margaret Murray believes that the Satan of the European witch cult is related to the horned god pictured in cave paintings and rock carvings found in late prehistoric sites all the way from Spain to Russia. There is historic evidence that pagan religious rites were little affected by the Romans and were often practiced in Roman temples in Britain and Gaul. When Christianity was introduced into western Europe, many pre-Christian rites became associated with Christian ritual. As late as the 17th century it was said in France that "the greater part of the priests are witches." During the early centuries the church was tolerant of the popular religion, but by the 14th century it was sufficiently established to try to stamp out the pagan cults that flourished beside or even within the church.

While the church was attempting to eradicate popular pre-Christian rites, these rites were taking on a Christian coloration. The church held as dogma the opposition of good and evil. God was good; Satan, according to Dr. Murray's thesis, became identified with the pagan European horned god. The popular pagan religion seems to have accepted this antithesis and to have developed a ritual which was imitatively contrasted to the Christian faith. Infants were baptized at the quarterly sabbats (witches' sabbaths) held at Candlemas (February 2), May Day Eve (Walpurgis Night, April 30), Lammas (August 1), and All Hallow Eve (Halloween, October 31); marriages were solemnized at the sabbats; and the religious rites included the distribution of bread and wine, in imitation of the Eucharist. The church equated the popular pagan deity with the principle of evil, the Devil, and popular rites with witchcraft. A Biblical exhortation, "Thou shalt not suffer a witch to live" (Exodus 22:18), was held to justify the witch-hunt that flourished for several centuries. The bishop of Coventry, who led a fertility dance in his churchyard in 1303, escaped trial because he was a bishop. In 1323 a lady was tried for worshiping a deity other than God but was let off because of her rank, but in 1431 Joan of Arc was burned at the stake for witchcraft, and in 1484 Pope Innocent VIII issued a bull against witches. It has been estimated that during the next three centuries 300,000 to 2,000,000 persons were executed as witches. It is difficult to know how many of the victims were followers of the old pagan religion, but many lost their lives in the general hysteria

simply because they were not liked in their communities, or how many genuinely believed themselves to be witches—to have magical powers to do evil. Certainly many innocent persons lost their lives, as in the Salem (Mass.) witch-hunt of 1692, which was begun by children who found diversion in the voodoo tales told by a West Indian slave woman and who, once they had started making accusations of witchcraft, found it easier to continue than to retract.

Among the practicing witches, one should distinguish between the simple women who dealt in herbs and charms to help their fellows as well as, on occasion, to injure them, and the ever-decreasing number of persons who clung to pagan religious rites. A belief in witchcraft persisted long after the witch hunt subsided. The Scottish poet Robert Burns described witches' sabbaths in his *Tam o' Shanter* and *Halloween*, and the witch-on-broomstick motif of modern Halloween decorations is a reminder of an earlier belief that witches flew through the air on Halloween. There may have been witches who believed themselves capable of such supernatural acts, for the drug plants they are recorded as using—opium poppy, mandrake, belladonna (deadly nightshade), and Indian hemp—are known to produce hallucinations and vascular excitement. The use of charms to cause illness or death has not completely died out: there is record of a man dying of witchcraft in New York in 1940. This last may seem strange to one living in a scientific world, but it is well established by observers of primitive societies where witchcraft prevails that people can die of witchcraft. The belief that one is a victim of witchcraft is psychologically as potent as actual magic could be. As for the great witch-hunt which shook Europe for several centuries, it has bequeathed to the English language the term "witch-hunt" in the meaning of "searching out and harassing proponents of an incompatible political philosophy."

ELIZABETH E. BACON
Anthropologist

WITCHES' BROOM, wích'əz brōöm, a bunch of many upright or spreading, abnormally clustered branches or twigs that is formed on plants

Roche

Witches' brooms on Mississippi hackberry.

as a result of attack by parasites. Witches' brooms are symptoms of infection. Although they can occur on nonwoody plants such as alfalfa, potato, and aster, they are most familiar on shrubs and trees, where some may exceed 10 feet in diameter. They may resemble a bush, a bird's nest, or a handleless broom attached to the host plant. Some may consist wholly or partially of dead branches; others, of living branches that can continue to grow for many years. The leaves they bear may be distorted; they may appear later in spring and drop earlier in fall than the normal leaves of the plant, and they may be yellowed. Flowers are rarely produced.

The parasites whose presence stimulates the formation of witches' brooms include fungi (on alder, birch, red cedar, and white cedar); bacteria (on pine); dwarf mistletoes (on pine, larch, and fir); viruses (on peach and black locust); and mites (on hackberry and willow). The stimulus responsible for certain types of witches' brooms is not well understood. Some witches' brooms may cause stunting or even death of the host plant, especially when many brooms develop on one individual. Other kinds do not appear to damage the host appreciably; however, they are unsightly and therefore may be objectionable, especially on street and ornamental trees. Control of witches' brooms on woody plants is best accomplished by removing and burning the brooms.

Chicago Natural History Museum

WITENAGEMOT or **WITENAGEMOTE**, wīt'ə-nā-gə-mōt (Old English *witan*, sages or councilors + *gemōt*, meeting), originally an assemblage of the freemen, at first of a tribe and later of the whole state, among the Anglo-Saxon conquerors of southern Britain. In time it evolved into an assembly of nobles, large landowners, and leading ecclesiastics. It met irregularly, and its composition fluctuated at the pleasure of the king. While its powers were largely advisory, the stature of its members gave it considerable influence. The Witenagemot elected the king in the event of a disputed succession; approved the regular succe-

sion if there was no dispute; served as the highest judicial court; and authorized laws, taxes, and other public measures. It passed out of existence at the Norman Conquest, and the later English Parliament was a separate growth and not a continuation of the Witenagemot.

See also COURT, JUDICIAL—*Anglican*.

WITHER, with'ūr, or **WITHERS**, with'ūrz, **George**, English poet and pamphleteer: b. Bentworth, Hampshire, England, June 11, 1588; d. London, May 2, 1667. Wither spent two years (1604–1606) at Magdalen College, Oxford, leaving without a degree. He entered Lincoln's Inn in 1615, but he seems to have been more interested in writing than in law. His first major work, 20 satires entitled *Abuses Stript and Whipt* (1613), although popular with readers, caused the government to imprison him. The Princess Elizabeth (daughter of James I), to whom he had addressed an epithalamium, secured his release after a few months. Wither then produced his most successful effort, *The Shepherd's Hunting* (1615), in imitation of William Browne's pastorals. The acclaim given this pastoral encouraged him to publish another, *Fidelia* (1615), which contains the famous lyric "Shall I Wasting in Despair?" *Wither's Motto* (1621), a mixture of pious reflections and satire against vice, again proved popular with readers but brought charges from the government, which were ultimately dropped. In 1622 he produced what was to be his last attempt at pure poetry, *Faire-Virtue, the Mistress of Phil'arete*.

Wither continued to turn out verse and prose until his death. Of his more than 100 separate published works, three fourths were produced after 1625. These writings, however, are different from the earlier poetry, for he had turned his talents to the service of the Puritan cause as a pamphleteer. He was a soldier, civil servant, humanist, and, above all, prophet and reformer. He came to believe that his mission in life was to prophesy and to preach "inner reform," a reflection of his strong belief in individualism. Despite the fact that he gained little recognition and even suffered imprisonment (1660–1663) for the sake of this unpopular cause, Wither continued to prophesy doom to a Britain which refused to reform. Most of his post-1625 writings touch on this subject. The best known are *Britain's Remembrancer* (1628), *Emblemes* (1635), and *Halelujah, or Britans Second Remembrancer* (1641). His last published work was a series of extracts from these prophetic writings, *Ecchoes from the Sixth Trumpet* (1666).

Wither was not a fanatical, self-righteous Puritan. He was learned; he had a sense of humility; he was moderate, even liberal in his toleration; and his individualism caused him to put his principles, particularly his strong belief that it was his mission in life to preach "inner reform," above party.

DONALD B. CLARK
Professor of English
University of Missouri

WITHERITE, with'ūr-it, the mineral form of barium carbonate, BaCO₃, named for the English scientist William Withering (1741–1799). Although it is usually found in a massive condition, orthorhombic crystals sometimes occur. It has a hardness of 3 to 3.7, a specific gravity of 4.2 to 4.35, and a vitreous luster; its color is white, often

yellowish or grayish, and it has a white streak. Not a common mineral, it is often associated with galena and barite. Its main source is Cumberland and Northumberland in England, although it is also found in Lexington, Ky.; El Portal, Calif.; Rosiclare, Ill.; Freiburg, Germany; and elsewhere. It is used in refining sugar, making plate glass, and for adulterating white lead and zinc white.

WITHERSPOON, wĭth'ŭr-spōon, **Herbert**, American singer: b. Buffalo, N.Y., July 21, 1873; d. New York, May 10, 1935. While a student at Yale University, from which he graduated in 1895, he decided to become a professional singer. He studied theory with Horatio Parker and Edward MacDowell, and then took voice lessons in New York, London, Paris, and Berlin. His operatic debut was made with the Castle Square Company in New York in 1898. For several years he devoted himself mainly to concert work, touring the United States with the Thomas and Pittsburgh orchestras, before joining the Metropolitan Opera House as first basso in 1908. He remained with the Metropolitan for eight years, specializing in Wagnerian roles. Thereafter he used his gifts in concert work and as a successful teacher. He published *Singing* (1925) and *36 Lessons in Singing for Teacher and Student* (1930). From 1925 to 1929 he was president of the Chicago Musical College, and in 1930-1931 served as director of the Chicago Civic Opera Company. He was director of the Cincinnati Conservatory of Music in 1932-1933, and then returned to New York City. In March 1935 it was announced that he would succeed Giulio Gatti-Casazza as director of the Metropolitan Opera House, but he died two months later.

WITHERSPOON, John, American Presbyterian clergyman, educator, and patriot: b. Yester, near Edinburgh, Scotland, Feb. 5, 1723; d. near Princeton, N.J., Nov. 15, 1794. He received his divinity degree from Edinburgh University in 1743. As pastor of Paisley (1757-1768) he became widely known as a leader of the conservative group of the Presbyterian Church. Accepting an invitation to become president of the College of New Jersey (now Princeton University) in 1768, he held that position until his death. An ardent advocate of the colonial cause, he represented New Jersey in the Continental Congress from 1776 to 1782, with some intermissions, and was the only clergyman to sign the Declaration of Independence. During the Revolution he served on numerous committees and performed many valuable functions, particularly in connection with foreign relations, finance, and securing supplies for the army. After the war he renewed his efforts to organize the Presbyterian Church in the United States and, in spite of the setbacks caused by the war, to realize the vast potentialities of Princeton College; during his administration many future leaders of the country were trained there, including James Madison, William Bradford, Philip Freneau, and Henry Lee.

Witherspoon's religious and political writings include *Ecclesiastical Characteristics* (1753); *A Serious Enquiry into the Nature and Effects of the Stage* (1757); *Essays on Important Subjects* (2 vols., 1765); and *Considerations on the Nature and Extent of the Legislative Authority of the British Parliament* (1774), for a while attributed to Benjamin Franklin. His collected works were published in 1804-1805).

WITHHOLDING TAX. See **INCOME TAX—United States**.

WITMER, wĭt'mŭr, **Lightner**, American psychologist: b. Philadelphia, Pa., June 28, 1867; d. there, July 19, 1956. He was one of a group of brilliant young American students who went to the University of Leipzig for doctoral study in the field of experimental psychology under Wilhelm Wundt. After earning his doctorate in 1892, he became director of the laboratory for experimental psychology at the University of Pennsylvania. Here, in 1896, he opened a psychological clinic, the first of its kind anywhere, in which psychological techniques and principles were applied in child guidance. The laboratory and clinic were reorganized as a department of the university in 1909, and he served as director until his retirement in 1937. He also helped to establish clinics for the treatment of speech disorders, for vocational guidance, and for educational disabilities. In 1907 he founded the journal *Psychological Clinic*, which did much to establish clinical psychology as a new profession. Although he and his students developed many psychological tests and measures (especially of the performance or non-verbal type) to facilitate diagnoses of individuals in trouble, Witmer's interest was directed more to qualitative analyses than to mere quantitative scores based upon routine testing.

PHILIP L. HARRIMAN,
Professor of Psychology, Bucknell University.

WITNESS, wĭt'nəs, in law, a person called upon to give relevant testimony under oath, as in a court of justice, with respect to something he has seen, heard, or otherwise observed. It is generally held that a witness is competent to testify if he is of sufficient age and intellect to understand and communicate what he has observed and to appreciate the significance of an oath. A witness, either in a civil or criminal case, may be compelled to attend court when required by law. He is commonly summoned by a subpoena, and if he does not attend when properly called and lacks sufficient excuse for his absence, he may be punished for contempt by fine or imprisonment. In addition, he may be liable for damages suffered by the party who subpoenaed him. A witness is exempt from civil arrest while in attendance at court, but not from arrest on a criminal charge. He usually testifies orally in open court, but sometimes his testimony is taken in writing before a commissioner or some other legal official.

Formerly many objections against the competency of witnesses were allowed, but many of these have been removed by legislation. In the absence of statutes to the contrary, a wife is usually not a competent witness against her husband in either a civil or criminal case, or a husband against his wife. Generally a witness cannot be compelled to give evidence in which he may incriminate himself, and the accused in a criminal case cannot be called as a witness for the prosecution to give evidence against himself. In most jurisdictions, confidential communications between an attorney and his client or between a doctor and his patient are privileged, and the attorney or doctor cannot testify as to those communications unless the client or patient waives the privilege.

J. WILLARD O'BRIEN,
Attorney at Law.

WITTEKIND, vīt'ə-kīnt, or **WIDUKIND**, vē'dōo-kīnt, Saxon leader in the struggle with Charlemagne: d. about 807. He came of a noble Westphalian house and first appears at the head of the Saxon expedition in Westphalia in 774. Charlemagne's return from Lombardy drove him across the Weser. He took refuge in Jutland and renewed the revolt in 776, refusing, unlike many other Saxon leaders, to submit to the emperor at the Diet of Paderborn in 777. He returned during Charlemagne's absence in Spain, laid waste the Rhineland, and is believed to have surprised and annihilated the Frankish army at Sünfel on the Weser in 782. The emperor retaliated by executing 4,500 Saxon prisoners, an act that aroused all Saxons to arms and for the first time united them behind a single leader in opposition to Charlemagne. Nevertheless, after heroic resistance, Wittekind was forced to submit (785) and to accept baptism in the imperial camp at Attigny in Champagne.

It is difficult to establish the facts of his later life; he became a great hero to the Saxons, and many conflicting legends have grown up about him. Charlemagne is believed to have made him duke of the Saxons, and he is said to have died in battle in 807 and to be buried in the parish church at Enger in Westphalia.

WITTELSBACH, vīt'əls-bākH, the name of a historically significant German family, one of the four dynasties (Habsburg, Hohenzollern, Wittelsbach, and Wettin) which were to shape Germany (representing respectively Austria, Brandenburg, Bavaria, and Saxony). The ancestral castle of Wittelsbach, near Aichach in Upper Bavaria, was destroyed in 1209; the spot is marked by a church and an obelisk.

Two Wittelsbacher were elected German emperors: Louis the Bavarian, who reigned as Emperor Louis IV from 1314 to 1347; and the Elector Charles, who reigned as Charles VII from 1742 to 1745. (See CHARLES VII, Holy Roman emperor; Louis—*Holy Roman Emperors*: Louis IV.) Another, Rupert (III), was German king from 1400 to 1410.

Collateral members of the house were margraves of Brandenburg in the 14th century, and kings of Sweden (Charles X Gustavus, Charles XI, and Charles XII) from the mid-17th to the early 18th century.

The first known Wittelsbacher was Margrave Liutpold, who took the title of duke of Bavaria and died in 907 near Pressburg while fighting against the Magyars. In the early 12th century, descendants of the Scheyern branch of the family moved to Wittelsbach and began to call themselves by that name. In 1115, Emperor Henry V recognized Count Otto V as count Palatinate in Bavaria. The latter's son, Otto VI, one of the most trusted adherents of Frederick I (Frederick Barbarossa), accompanied the German king on an Italian expedition and also rendered him valuable services in the Germanies.

When Henry the Lion, duke of Saxony and Bavaria, was placed under the imperial ban in 1180, Otto VI was invested as 1st duke of Bavaria (without Steiermark). The settlement of 1180 did away with the old tribal kingdoms, their places being taken by the territories of the "princes of the empire." Under the early Wittelsbachs, Bavaria increased in prosperity. Otto's descendants, with short interruptions, remained the rulers of Bavaria until the German revolution

of 1918. The story of the dynasty is closely associated with the history of Bavaria.

The possibility of Bavaria becoming the outstanding power in the Germanies (a goal later achieved by Prussia and the Hohenzollern family) was halted in 1255 when the duchy was split into two parts under two lines of the Wittelsbach family—the dukes of Bavaria (resident at Munich) and the counts of the Rhenish Palatinate (resident at Heidelberg). The history of Bavaria now became a melancholy chronicle of territorial divisions, family feuds, and petty quarrels, as the electoral dignity passed from one branch of the house to another. In 1329, Bavaria and the Palatinate were separated. In 1347, at the death of Louis IV, the Bavarian line lapsed into obscurity. In 1392 the duchy of Bavaria was separated into three parts—Ingolstadt, Landshut, and Munich. In 1504, Albert IV the Wise (1447–1508), defeated his cousin Rupert of the Palatinate and secured for himself succession to the united Bavarian dukedoms.

After the death of Albert the Wise, a partial division took place between his sons, William IV and Louis. On the death of the latter in 1545, William IV (r. 1508–1550) ruled over an again united Bavaria. William IV was loyal to the Catholic Church when almost every other secular prince of consequence became Protestant. As a reward the church granted him important influence in religious matters. The dukes of Bavaria were noted for their championing of Roman Catholicism against the Reformation, even though the Palatinate had espoused Protestantism.

Albert V (r. 1550–1579) and William V (r. 1579–1597), both excellent organizers and administrators, made Bavaria a prosperous country despite its lack of natural resources. Maximilian I (r. 1597–1651), who took an active part in the Thirty Years' War, recovered the Upper Palatinate. A compact and strong Bavaria was thus created that was able to play a role in the councils of Europe (see MAXIMILIAN I). The Wittelsbach policy remained in traditional opposition to the Habsburgs.

Maximilian III Joseph (r. 1745–1777) founded the Academy of Sciences in Munich. With his death the line of Bavarian electors became extinct. The new ruler of Bavaria was Charles Theodore, elector of the Rhenish Palatinate and duke of Jülich and Berg. Frederick II the Great supported the claims of the next heir, Duke Charles of Zweibrücken, against Austrian pretensions. Out of this conflict came the bloodless War of the Bavarian Succession, which ended on May 13, 1779, with the Treaty of Teschen. Austria was given the region of the Inn, with the town of Braunau (which later achieved notoriety as the birthplace of Adolf Hitler), but succession in the rest of the Bavarian dominions was guaranteed to Duke Charles.

Maximilian IV Joseph (r. 1799–1825) became King Maximilian I in 1806, to be followed in turn by Louis (Ger. Ludwig) I, Maximilian II, Louis II, Otto I, and Louis III. With the abdication of the last of these in 1918, the dynasty ended, the Bavarian monarchy was abolished, and Bavaria became a republic. See LOUIS, kings of modern Bavaria; MAXIMILIAN, kings of Bavaria; OTTO I, king of Bavaria.

LOUIS L. SNYDER,
*Professor of History, The City College of the
City University of New York.*

WITTEN, wīt'an, city, Germany, in the State of North Rhine-Westphalia, situated on the Ruhr River, 10 miles southwest of Dortmund. It is a modern industrial city and steel-manufacturing center and has plants for the fabrication of glass and chemicals and the extraction of coal-tar products; it is also a repair center for the German federal railroads. Its few historic buildings include Castle Steinhausen; St. John's Church, remodeled in 1762; and the Museum of Natural History, which contains a notable geological collection. Witten received its charter as a city in 1825. It suffered considerable damage from bombings during World War II. After the war, it was included in the British Zone of Occupation and later in the German Federal Republic (West Germany). Pop. (1961) 96,500.

WITTENBERG, wīt'an-bûrg, Ger. wīt'an-berkh, city, Germany, situated in Saxony-Anhalt, on the Elbe River, 55 miles southwest of Berlin and 35 miles northeast of Leipzig. It is an East German rail center and industrial city with iron works, breweries, chemical plants, and numerous small enterprises manufacturing soap and various food products. There are important chemical works at Piesteritz, just to the west. Wittenberg is famous for its associations with the Reformation. The 15th century Schlosskirche, where Martin Luther and Melancthon are buried, still stands; on its door Luther nailed his 95 theses on Oct. 31, 1517; three years later, in the marketplace, he publicly burned the papal bull which threatened him with excommunication. His residence, built in 1502, was restored in 1844 and is now a museum exhibiting manuscripts pertaining to the Reformation. The first complete Lutheran Bible was published in Wittenberg in 1534. Melancthon's house still stands, as does that of Lucas Cranach the Elder, who was a burgomaster and established his school of painting here. The university, founded in 1502 by Frederick the Wise and absorbed by the University of Halle in 1817, included among its instructors Luther, Melancthon, Johann Bugenhagen, and Justus Jonas. Among other notable buildings are a 14th century church and the city hall, built in 1524.

First mentioned about 1180, Wittenberg received its city charter in 1293. From 1273 to 1422 it was the capital of the Ascanian dukes of Saxe-Wittenberg, who became electors of Saxony; it then passed to the house of Wettin. In 1547, in the Schmalkaldic War, it was captured by Charles V after the Battle of Mühlberg and was superseded by Dresden as the ducal residence. It was besieged and suffered further destruction during the Thirty Years' War (1618-1648) and the Seven Years' War (1756-1763), and in 1813 it was taken and fortified by Napoleon. In the following year it fell to Prussia. It came under Soviet domination in 1945 and after 1949 was included in the German Democratic Republic (East Germany). Pop. (1960) 46,000.

WITTENBERG UNIVERSITY (formerly **WITTENBERG COLLEGE**), institution of higher education located at Springfield, Ohio. Founded in 1845, it is supported and controlled by synods of the Lutheran Church in America. It consists of five units: the College of Arts and Sciences, the School of Professional Studies (including the School of Music), the Graduate Studies Division, Hamma Divinity School, and the School of Community Education. Women are admitted in all depart-

ments. Undergraduate courses lead to the degrees of bachelor of arts; bachelor of science; bachelor of fine arts; bachelor of music; and bachelor of science in education, business administration, medical technology, and religious education. Advanced degrees are bachelor of divinity and master of sacred theology, awarded by the Divinity School; and master of education, master of arts in sacred music, and master of religious education, awarded by the Graduate Studies Division. The library had 115,000 volumes in 1962. The college songs are *The Alma Mater* and *The Fight Song*. The college colors are cardinal and cream, and the team nickname is Tigers. There is an undergraduate registration of about 1,900, with a total of over 4,000 students in all units.

W. EMERSON RECK.

WITTGENSTEIN, wīt'gən-shtīn, Ludwig, Austrian-British philosopher: b. Vienna, Austria, April 26, 1889; d. Cambridge, England, April 29, 1951. Born of wealthy parents and trained as an engineer, he became interested in philosophy while doing aeronautical research in England. After studying with Bertrand Russell in 1912-1913, he began to write the only book he published during his lifetime, the famous *Tractatus Logico-Philosophicus* (parallel English-German ed., 1922). Enlisting in the Austrian Army as a volunteer in World War I, he was captured by the Italians and imprisoned near Monte Cassino. After the war he worked in Austria as a village schoolmaster and as a gardener in a monastery. In 1929 he returned to England to pursue philosophy at Cambridge University, where he lectured informally from 1930. He became a British subject in 1938 and was appointed a professor at Cambridge in 1939. During World War II he worked as a hospital porter and medical assistant. He resigned his professorship in 1947 and died of cancer four years later, leaving a wealth of important writing for posthumous publication.

A man of exceptional literary and artistic gifts, Wittgenstein had a powerful, almost hypnotic personality which profoundly affected the many young English and American philosophers who became his pupils. In private life he was ascetic, of a strongly religious temperament (although he belonged to no sect), deeply attached to his friends, and imbued with a rare seriousness, as much ethical as intellectual. The power of his informal teaching could be compared with that of Socrates, whom he resembled in some ways, although his own philosophical path led in almost exactly the opposite direction. His lifelong stress upon the need for spontaneous discussion of deeply felt metaphysical problems, and the severe standards of expression he demanded, led him to delay publication of his views and discourage any report of them by his disciples. But as word of his later doctrines gradually circulated, he brought about what deserves to be called a revolution in modern philosophy.

Philosophy.—The *Tractatus* is one of the most cryptic of all philosophical classics, written in the form of brief epigrams, in a style permeated with striking visual metaphors. Designed originally as a study of the foundations of logic and mathematics, it gradually broadened into an attempt to solve once and for all the central metaphysical problems of the nature of reality. Its chief novelty lies in the attempt to draw metaphysical conclusions from the essential character of the language

in which thought about reality must be expressed. Wittgenstein viewed language as composed of "logical pictures" in which words are substitutes for simple objects and the manner of their combination in sentences reflects the way things hang together in reality. Profound analysis of the necessary character of any representation of reality led Wittgenstein to the striking conclusion that the logical structure which language shares with reality cannot itself be stated but must "show" itself through the limitations of discourse. When an attempt is made in metaphysics to transgress these limits, the result is nonsense, a breakdown of language. Much traditional philosophy is the attempt to say the unsayable, and the *Tractatus* ends with the famous words, which also apply to its own teaching: "Whereof one cannot speak, thereof one must be silent."

This repudiation of traditional philosophy became a central doctrine of the influential philosophical movement known as logical positivism, whose leading figures adapted other parts of the *Tractatus* to their own program. Although Wittgenstein concluded that metaphysics, including his own inquiry, could only result in nonsense, he assigned a positive task to philosophy—the clarification of concepts, which he called the "critique of language." His early masterpiece includes penetrating and stimulating remarks about logic, mathematics, science, and ethics.

In later life, Wittgenstein rejected as profoundly mistaken the metaphysical picture of a formal correspondence between language and reality which dominated his early book. Philosophers, he said, have constantly gone astray by taking too narrow and one-sided a view of language and the thought it expresses. With inimitable ingenuity and expressiveness, he exhibited the endless variety of linguistic practices. Philosophical perplexity arises when "language idles" by being detached from its proper uses within the concrete settings of the "ways of life" to which it belongs. In a long series of detailed studies in the theory of knowledge, logic, and aesthetics, Wittgenstein went far toward making this claim good. To philosophers reared more conventionally, his emphasis upon close attention to the uses of language often seems irrelevant, and his dismissal of metaphysics as a "mental cramp" appears arbitrary. It is widely acknowledged, however, that Wittgenstein introduced a new style of philosophizing whose effects are likely to be enduring.

WITWATERSRAND, wīt-wō'tərz-rānd (Afrikaans for "ridge of white waters"; commonly known as **THE RAND**), a series of parallel ranges running from east to west across the Province of Trans-

Information Service of South Africa

These men are leaving the shaft head after working their shift in a Witwatersrand gold mine. There are more than 40 such mines in the Rand.

vaal in the Republic of South Africa, at heights of 5,000 to 6,000 feet above sea level. It is the greatest gold-producing area in the world. The Witwatersrand forms the watershed between the Vaal and Olifants rivers, the former reaching the Atlantic Ocean by way of the Orange River while the Olifants is a tributary of the Limpopo, which flows into the Indian Ocean. The area is about 25 miles wide and extends more than 60 miles from west to east, from Krugersdorp to Springs, with Johannesburg (5,750 feet above sea level) in the center, 480 miles by rail from the Indian Ocean seaport of Durban and 958 miles by rail from Cape Town.

The proven gold area, occupying a strip of country 2 to 7 miles in width, widening in the East Rand to 18 miles, is marked by an almost continuous line of mines with huge white man-made mountains of crushed rock left after the extraction of the gold. The gold occurs in reefs or thin bands of quartz-pebble conglomerates in the Witwatersrand geological system, which consists of a series of beds of quartzites and shales. The reefs resemble a Dutch sweet made of almonds and brown sugar, called banket, and are therefore known as "banket." Of all the reefs, the most productive has been the Main Reef, which in the Central and East Rand consists of three parts (Main Reef, Main Reef Leader, South Reef), each consisting of one or more bands of conglomerate. The Main Reef Leader, varying in thickness from a few inches to as much as 10 feet, is the principal source of ore on the Rand.

Various gold discoveries were reported in the Transvaal after 1850, but the development of the Rand dates from 1884, when Fred Struben,

aided by his brother Harry, discovered that the blanket reef was auriferous. In 1886 the Main Reef was struck, the Witwatersrand goldfields were proclaimed public diggings, and the new settlement of Johannesburg was founded. Not until 1889 was it proved that the reef was not merely a surface deposit. Since then, mining has extended farther and farther below ground, and work now goes on in mines like the Crown and the Robinson Deep at depths of nearly 10,000 feet. Rock temperatures increase 1° F. for every 180 to 200 feet of depth, compared with an average of 1° F. for each 64 feet in most other parts of the world; nevertheless, very costly cooling and ventilation plants and drainage installations are required to make possible mining at such great depths. Water supplies have so far been adequate on the Rand, but they are likely to constitute an important problem in the future. Good-quality coal is readily available from the Witbank-Middelburg coalfield in eastern Transvaal.

There are between 40 and 50 gold-producing mines, of which the largest include the Blyvooruitzicht and Randfontein in the West Rand, the Crown mine in the Central Rand, and the Dagfontein and East Geduld in the East Rand. In 1960 the Transvaal produced about 14.6 million fine ounces of gold, more than two thirds of the South African total and almost one third of total world production.

In close association with the gold- and coal-mining industries, other industries have developed, including engineering, metal and cement manufacture, clothing, food processing, furniture, and diamond cutting; and the Rand dominates the economy of South Africa from every point of view. The expansion of industry and the concomitant increase of population have also created a huge agricultural market, notably for cereals, market gardening, and dairying. The total population of the Rand had reached almost 2 million by 1960, including nearly 750,000 Europeans. The largest towns, with preliminary census figures for 1960 (metropolitan or municipal areas), are Johannesburg (1,096,541); Germiston (204,605), the chief railway junction in South Africa and the site of the largest gold refinery in the world; Benoni (135,467); and Springs (135,231). Other important urban areas, some of which are contiguous with one another, include Brakpan, Roodepoort-Maraiburg, Krugersdorp, and Boksburg. Potchefstroom, and Klerksdorp, which are newer mining centers to the southwest, are sometimes included.

ROBERT W. STEEL,

John Rankin Professor of Geography, University of Liverpool.

WITWATERSRAND, University of the, a coeducational, state-supported university located at Milner Park, Johannesburg, South Africa. The largest English-speaking university in Africa, it has an average enrollment of about 6,000. There are eight faculties—arts, science, medicine, engineering, commerce, law, dentistry, and architecture. The institution was incorporated as a university by act of Parliament in 1921 and came into being on March 1, 1922, as the successor to what was originally the South African School of Mines, which had been founded in 1896 at Kimberley and transferred to Johannesburg in 1904. Bachelor's and master degrees are conferred by all of the faculties.

Among the institutions connected with the

university are the Bernard Price Institute of Geophysical Research (founded 1937), the Bernard Price Institute of Palaeontological Research (founded 1946), the Ernest Oppenheimer Institute of Portuguese Studies, and nuclear physics, economic geology, nutritional, cardiopulmonary, and dental research units of the South African Council for Scientific and Industrial Research. The university library contains about 350,000 volumes, including the Gubbins Collection of Africana and the Landau Collection of Hebraica and Judaica. *African Studies*, *English Studies in Africa*, and the *South African Journal of Medical Sciences* are among the publications of the university. Colors are blue and yellow, and the best-known college song is *Umpa*.

KENNETH ANDREW.

WITZ, vits, Konrad, Swiss painter and possibly wood carver: b. possibly in Constance (Baden) or Rottweil (Württemberg), Germany, c. 1400; d. Basel, Switzerland, before the end of 1446. Already fortified with Swabian matter-of-factness, he went to Basel about 1430, received the freedom of the city in 1435, and worked there until his death. He seems to have executed important commissions, but the larger works have been dispersed, with panels in various museums. The retable illustrating the doctrine *speculum humanae salvationis* (mirror of human salvation) was the most ambitious of these. From a later altarpiece (1444) comes his masterpiece, *Christ Walking on the Water*, in the Museum of Art and History at Geneva. E. H. Gombrich, in *The Story of Art* (4th ed., 1951), calls it "the first 'portrait' of a real view ever attempted." To capture the attention of the Genevois, Witz painted the very Lake Geneva which they saw every day. Contrasting the fishermen clumsily trying to keep the boat steady with the figure of Christ standing firmly on the water, Gombrich concludes: "It must have been a moving experience for the worshippers in Geneva when they saw it for the first time, when they saw the apostles as men like themselves, fishing on their own lake, with Christ walking on its familiar waters and exhorting them 'Be not afraid' (Matthew xiv. 27)." Possibly Witz alone among the painters of his time had the power to mingle the supernatural and the real with terrifying intensity. If he were not at his best in achieving such a combination, he might be dismissed as a mere realist, though as a realist admirably concerned with space relationships.

WALLACE BROCKWAY.

WIYOT INDIANS, wē'yōt, a small tribe of North American Indians, who with the neighboring Yurok, are the sole representatives in California of the Algonquian linguistic family. They inhabit the coastal region around Humboldt Bay, from Mad River to Eel River; hence their popular name of Humboldt Bay Indians. They are also known as Blue Lake Indians. The name Wishosk, which was once applied to them, is an error. Fewer than 230 survived by 1960. Of this number, perhaps about one quarter were full bloods.

FREDERICK J. DOCKSTADER.

WŁADYSŁAW. See LADISLAS.

WŁOCŁAWEK, vwō-tswā'vėk, city, Poland, in Bydgoszcz Province, on the west bank of the Vistula River, about 85 miles west-northwest of

Warsaw. A river port, served by the Łódź-Gdańsk railway, the city is the center of an important agricultural region. Local industries produce cellulose, paper, pottery, agricultural machinery, and metalware. Włocławek is the seat of a Roman Catholic bishopric and contains a famous 14th century Gothic cathedral and other medieval buildings. After a century of Russian rule, it was incorporated in the Polish republic in 1918 and restored to Polish rule after the German occupation in World War II. Pop. (1982) 110,000.

ELLSWORTH RAYMOND.

WOAD, wōd, a group of about 50 species of annual, biennial, and perennial herbs of the mustard family (Cruciferae), native to the Mediterranean region and eastward to Iran. Best known is dyer's woad (*Isatis tinctoria*), a European and south-west Asiatic biennial, 1 to 3 feet tall. The basal leaves are oblong or inversely egg-shaped, 1½ to 4 inches long, stalked on petioles nearly as long. The stem leaves are narrower, lance-shaped or linear, stalkless, with two narrow earlike lobes at the base. The flowers are small, to ⅛ inch long and yellow, clustered at the end of the stem in a broad and loose panicle. The fruits are capsular, flat, firm, oblong, ½ to ¾ inch long and about ⅓ as wide. At first they are erect, later pendulous, tapering to the base, truncate or notched at the apex, becoming dark purple at maturity. They are one-celled and contain a single seed which hangs from the top of the capsule.

Woad was formerly much cultivated in Great Britain for a blue dye extracted from its mashed, fermented leaves. Eventually it was superseded by indigo. It is still cultivated in some parts of Europe and is said to improve the quality and color of indigo when mixed with it.

In the United States woad blooms in early summer and fruits from June to October. In the Levant, where it inhabits the mountains, its flowers appear in March and April. It is sometimes called asp-of-Jerusalem or Marlahan mustard.

HAROLD N. MOLDENKE.

WOBURN, wō'bŕn, city, Massachusetts, in Middlesex County, 10 miles northwest of Boston. The city is an industrial and residential center, with manufactures of leather and leather-working machinery, tools, gears, lathes, and chemicals, and electronics research and development laboratories. Market gardening is carried on in the vicinity. Woburn was the birthplace of the world-famous scientist Benjamin Thompson (q.v., 1753-1814), better known as Count Rumford; the house is open to the public. Also born here were the engineer and horticulturist Loammi Baldwin (q.v., 1745-1807), for whom the Baldwin apple is named, and his son Loammi (1780-1838), who has been called the father of civil engineering in the United States. The Baldwin homestead still stands in North Woburn but is not open to the public. The process of vulcanizing rubber was discovered by Charles Goodyear in Woburn in 1839.

First settled as part of Charlestown in 1640, Woburn was incorporated as a separate township in 1642 and as a city in 1889. It was named after Woburn in Bedfordshire, England. Government is by mayor and council. Pop. 35,943.

THOMAS H. MCGOWAN.

WODEHOUSE, wōd'hous, P(elham) G(renville), English novelist and humorist; b. Guildford, Sur-

rey, England, Oct. 15, 1881; d. Southampton, N. Y., Feb. 14, 1975. He was knighted in January 1975. After graduating from Dulwich College in 1900 he became a newspaperman in London. His first stories showed skill in creating absurd situations. Psmith, his first comic character, was created in 1910, but his most characteristic work began in 1924 with the publication of *The Inimitable Jeeves*, featuring that perfect valet and his employer, Bertie Wooster of the Drones Club. Mr. Mulliner, relater of tall tales about the aristocracy, appeared three years later. The absent-minded Lord Emsworth of Blandings Castle (1935) completed the cast of major characters who thenceforth marched and countermarched through a succession of delightful novels and stories published by Wodehouse.

Wodehouse was one of the few British writers who could use American English and characters convincingly. In addition to his humorous novels and stories, he collaborated with Guy Bolton in writing the books for several popular Broadway musicals, notably *Sally* (1920), *Sitting Pretty* (1924), *Anything Goes* (1934), and *Bring on the Girls* (1953).

Many of Wodehouse's memorable stories were collected and reprinted in *The Weekend Wodehouse* (1951) and in *The Most of P. G. Wodehouse* (1960). He wrote whimsically of his life and career in *Performing Flea* (1951) and *Over Seventy* (1957).

WODEN or WODAN. See ODIN.

WOESTIJNE, vōös-tī'nə, Karel van de, Belgian-Flemish poet, novelist, and essayist; b. Ghent, Belgium, March 10, 1878; d. Zwijnaarde, Aug. 24, 1929. A distinguished contributor to the literary periodical *Van nu en straks*, he opposed the popular Flemish regional literature and advocated an aristocratic individualism. In prose narratives such as *Het Vaderhuis* (1903), *Christophorus* (1926) and in verse, both rich in nature symbolism, he sought God and upheld the ideals of the spirit as opposed to the senses. His essays deal with Flemish, Dutch, and French poetry, painting, and sculpture. As a devotee of French culture, professor of the Flemish language in Ghent (from 1919), and member of the Royal Flemish Academy, he had a marked influence upon his generation.

EDWIN H. ZEYDEL.

WOFFINGTON, wōf'ing-tən, Margaret (known as PEG WOFFINGTON), Irish actress; b. Dublin, Ireland, Oct. 18, 1714; d. London, England, March 28, 1760. She first appeared on the stage in Dublin in a children's production of *The Beggar's Opera*, a role which attracted attention and launched her career as an actress. Her playing, in 1740, of Sir Harry Wildair in *The Constant Couple* brought an offer from Covent Garden in London, where she played opposite David Garrick in many famous roles, often impersonating men or fashionable women, and was openly acknowledged as his mistress. On May 3, 1757, she collapsed during a performance and, amid great applause, left the stage, never to return.

Peg Woffington was at her best when cast as an elegant lady of rank, but the audiences preferred her male impersonations. She seldom missed a performance, even if ill, and she gladly accepted secondary parts. Contemporary records reveal her as a kind person who was liked by

almost everyone except rival actresses, one of whom she stabbed during a performance.

DONALD B. CLARK.

WOFFORD COLLEGE, wŏf'ord, a liberal arts college for men, located in Spartanburg, S.C. It was founded in 1851 with a legacy left by Benjamin Wofford, a Methodist minister; first instruction was given in 1854. The college, which is largely supported by the Methodist Church, confers bachelor of arts and bachelor of science degrees. The library of 72,000 volumes has a special collection on the history of Methodism in the United States and South Carolina. School teams are known as the "Terriers," and the colors are old gold and black. Average annual enrollment is 800.

KELLER COGSWELL.

WÖHLER, vŭ'lər, Friedrich, German chemist: b. Eschersheim, Germany, July 31, 1800; d. Göttingen, Sept. 23, 1882. He began to study medicine in 1820 at Marburg and transferred in 1821 to Heidelberg, where under the influence of Leopold Gmelin he turned his attention to chemistry. After receiving his doctor's degree in medicine, surgery, and obstetrics in 1823, he studied for a year in Stockholm with Jöns Jakob Berzelius, with whom he maintained a long correspondence that was published posthumously. Wöhler taught at technical schools in Berlin and Kassel and in 1836 became professor of chemistry on the medical faculty of the University of Göttingen, where he remained until his death, winning worldwide esteem as an educator. A monument erected in his honor at Göttingen memorializes the service to chemistry of a man who never received formal education in the science.

Wöhler has been credited with beginning the science of organic chemistry. His synthesis of urea from ammonium cyanate in 1828 refuted the prevailing theory that a "vital force" is necessary for the formation of organic compounds. He was among the first to study isomerism. With Justus von Liebig, he investigated oil of bitter almonds and discovered that the benzoyl radical remained the same in each of a series of compounds of the same composition. His other work in organic chemistry included the discovery of amygdalin in 1837 and of hydroquinone in 1848. His work in inorganic chemistry included studies of most known elements. Wöhler was the first to isolate beryllium, which he named, in 1828, and he isolated pure metallic aluminum for the first time in 1845, after having isolated an impure aluminum powder in 1827. In 1862 he prepared calcium carbide. He devised a process for the large-scale manufacture of nickel, and his work on silicon was vital to the development of silicon chemistry. Wöhler was the author of *Grundriss der anorganischen Chemie* (1831), *Grundriss der organischen Chemie* (1840), and more than 300 scientific papers.

WOHLGEMUTH, Michael. See WOLGEMUT, MICHEL.

WOLCOTT, wŏl'kət, an American family prominent in Connecticut and national affairs during the colonial and early national periods.

ROGER WOLCOTT: b. Windsor, Conn., Jan. 4, 1679; d. East Windsor, May 17, 1767. Typical of his generation, he was educated at home and was apprenticed to a trade. He became a successful clothier and farmer, was admitted to the bar, and

was the father of 15 children. In 1710 he was made a justice of the peace and then advanced through the court system to become chief justice of Hartford County in 1741. He was also a member of the colony's legislature during most of these years. Finally, he was chosen deputy governor (1741-1750) and governor (1750-1754). Wolcott's military career was similarly successful, from his first service in 1711 as commissary in Queen Anne's War to his leadership as major general under William Pepperrell in the brilliant siege and capture of Louisbourg on Cape Breton Island, Canada, in 1745. His later years were spent in defending the Congregational system of church government. Wolcott's *Poetical Meditations, Being the Improvement of Some Vacant Hours* (1725) was the first book of verse published in Connecticut.

OLIVER WOLCOTT, signer of the Declaration of Independence: b. Windsor, Conn., Nov. 20, 1726; d. Litchfield, Dec. 1, 1797. Son of the preceding, he graduated at the head of the class of 1747 at Yale and was given command of a New York company in the projected attack on French Canada. After the peace treaty of 1748, he returned to Connecticut and in 1751 helped to organize the frontier county of Litchfield, which he served as sheriff for the next 20 years. He also represented Litchfield in the colony's legislature and was a probate judge, county court judge, and officer in the colonial militia. In 1775 he helped to negotiate the neutrality of the pro-British Six Nations Indians and later that year was elected to the Continental Congress, where he served throughout the Revolutionary War, except for a short period in 1779. Because of illness he was unable to sign the Declaration of Independence until November 1776. In the summer of 1776, under Gen. Israel Putnam, Wolcott commanded 14 regiments of militia in the Hudson River valley, and the following year his troops fought together with Gen. Horatio Gates against the army of Gen. John Burgoyne in the Battle of Saratoga. In 1779 he was in charge of the defense of the Connecticut coast against British raids. He also helped to conclude the Treaty of Fort Stanwix (1784) with the Six Nations Indians. He was lieutenant governor (1787-1796) and governor of Connecticut (1796-1797).

OLIVER WOLCOTT: b. Litchfield, Conn., Jan. 17, 1760; d. New York, N.Y., June 1, 1833. Son of the preceding, he graduated from Yale in 1778, served briefly in the Revolutionary Army, and was admitted to the bar in 1781. He first attracted attention as a specialist in public finance for his work in the settlement of the financial dispute between Connecticut and the federal government in 1784. After serving briefly (1788-1789) as comptroller of accounts for Connecticut, he was named auditor (1789-1791) and then comptroller (1791-1795) of the United States and was a vigorous proponent of Alexander Hamilton's financial program. When Hamilton resigned from the cabinet, Wolcott became secretary of the treasury (Feb. 2, 1795), defending his increasingly unpopular financial program against the attacks of the Jeffersonians. He was kept in office by John Adams, but during the election campaign of 1800, he joined Hamilton in an intrigue against Adams' reelection, and was forced to resign from the cabinet. Wolcott was one of the "Midnight Judges" that Adams appointed to the United States Circuit Court in 1801, but the Democratic-Republican Congress eliminated his

position in 1802. He then turned to commerce and built up a prosperous mercantile business in New York City.

Reentering political life during the War of 1812 as a "War Federalist," he helped to organize (1816) the Toleration Party, a coalition of liberal Federalists and Democratic-Republicans in Connecticut, and was elected governor of the state for several terms (1817-1827). In 1818 he presided over the constitutional convention which adopted a sweeping reform constitution to replace the charter of 1662.

DAVID ALAN WILLIAMS,
Assistant Professor of History, University of
Virginia.

WOLCOTT, town, Connecticut, in New Haven County, five miles northeast of Waterbury. It has a hilly terrain with many steep slopes. The Mad River and its tributaries comprise the town's major surface drainage system. Although its industrial history began as early as 1760 with a grist-mill, no major industrial development ever occurred. Other than agriculture, Wolcott's principal industries are the manufacture of tools and novelties.

Settled permanently in 1731, the area was originally called Farmingbury, a part of the towns of Southington and Waterbury. It was incorporated separately in 1796 and named after Connecticut's governor, Oliver Wolcott. Wolcott was the birthplace of Amos Bronson Alcott (q.v.), father of the famous author Louisa May Alcott, and Seth Thomas (1785-1859), who was a noted clock manufacturer. The town government is of the form that is known as the selectmen-town meeting. Population: 13,700.

ROBERT C. SALE.

WOLD, wöld, a term used in England to denote an elevated range of open country, based on chalk or limestone. The Yorkshire Wolds and the Lincolnshire Wolds are parts of a single range divided long ago by the river Humber as it made its way to the North Sea. They are remnants of the great system of chalk ranges spreading out from southern England and including the North and South Downs of Kent and Sussex, the Chiltern Hills of Buckinghamshire, and the Cotswolds—all very much alike in character. The Lincolnshire Wolds run generally northwest for some 45 miles from near the coast of the Wash to the Humber, with an average width of 10 miles and 300 to 400 feet in height. Beyond the Humber they are continued by the Yorkshire Wolds, which at first run northwest and then bear east to end in the high cliffs of Flamborough Head. Their greatest width is about 20 miles and their maximum height 800 feet.

H. GORDON STOKES.

WOLF, Christian von. See WOLFF, BARON CHRISTIAN VON.

WOLF, völf, Friedrich August, German classical philologist: b. near Nordhausen, Germany, Feb. 15, 1759; d. Marseille, France, Aug. 8, 1824. He studied at the University of Göttingen and in 1782 became rector of the *Stadtschule* in Osterode am Harz. A year later he was professor of philosophy and pedagogy at the University of Halle, remaining there until the institution was suppressed in 1807 during the Napoleonic invasion. He was extremely active as a teacher, lecturer,

and critic and was editor and translator of numerous Greek and Latin classics. Wolf's most famous work, *Prolegomena ad Homerum* (1795), was a landmark in Homeric scholarship and long remained the basis for theories about the authorship of the Homeric poems, as well as other epics such as the *Nibelungenlied*. Wolf contended that the *Iliad* and *Odyssey* were not composed by one poet but by several rhapsodists; some aspects of his thesis (particularly the effect that reduction to writing has on oral tradition) are still valid. In Berlin he finished his most comprehensive study of antiquity, *Darstellung der Altertumswissenschaft* (1807), and was one of the founders of the university there. He was an advocate of classical studies as a mental and cultural discipline and pioneered the science of philology, not in a narrow linguistic sense, but as a means of broadening man's knowledge of human nature as exemplified in antiquity.

EDWIN H. ZEYDEL.

WOLF, Hugo, Austrian composer: b. Windischgraz, Austria (now Slovenjgradec, Yugoslavia), March 13, 1860; d. Vienna, Feb. 22, 1903. His fame rests almost entirely upon his approximately 300 solo songs with piano accompaniment, which entitle him to a high position in the line of Schubert, Schumann, Brahms, and Richard Strauss. An unhappy, irascible, psychotic, and finally deranged man, he found daily life extremely difficult, and became involved in highly publicized, unhappy encounters with Wagner, Brahms, and his former fellow student Gustav Mahler; he also fell foul of the most influential music critic of his era, Eduard Hanslick.

After a stormy childhood education, Wolf became a student at the Vienna Conservatory in 1875 but was expelled for insubordination in 1877. He earned a meager living from music lessons and began to compose songs to texts by such poets as Goethe, Nikolaus Lenau, and Heine. After an unsuccessful interlude in Salzburg as a chorus master, he became music critic of the *Wiener Salonblatt* in 1883, using its columns for personal vendettas, which won him many enemies, though he also attracted enthusiasts by his songs. He resigned from the paper in 1887 and thereafter devoted himself wholly to composition. His symphonic poem *Penthesilea*, after the tragedy by Heinrich von Kleist, was composed in 1883-1885; his *Italianische Serenade* was originally written for string quartet in 1887.

Wolf's fame spread after 1889, with publication of his songs to poems by Eduard Mörike, Joseph von Eichendorff, Goethe, Paul Heyse, Emanuel Geibel, and Gottfried Keller. He completed the 22 songs of the *Italianisches Liederbuch*, part 1, in 1891 and 24 songs of part 2 in five weeks in the spring of 1896.

Wolf labored long and painfully over *Der Corregidor*, an opera after Pedro Antonio de Alarcón's *El sombrero de tres picos*; it was heard for the first time at Mannheim on June 7, 1896, and has had numerous stagings since then, but without entering the active repertoire. *Der Corregidor* is couched largely in a curiously inept, unoperatic lieder style and is orchestrally indecisive. Wolf began, but never completed, a second Alarcón opera, *Manuel Venegas*. Societies for the performance of his songs were instituted at Berlin (1896) and Vienna (1897).

For some time, Wolf had showed alarming signs of mental instability brought on by venereal

disease. A disagreement with Mahler, the new director of the Vienna Opera, led to his mental breakdown, and he was placed in a sanatorium on Sept. 20, 1897. He recovered sufficiently to leave on Jan. 24, 1898, but then suffered a relapse, tried to commit suicide by drowning, and requested that he be put into a state asylum, where he declined gradually into complete insanity.

Wolf has probably never been excelled in creating songs that become great dramas in miniature by their telling and subtle combination (often wholly or partly contrapuntal) of piano accompaniment and a plastic, mercurial vocal line that is highly responsive to the suggestions contained in the text.

HERBERT WEINSTOCK,
Author of "Music as an Art."

WOLF, Max (in full MAXIMILIAN FRANZ JOSEPH CORNELIUS WOLF), German astronomer: b. Heidelberg, Germany, June 21, 1863; d. there, Oct. 3, 1932. Attracted to astronomy at an early age, he erected a small observatory where, in 1884, he discovered a comet which bears his name. He then gave up his theoretical interests to devote himself to observational astronomy and astronomical photography. In 1896 he became director of the astrophysical observatory at Königstuhl and in 1901 was appointed to the chair of astronomy and geophysics at the University of Heidelberg, where he remained for the rest of his life.

On Dec. 22, 1891, Wolf discovered the first photographic asteroid (No. 323), for which he was awarded the Lalande Prize of the Paris Academy of Sciences. Eventually he found over 100 such asteroids. Perhaps his greatest contribution to astronomy was his study of the Milky Way and its nebulae. In 1902 he published a catalogue of 1,528 nebulae and about the same time was the first to use the stereocomparator for the discovery of stars with large proper motion by scanning celestial photographs.

I. M. LEVITT.

WOLF, Rudolf, Swiss astronomer: b. Fällanden, near Zurich, Switzerland, July 7, 1816; d. Zurich, Dec. 6, 1893. Director of the Bern Observatory (1847) and later the Zurich Observatory (1855), he is best known for his unrivaled historical knowledge of sunspots. In 1852 he discovered independently the coincidence of the sunspot period with terrestrial magnetic field disturbances. At

this time he also corrected Samuel Heinrich Schwabe's determination of the sunspot period from about 10 years to the more nearly correct period of 11.1 years. From a study of the Zurich Chronicles (1000-1800 A.D.) Wolf derived evidence that the aurorae were also related to the sunspot cycle. He also wrote extensively on the history of science.

See also SUN—Sunspot Cycles.

I. M. LEVITT.

WOLF, wŏlf, the largest wild member of the dog family (Canidae). The gray wolf (*Canis lupus*), or timber wolf, originally had a huge range in North America from Alaska and the Arctic islands to the Mexican tableland, and in Eurasia south to the Mediterranean and parts of India and China. In various local races, it may live in snow and ice or tundra, in forests and woodlands, or in deserts. A smaller red wolf (*C. niger*) is native from Texas to Florida.

Adult gray wolves are 48 to 59 inches long in head and body and stand 33 to 38 inches at the shoulder, with a tail 16 or 17 inches long. Many weigh 50 to 100 pounds, and there is a 175-pound Alaska record. The coat is thick and durable and shows great individual variation in color, from nearly white through gray, rufous, and dusky to pure black; members of one litter may be of several colors. The neck hair is long and erectile.

Wolves trot or gallop, with ears erect, and have both speed and endurance. Commonly they hunt in pairs or packs and are clever in catching small prey or bringing down large hoofed animals. Where undisturbed, they have irregular circuits, 20 to 60 miles in diameter, which they cover every few days. The commonest call is a long, loud, throaty howl.

Adults breed first when 2 to 3 years old; gestation is about 63 days; litters, averaging 7, are born mostly in May. The young are reared in a den, which is either a natural cavity or an enlarged burrow, commonly on a hillside or bluff, often with a narrow entrance and sometimes 30 feet deep. The parents hunt mostly at night, either bolting down flesh from a kill and disgorging it on their return to the den entrance or dragging parts of carcasses to the site. Later the family lives outdoors, often along a hunting route, roughly circular, 20 to 60 miles in diameter, traversed at intervals.

Wolves are strictly carnivorous, feeding pref-

Timber wolf, or gray wolf (*Canis lupus*).

Tom McHugh from National Audubon Society

erably on freshly killed animals, from large birds or rabbits to deer or caribou, although they will eat carrion. Like other canines, they can survive without food for several days and then may gorge up to one fifth of their body weight at a meal. Packs of wolves formerly preyed on herds of bison on the Great Plains of North America; introduction of domestic livestock brought them an added food supply. Horses, cattle, sheep, and pigs are still killed in remote areas.

Since civilization began, wolves have been a menace to man, his herds, and large game animals. In consequence, they have been destroyed by knife, gun, trap, and poison. The wolf was killed off in Great Britain by the 18th century and now is extinct or scarce in most of western Europe. The same is true of the United States and southern Canada, although a few survive in isolated spots. To the north they still are present.

The crafty character of the wolf has given rise to many superstitions and legends and much folklore, as for example the ancient Roman legend of Romulus and Remus (see ROMULUS AND REMUS) or Rudyard Kipling's story of Mowgli. In Europe during former centuries people were apparently attacked and killed by wolves; in early days in America, also, many were followed and some attacked, but there have been few or no authenticated human deaths there. Occasionally, woodsmen have reared wolf pups as somewhat uncertain pets and companions. Wolf pelts were once used for human garb, and wolf flesh is a human food in extremity.

Wild wolves occasionally mate with domestic dogs, and fertile hybrids result. Indeed, the breeds of dogs evidently all were derived from the wolf of Europe by centuries of selective breeding.

WOLF-FERRARI, vòlf' fàr-rà'rè, **Ermanno**, Italo-German composer: b. Venice, Italy, Jan. 12, 1876; d. there, Jan. 21, 1948. His father, August Wolf (1842-1915), was a well-known German painter; his mother was Italian. After studying art in Rome, he turned to music, becoming a pupil of Josef Rheinberger at Munich (1893-1895). His earliest large works to be produced, both to Italian texts, were an oratorio, *La Sulamite* (Venice, 1899) and an opera, *Cenerentola* (Venice, 1900). He was director of the Liceo Benedetto Marcello, Venice, from 1902 to 1907, then removed to Austria and Germany, teaching at the Mozarteum in Salzburg and residing near Munich. For many years thereafter, his operas, though in the tradition of *opera buffa* and conceived to Italian texts, were given premieres in German in Germany.

Wolf-Ferrari's first major successes, both to librettos derived from comedies by Carlo Goldoni, were *Die neugierigen Frauen* or *Le donne curiose* (Munich, 1903) and *Die vier Grobiane* or *I quattro rusteghi* (Munich, 1906). The most widely popular of his operas was *Susannens Geheimnis*

or *Il segreto di Susanna* (Munich, 1909). His next—and only tragic-opera, was *Der Schmock der Madonna* or *I gioielli della Madonna* (Berlin, 1911). Returning to comedy, but to less acclaim, he composed, among others, *Der Liebhaber als Arzt* or *L'amore medico* (Dresden, 1913), after Molière's *L'amour médecin*, and—staged first in Italian in Italy, to which he turned increasingly after World War I—*Gli amanti sposi*, again after Goldoni (Venice, 1925); *Sly*, after Shakespeare's *The Taming of the Shrew* (Milan, 1927); two more Goldoni-based scores—*La vedova scaltra* (Rome, 1931) and *Il campiello* (Milan, 1936); and *La dama boba*, after Lope de Vega (Milan, 1939). Although his operas have largely fallen out of the repertoire, the best of his comedies always respond well to revival.

HERBERT WEINSTOCK

Author of "Music as an Art"

WOLFE, wòlf, **Charles**, Irish clergyman and poet: b. Dublin, Ireland, Dec. 14, 1791; d. Cove of Cork (now Cobh), Feb. 21, 1823. He graduated B.A. from Trinity College, Dublin, in 1814, tutored there for a year, took Anglican orders, and served as curate in Ulster from 1818 to 1821. His poetical *Remains* was published posthumously in 1825, with a brief memoir by John A. Russell. Wolfe's single memorable work is *The Burial of Sir John Moore*, a poem published in the *Newry Telegraph* in 1817, eight years after the event it commemorates. Moore was mortally wounded in action with the French outside La Coruña, Spain, on Jan. 16, 1809, after saving his army by one of the most brilliant and most desperate retreats in British military history. Wolfe's poem is worthy of its subject.

DELANCEY FERGUSON

WOLFE, **James**, English general: b. Westerham, Kent, England, Jan. 2, 1727; d. Quebec, Canada, Sept. 13, 1759. The son of Gen. Edward Wolfe (1685-1759), he was commissioned in the Royal Marines in late 1741. He fought with distinction at Dettingen (1743) in the War of the Austrian Succession and later at Falkirk and Culloden Moor (1746) in the Jacobite rebellion. His efficient staff work in the unsuccessful expedition against Rochefort, France (1757), brought him to the attention of William Pitt, who sent him with Jeffrey Amherst to attack Louisbourg, Nova Scotia, in the French and Indian War. The capture of Louisbourg (July 26, 1758) made his name a household word. Young as Wolfe was, Pitt selected him to command the attack on Quebec and promoted him major general. Aided by Adm. Charles Saunders, Wolfe approached Quebec at the end of June 1759. On July 31 the British were repulsed by a stout French defense at Montmorency. Although there was disagreement on the conduct of the campaign between Wolfe and his brigadiers—Robert Monckton, George Townshend, and James Murray—they agreed on the attack of September 13 on the Plains of Abraham. The French were taken by surprise and routed, but Wolfe was mortally wounded. Quebec surrendered on September 18. Although he had his share of luck, his exploit at Quebec was brilliant in the extreme. Next to Lord Amherst, Wolfe played the principal command role in the conquest of Canada from the French. See also CANADA—44. *Canada in the Reorganization of North America: 1752-1763.*

CYRIL FALLS

WOLFE, Thomas (Clayton), American novelist: b. Asheville, N.C., Oct. 3, 1900; d. Baltimore, Md., Sept. 15, 1938. His father, a stonecutter, and his mother, a boardinghouse keeper and real-estate speculator, along with other members of the Wolfe family, were the matrix of his famous first novel, *Look Homeward, Angel: a Story of the Buried Life* (1929). At the University of North Carolina (A.B., 1920) and at Harvard (M.A., 1922), he specialized in playwriting; his early and frustrated ambition was to become a successful playwright.

Thomas Wolfe

Culver Service

Wolfe continued his playwriting in New York City during the mid-1920's, and one of his scripts, submitted to the Neighborhood Playhouse, caught the attention of Aline Bernstein, a talented stage and costume designer who became a dominant influence in his life and work. During these years he wrote *Look Homeward, Angel* and dedicated it to her. The massive manuscript of a rebellious, bitter Southern childhood also caught the attention of Maxwell Perkins, an editor at Scribner's, with whom Wolfe formed the second of the two strong relationships of his adult years. This first novel, published on the eve of the stock-market crash and nationwide depression, was praised and attacked with equal force. It created consternation in Asheville. But there was no doubt that the novel—romantic and rebellious, poetic and satiric, presenting a remarkable picture of a Southern family and a truthful, hard view of a Southern town—marked the emergence of a major talent in American fiction.

Yet Wolfe's troubles had not ended; they had, indeed, hardly begun in a career marked always by turbulence and torment. Since 1924 he had been teaching English at New York University, which he describes in his second novel as the "School for Utility Cultures." He gave up teaching in 1930 and with the aid of a Guggenheim Fellowship was able to travel and live abroad. He wrote literally hundreds of thousands of words for his new novel and discarded a "finished" manuscript on the advice of Perkins. Finally, after Wolfe had worked on it for six years and was still in the midst of "revisions," Perkins sent off, despite the author's protests, the manuscript for *Of Time and the River* (1935). These experiences, too, Wolfe describes in *The Story of a Novel* (1936), an illuminating description of the creative processes.

Wolfe's final two novels were published posthumously. *The Web and the Rock* (1939), his third novel, described with remarkable candor and intensity his experiences with Mrs. Bern-

stein. *You Can't Go Home Again* (1940) continued what was in effect the harrowing saga of Wolfe's autobiography. But these volumes were major fiction, too, and contained brilliant and memorable descriptions of New York society, of Brooklyn in the great economic depression, and of "Altamont" or "Libya Hill" (Asheville) and the South. In his own tortured, groping, stubborn, provincial way, Wolfe had emerged as one of the notable social realists and satirists of his period just when his early and untimely death cut off his career. Other works include two volumes of excellent stories, *From Death to Morning* (1935) and *The Hills Beyond* (1941). *Thomas Wolfe's Letters to His Mother* (1943) was edited by John Terry; *The Letters of Thomas Wolfe* (1956) was edited by Elizabeth Nowell. A popular and sentimental play version of *Look Homeward, Angel*, by Ketty Fring, was produced on Broadway in 1957, an ironic epitaph to Wolfe's own theatrical aspirations.

WOLFE ISLAND, island, Ontario, Canada, in Frontenac County, at the entrance of the St. Lawrence River at the northeastern end of Lake Ontario, between Cape Vincent, N.Y., and Kingston, Ontario. The largest (49 square miles) of the Thousand Islands, it was originally called Grande Isle, but in 1792 was renamed in honor of Gen. James Wolfe (q.v.). It is primarily a resort area. Marysville is the chief community.

WOLFENBÜTTEL, vól'fən-büt-əl, city, Germany, in the State of Lower Saxony, on the Oker River, seven miles south of Brunswick. It has some small canning, chemical, and machine-building plants, but otherwise is largely residential. The most famous edifice is the Ducal Library, built in 1690 and administered by the philosopher and mathematician Gottfried von Leibniz until 1716; from 1770 to 1781 its librarian was the dramatist Gotthold Lessing. The library contains about 400,000 volumes, with a valuable collection of 4,000 incunabula and 8,000 manuscripts. In Wolfenbüttel are the Lessing Theater and the house where Lessing wrote *Nathan der Weise*. There are many 17th century houses and buildings of timber-and-masonry construction, including the town hall (1600).

First mentioned in 1118, Wolfenbüttel grew around a castle built in 1283. From 1432 to 1753 the dukes of Brunswick-Wolfenbüttel made their residence here, occupying a palace which still stands and includes the remains of the old castle. The town was given the name of Heinrichstadt in 1570; this and nearby settlements were amalgamated as the city of Wolfenbüttel in 1747. After World War II, the city was included in the Federal Republic of Germany (West Germany). Pop. (1980) 50,256.

WOLFF, vól'f, **Casper Friedrich**, German anatomist and comparative embryologist: b. Berlin, Germany, 1733; d. St. Petersburg (now Leningrad), Russia, Feb. 22, 1794. The son of a tailor of modest means, he studied anatomy and physiology at the University of Berlin and earned his doctorate in medicine at the University of Halle. Following a tour of medical service in Silesia during the Seven Years' War, he lectured in Berlin, effectively combining the methods of logic with the science of medicine. His provocative doctoral thesis, *Theoria generationis* (1759), demonstrated a structural basis for epigenesis in both plants and animals, but aroused such stiffing opposition among contemporary preformationists, including the eminent Albrecht von Haller and Charles Bonnet, that Wolff was unable to become established in Germany. His work remained unrecognized for approximately 50 years.

Meanwhile, upon the invitation of Catherine the Great, Wolff accepted an appointment (1767) in the Academy of Sciences at St. Petersburg, where he spent his remaining years, which were highly productive in spite of the optical limits of the microscopes available in his time. He observed the undifferentiated nature of the growing points of root and shoot in higher plants and considered aerial parts of the plant except the stem to be modified leaves. He also described the mesonephric kidney. His monograph on the development of the chick intestine, *De formatione intestinorum* (1768), set a standard for careful observation. In this work he initiated the idea of leaflike embryonic layers, a concept subsequently enlarged into the germ layer theory by the 19th century embryologists Christian Heinrich Pander and Karl Ernst von Baer.

E. W. LOWRANCE,
Professor of Anatomy, School of Medicine, University of Missouri.

WOLFF or **WOLF**, **Baron Christian von**, German philosopher: b. Breslau (Pol. Wrocław), Germany, Jan. 24, 1679; d. Halle, April 9, 1754. He studied at Jena and Leipzig, and in 1706 became professor of mathematics and natural science at the University of Halle. His rationalist views incurred the opposition of Pietist theologians, and in 1723 he was dismissed from his post and banished from Prussia. After teaching for several years at Marburg, he was recalled to Halle by Frederick the Great in 1740 and became chancellor of the university in 1743.

A leading figure of the German enlightenment, Wolff sought to apply the principles of preceding rationalist thinkers, particularly Gottfried von Leibniz, to metaphysics, moral philosophy, and psychology, as well as to the natural sciences, jurisprudence, and other largely empirical disciplines. Wolff, however, lacked the speculative depth of his great predecessors, and his rationalism became a dry and often superficial formalism. Although the Wolffian approach dominated German intellectual circles until the emergence of Immanuel Kant's critical philosophy, his chief importance was as a systematizer and as a popularizer of enlightenment. He was to a large extent the originator of a German philosophical vocabulary, and his comprehensive efforts in various fields laid the groundwork for a distinctively German philosophy.

WOLFFISH, wól'f'fish, a fish (*Anarchichas lupus*) of the family Anarchichadidae. This solitary fish is found on both sides of the North Atlantic—from Spitsbergen to France, in Iceland and Greenland, and south to Cape Cod and possibly Cape Hatteras. It is the largest of several species of this family in the North Atlantic. A related genus, *Anarchichthys ocellatus* is the wolf eel of the North Pacific.

Wolffish (*Anarchichas lupus*)

The wolffish has very strong, prominent canine teeth in the front of the jaws, and a double row of molars on the sides; palatine, vomerine, and pharyngeal teeth are also present. The snout is rounded. The long dorsal and anal fins reach to the caudal peduncle. There are no pelvics. Scales are rudimentary. The wolffish is bluish gray with dark bands. It reaches 30 pounds and a length of some 5 feet. In winter it deposits ball-like clusters of large eggs. It eats crustaceans and mollusks.

The wolffish is also known as the sea wolf or sea cat. It has a reputation for ferocity, although that may have more to do with its appearance than its actual behavior.

CHRISTOPHER W. COATES.

WOLFHOUND, wól'f'hound, a general term for such breeds of dogs as the Irish wolfhound, the borzoi (Russian wolfhound), the Scottish deerhound, and other large dogs that have been used to hunt wolves or big animal game. They have several characteristics in common—large size, great strength, speed, and stamina. Of the Irish wolfhound it has been said that its success was nearly its ruin, for when wolves disappeared from Ireland, the Irish wolfhound almost did so, too. See also DOG—*Sporting Dog (Hound) Group*.

WILLIAM F. BROWN.

WOLFRAM. See TUNGSTEN.

WOLFRAM VON ESCHENBACH, vól'främ fôn ésh'an-bäkh, German poet: b. Eschenbach (now Wolframs-Eschenbach), near Ansbach, Franconia, Germany, c. 1170; d. probably there, c. 1220. His position as a *ministerialis* (landless knight) compelled him to seek the support of patrons, of whom the best known was Landgrave Hermann I of Thuringia. Wolfram spent considerable periods between 1200 and 1220 at Hermann's court at Eisenach, where he seems to have met other literary figures of the period. He is principally known for his long narrative poem *Parzival* (q.v.). His other two narrative works, *Titurel* (or *Sigune und Schionatulander*) and *Willehalm*,

are incomplete. He also wrote seven or eight formal love songs (*Minnelieder*), among them some highly imaginative *Tagelieder* (dawn songs), in which he treats the conventional theme of the parting of lovers at dawn with irony and verbal brilliance. All Wolfram's narrative works are distinguished by a deep interest in morality, a wide tolerance, an individual style, and a fine sense of humor. The unique quality of his imagination nearly outdistances the medium of medieval lyric poetry.

Parzival is the best of his works and ranks with the greatest imaginative poems in world literature. In spite of Wolfram's own denial, it can be shown that his *Parzival* is based on the incomplete *Perceval* of Chrétien de Troyes, but a great deal has been added either from sources no longer extant or from the poet's own imagination. Wolfram adds a long prologue about Cahmuret, Parzival's father, and names other persons not known to Chrétien. The marriage of Cahmuret to Belakane, a pagan Negro, by whom he has a son Feirefiz, enables Wolfram to exploit one of his favorite themes, the essential nobility of many pagans, and by implication to plead for tolerance for them. Parzival's search for the Grail, which in Wolfram's version is a precious stone possessing the properties of a horn of plenty and the fountain of youth, represents man's search for an ideal to live by, and for true religion. It is not an allegory or novel of the education of a Christian man, but rather an account of a great man attaining great ends when he learns that humility and trust in God are essential to his success. The social significance of a group of men devoted to an ideal and pursuing their goal under a specially chosen leader is also stressed.

In spite of many efforts, it is hard to formulate Wolfram's religious ideas with any exactness. It has even been said that he was a Catharist (Albigensian) heretic, but there is no real proof of this. His other major work, *Willehalm*, would seem to demonstrate the opposite. *Willehalm* was written later than *Parzival*, between 1212 and 1220. Wolfram says that he used as a source a copy of the poem *La bataille d'Aleschans* provided by Hermann of Thuringia, but careful study has made it clear that he actually combined elements from several of the poems from the *chanson de geste* cycle of Guillaume d'Orange, although the main story is derived from the *Aleschans* and *Li covenans Vivien*. Whatever his exact sources may have been, Wolfram changed the character of the poem by concentrating interest on the ideas of martyrdom and sainthood and the fundamental conflict between Christian and pagan. The pagans are represented as noble and moral persons, but the ends for which they fight, principally earthly love, are not so lofty as those of the Christians. *Willehalm* is not so commanding a figure as Parzival, but Gyburg, his wife, is one of the noblest female figures in literature. *Willehalm* had won her when she was already the bride of a pagan, Tybalt, and the conflict between the Christians and pagans originally began with efforts to win her back. After her marriage and her conversion to Christianity she remains utterly faithful to *Willehalm*.

Wolfram's other fragment, *Titarel*, deals with the earlier history of Parzival and Sigune, two of the characters in *Parzival*, and is of less importance than his other works. *Titarel* was Wolfram's last work. He is assumed to have died before completing it.

W. T. H. JACKSON,
Professor of German, Columbia University.

WOLFRAMITE, wŏl'frā-mīt, a mineral composed of ferrous and manganous tungstates (Fe,Mn)WO₄, important as an ore of tungsten. Wolframite is also the name given to a group of minerals which constitute an isomorphous series. Minerals of the wolframite group are composed of ferrous tungstate and manganous tungstate in varying proportions; ferberite, FeWO₄, represents one end of the series and huebnerite, MnWO₄, the other. Wolframite often refer to the minerals in the series which have an intermediate composition—more than 20 percent of one tungstate and less than 80 percent of the other.

Minerals in the wolframite group are dark in color, ranging from brown (huebnerite) to black (ferberite); hence they have been called "black ore." They occur as monoclinic crystals, distinguished by perfect cleavage in one direction and by a high specific gravity, about 7.0 to 7.5. They are brittle and have a hardness rating of 5.0-5.5 on the Mohs scale. Wolframite minerals usually occur in quartz veins, associated with granite rocks and are often found with cassiterite and scheelite. Most of the wolframite production in the United States comes from the states of Colorado, Idaho, and North Carolina.

SANDRA LESSER.

WOLFSBANE. See ACONITE.

WOLFSBURG, wŏlfs'boŏrkH, city, Germany, in the State of Lower Saxony, on the Aller River, 16 miles northeast of Brunswick. It was founded in 1938 as the site of the Volkswagen automobile plant and experienced a rapid growth with the expansion of this industry and the influx of refugees from East Germany after 1945.

An outstanding architectural feature is the modern-styled Cultural Center, finished in marble and copper, designed by the noted Finnish architect Alvar Aalto, and opened in 1962. The city was included in the Federal Republic of Germany (West Germany) after World War II. Pop. (1983) 124,609.

WOLFFVILLE, wŏl'f'vīl, town, Nova Scotia, Canada, on the south shore of Minas Basin, at the mouth of the Cornwallis River, about 65 miles northwest of Halifax. It is three miles from Grand Pré, made famous by Henry Wadsworth Longfellow's *Evangeline*, and a convenient center for visits to Cape Blomidon, Cape Split, the Gasperau Valley, and Evangeline Beach, which offers unusually warm saltwater bathing. The surrounding district is devoted to fruit growing, mixed farming, and dairying. Acadia University (q.v.) is situated in Wolfville.

Settled in 1760-1761 by New England planters, chiefly from Connecticut, the place was first known as Horton, then Central Horton, and, for a brief period, Mud Creek. It was given its present name about 1840 in honor of the DeWolfe family and incorporated as a town in 1893. Cleveland House is maintained as a museum by the Wolfville Historical Society. Population: 3,235.

WALTER J. KONTAK.

WOLGAST, wŏl'gäst, town, Germany, on the estuary of the Peene River where it enters the Baltic Sea opposite the island of Usedom, 16 miles east of Greifswald. The town has a few plants making

agricultural tools, some small iron forges, and wood manufacturing. Wolgast received its city charter in 1282 and was the seat of the dukes of Pomerania-Wolgast from 1295 to 1625. During the Thirty Years' War, the Austrians under Albrecht von Wallenstein captured the fortress (1628), and the Swedes occupied it in 1630 and 1638. It was awarded to Prussia in 1815. After World War II, it was included in the German Democratic Republic (East Germany), from 1952 in the district of Rostock. Pop. (1957) 13,964.

WOLGEMUT or **WOHLGEMUTH**, wŏl'gə-mōŭt, **Michel**, German painter and wood engraver: b. Nürnberg, Germany, 1434; d. there, Nov. 30, 1519. Having one of the busiest studios in southern Germany, he attracted many young artists, including Albrecht Dürer, who studied with him from 1486 to 1490. This fact has added luster to his name, but how important a painter he was in his own right is not at present entirely clear. Pictures formerly attributed to him are now given to his teacher Hans Pleydenwurff (whose widow Wolgemut married), to his stepson Wilhelm Pleydenwurff, and even to Dürer himself. The Zwickau altarpiece has remained solidly in the Wolgemut column, but the wonderful Hof altarpiece, now at Munich, has been assigned to the elder Pleydenwurff; and while the Zwickau work is vigorous and noteworthy for its careful detail, the Hof masterpiece has a grandeur and quiet lyricism that cannot be found in the other composition. What remains certain is that Wolgemut ran his large studio with a flair for business and art combined, carrying out all sorts of commissions. His 650 engravings for the Nürnberg chronicle influenced Dürer.

WALLACE BROCKWAY.

WOLIN, wŏl'ĕn (Ger. **WOLLIN**), town, Poland, in Szczecin Province, on the Dievenow arm of the Oder River, 30 miles north of the city of Szczecin (Stettin). It is a small fishing port in the southern part of Wolin Island (95 square miles), which lies between the Dievenow and the Baltic Sea. The old Wendish trading post of Vineta (Julin, Jummeta, and Jomsburg) is supposed to have been located here and destroyed by the Danes in 1098. For a short time in the mid-12th century Wolin was the seat of a bishopric and it was incorporated as a town in 1250. During the Thirty Years' War, it was taken over (1630) by Sweden, and in 1720 it became a part of Prussia. It came under Polish administration in 1945. Pop. (1962) 3,000.

WOLLASTON, wŏl'əs-tən, **William Hyde**, English scientist: b. East Dereham, Norfolk, England, Aug. 6, 1766; d. London, Dec. 22, 1828. Born of a moderately well-to-do family, he was educated at Charterhouse and Caius College, Cambridge, where he took the degree of doctor of medicine in 1793. Although possessed of the attributes of an excellent doctor—intelligence, extraordinarily keen senses, and superb manipulative ability—he was unhappy as a practicing physician and in 1800 turned to chemistry and physics.

Between 1803 and 1805 Wollaston focused his attention on the problem of procuring platinum in a malleable form so that it could be easily shaped. His efforts were successful and his fortune assured. The relative inertness of platinum made it an ideal material for use in the production of sulfuric acid, and Wollaston's process

permitted the large-scale use of this metal in industry. From 1802 until his death a whole host of discoveries flowed from his laboratory. His work on platinum led him to the discovery of two new metals—palladium (1803) and rhodium (1804). In 1802 he first used the method of total reflection for the measurement of refractivity. In the same year he invented a primitive form of spectroscope and first observed the dark lines in the solar spectrum now known as Fraunhofer lines. His interests in optics and in mineralogy led him to the invention of the reflecting goniometer in 1809. With this instrument it was possible, for the first time, to make accurate measurements of crystal angles and to place crystallography on a firm quantitative base.

In chemistry, Wollaston was particularly intrigued with the consequences of John Dalton's new atomic theory, and he tried in vain to convert his friend Sir Humphry Davy to it. He contributed papers of considerable worth to the theory of multiple proportions and constructed an accurate table of equivalents for the chemist's use. He also investigated the new phenomenon of the voltaic cell and showed, in 1801, that the electricity generated by this apparatus was identical with common or static electricity. He was elected a fellow of the Royal Society in 1794.

L. PEARCE WILLIAMS,
Professor of History, Cornell University.

WOLLASTON LAKE, lake, Saskatchewan, Canada, northwest of Reindeer Lake and southeast of Lake Athabasca, with an area of 796 square miles. It drains into the Churchill and Mackenzie river systems. The lake was named in 1821 after William Hyde Wollaston (q.v.).

WOLLASTON PENINSULA, a promontory of Victoria Island, Northwest Territories, Canada, in Franklin District. The peninsula, 60 to 70 miles wide and about 140 miles long, is in the southwest part of the island, bounded on the north by Prince Albert Sound, on the west by Amundsen Gulf, and on the south by Dolphin and Union Strait. It was originally named Wollaston Land, after William Hyde Wollaston (q.v.), by Sir John Franklin in 1821. Read Island is off the south coast.

WOLLASTONITE, wŏl'əs-tən-ĭt, a mineral CaSiO_3 , formerly classified as a member of the pyroxene group, but its atomic arrangement has been found to consist of SiO_3 chains differently oriented from those of pyroxenes. Wollastonite is triclinic and usually occurs in cleavable or fibrous masses, with (100) and (001) cleavages. The hardness is 4.5 to 5.5, and the specific gravity 2.9. It is usually white and translucent, and has a vitreous to silky luster. It is a contact metamorphic mineral and occurs with diopside, tremolite, and lime garnet in highly metamorphosed siliceous limestones. It has been found in California, Norway, Rumania, Mexico, and Hungary, and is mined at Willsboro, N.Y. It is used as a paint filler and in ceramic products such as electrical insulators, tiles, and porcelain. Parawollastonite is a monoclinic form, with very similar properties, formed at higher temperatures. Wollastonite was named after the English scientist William Hyde Wollaston (q.v.).

LEWIS S. RAMSDELL.

WOLLEGA, wŏl'ə-gə (sometimes **WALLEGA** or **WALLAFA**), province, Ethiopia, in the west cen-

tral part of the country, bordered by the Sudan on the west and by the provinces of Gojjam on the north, Shoa on the east, and Kaffa and Ilubabor on the south, with an area of about 25,900 square miles. A mountainous region averaging 4,500 to 9,000 feet, it contains the peaks of Tula Wallel (10,830 feet) and Nasi (9,708 feet). Principal rivers are the Birbir, Dabus, and Dadessa, and the northern boundary is formed by the Blue Nile. Wollega produces coffee, beeswax, and hides for export and is one of the most important mining districts of Ethiopia, with gold and platinum in considerable quantities. Cobalt and mica have been discovered in the Nejo area but are not exploited. Lekemti (Nakamti) is the capital of the province; other major towns are Asosa and Dembidollo (Saio).

WOLLIN. See **WOLIN**.

WOLLO, wōl'ō (sometimes **WALLO**), province, Ethiopia, in the northeast part of the country, bordered on the northeast by the region of Eritrea, on the east by Djibouti, and by the Ethiopian provinces of Harar and Shoa on the south, Gojjam and Begemdir on the west, and Tigre on the north, with an area of about 30,400 square miles (78,700 sq. km.).

The eastern part of the province is occupied by plains and the Danakil desert, while the west is higher, rising to about 13,745 feet (4,189 meters) in the peak of Abuna Josef. Salt extraction, stock raising, and the cultivation of grain and cotton are the principal occupations. Dessye is the capital and major town of the province. Lalibala, near Abuna Josef, is a noted center of religious pilgrimage for Coptic Christians.

WOLLONGONG, wōl'an-gōng, city, Australia, in New South Wales, on the Pacific Ocean, about 50 miles south of Sydney. Greater Wollongong, with an area of 276 square miles, was formed in 1947 by the amalgamation of the former municipalities of Wollongong (1859), Central Wollongong (1859, including Port Kembla), and North Illawarra (1868), and the shire of Bulli (1906). Its widely spread urban centers, on a narrow strip between the ocean and the Illawarra Range, are tending to merge as the city grows. Steel milling and fabricating, centered at Port Kembla, are the major industries, with coal mining in the Illawarra Range, coke making and brickmaking. Textiles and clothing are also manufactured. Port Kembla has an artificial harbor. Rural industries have declined in the area but still are sufficient for most local needs; dairying is especially important in the south, around Lake Illawarra.

Settlement of the area began in 1815, and the town of Wollongong was established in 1834. There are spectacular views from Sublime Point and Mounts Keira and Kembla in the Illawarra Range. The city has a technical college. Pop.

5) Greater Wollongong, 211,068.

R. M. YOUNGER.

WOLLSTONECRAFT, Mary. See **GODWIN, MARY WOLLSTONECRAFT**.

WOLSELEY, wōl'z'le, **Garnet Joseph**, 1st **VISCOUNT WOLSELEY**, British field marshal: b. County Dublin, Ireland, June 4, 1833; d. Menton, France, March 25, 1913. Commissioned as a 2d lieutenant in 1852, he distinguished himself first in the Second Burmese War (1852-1853) and

then in the Crimea, where he lost an eye in 1855. He also fought with distinction in the Indian Mutiny (1857-1858) and in the capture of Peking, China (1860). The next decade was spent as a staff officer in Canada; early in the American Civil War he managed to visit Gen. Robert E. Lee, whose military genius fascinated him. In 1870 Wolseley commanded the Red River expedition against Louis Riel's rebellion and acquitted himself brilliantly. Meanwhile he had published *The Soldier's Pocket Book for Field Service* (1869), which achieved great popularity as a military manual.

Brought home to the War Office in 1871, Wolseley became the chief uniformed supporter of Edward Cardwell's attempts to reform the British Army by the introduction of the short service, the creation of a reserve, and the abolition of the purchase of commissions. His efforts at army reform were interrupted by participation in the Ashanti War (1873-1874) in Africa, where his capture of Kumasi brought him fresh fame, and the Zulu War (1879). In 1882 he was made adjutant general of the army and led the campaign against Arabi Pasha, culminating in the smashing victory at Tell el Kebir, Egypt, for which he was raised to the peerage as Baron Wolseley of Cairo and Wolseley. In 1884-1885 he commanded the expedition that just failed to rescue Gen. Charles George Gordon at Khartoum, but his effort was rewarded with elevation to the viscountcy (1885). He spent the remainder of his career in efforts to complete the reform of the army. In 1894 he was promoted field marshal, and was commander in chief from 1895 to 1900. Although he never met a European foe on the field of battle all that he did he did admirably. The popular expression, "It's all Sir Garnet," when things went well, shows how much he was appreciated. He published books on Marlborough (1894) and Napoleon (1895) and the autobiographical *The Story of a Soldier's Life* (2 vols., 1903). He was immortalized as W. S. Gilbert's "very model of a modern major-general" in *Pirates of Penzance*.

CYRIL B. FALLS.

Emeritus Professor of the History of War, Oxford University.

WOLSEY, wōl'zē, **Thomas**, English statesman and cardinal: b. Ipswich, Suffolk, England, 1474 or 1475; d. Leicester, Nov. 29, 1530. The son of a butcher, he overcompensated for his origins by his inordinate accumulation of wealth, overweening pride, and magnificence, in the course of a spectacular career. A clever boy sent early to Oxford, he graduated B.A. at 15 and became a fellow and bursar of Magdalen College, where, according to tradition, the completion of the famous tower was due to his energy. In 1498 he was ordained a priest. His ability and industry soon marked him out, and through the patronage of Sir Richard Nanfan, lord deputy of Calais, who made him his executor, Wolsey rose to the notice of Henry VII. The king used him on minor diplomatic missions to Scotland and to the Netherlands in 1508 and shortly before his death in 1509, made him dean of Lincoln. Thus began Wolsey's impressive career in diplomacy and administration and his fabulous accumulation of preferments in the church.

Henry VIII's first French war (1511-1513) went badly until Wolsey grasped the situation with his usual energy and prepared the way for the

victory at Théroutanne and the capture of Tournai (1513), of which he was given the bishopric. His success was further rewarded and his power sealed by his being made bishop of Lincoln and then archbishop of York in 1514. In 1515 he was made a cardinal and in 1518 legate *a latere* for life, an unprecedented position which gave him virtual control over the English church, above the archbishop of Canterbury. In 1515 also, the king made him lord chancellor, so that secular as well as ecclesiastical jurisdiction was concentrated, under the royal power, in Wolsey's hands. Though the event was unexpected by either, this paved the way for the Reformation on Wolsey's fall, and the concentration of both jurisdictions in the monarchy. Wolsey's career, therefore, marked the end of the medieval order and a decisive transition to the new.

Wolsey intended to use his vast powers for reform, and he suppressed a number of small and failing monasteries to found his school at Ipswich; the grandest of the colleges at Oxford, Cardinal College, which became Christ Church; and various lectureships. He was a genuine patron of learning, and his administration was tolerant and nonpersecuting. But his main energies were deflected into a sterile diplomacy, the pursuit of a more decisive position for England in the conflict of European powers than her strength and resources warranted. Western Europe was dominated by the conflict between France and the Holy Roman Empire, between Valois and Habsburg. England's traditional alliance, because of her trading connection with the Netherlands, was with the Empire. Wolsey's conception of the balance of power was to use England as a weight, now on one side, now on the other, against whichever power was too strong, and thus to raise his country's prestige and himself, if possible, to the papacy. This spectacular policy appealed to Henry VIII, and on it he and Wolsey used up the real resources built up by the prudent Henry VII in cash and favorable trade treaties.

The death of Emperor Maximilian I in 1519 led Wolsey and Henry to think of themselves as the arbiters of Europe. At the famous Field of the Cloth of Gold near Calais, in 1520, they met with Francis I of France in extravagant splendor that led to nothing, for shortly thereafter an alliance was concluded with the new emperor, Charles V. When war broke out between France and the Empire in 1521, Wolsey had no desire to take part in it; but he was overborne by anti-French feeling in England and by Henry and Queen Catherine, Charles V's aunt. It soon became evident that the emperor, hard pressed financially, intended to use English resources for his own designs against France, while he had no intention of seeing Wolsey made pope and gave him no support at the elections for the papacy in 1522 and 1523. Meanwhile Wolsey had to bear the burden of unpopularity with Parliament and country for the heavy taxation necessary to raise the immense sums to support the alliance and the war. Public opinion mounted against him; it has left its mark in literature in the satires and invectives of John Skelton and others. His personal extravagance made him an easy target: he was building York Palace, which became Whitehall Palace at Westminster, and Hampton Court up the Thames.

In 1525 Francis I was defeated by the emperor at Pavia and taken prisoner. This took the world by surprise and overthrew the whole structure of Wolsey's European policy—the maintenance of a

Thomas Cardinal Wolsey, lord chancellor of England, was one of Europe's leaders in the early 16th century.

balance of power, if possible peace, and the independence of the papacy. Instead, there followed the ascendancy of Charles V, the imprisonment of Pope Clement VII, and the sack of Rome (1527). Those powers that felt themselves threatened came together in the League of Cognac, and England passed over to the side of France against the emperor. This was very unpopular in England, but it coincided with Henry VIII's personal desire to rid himself of Queen Catherine, marry Anne Boleyn, and ensure the succession to the throne with a male heir.

Henceforth, Wolsey was caught in a hopeless impasse. With the pope under the emperor's control, he could not procure the annulment of Henry's marriage to Catherine; in 1529 the case, which had been submitted to Lorenzo Cardinal Campeggio and Wolsey as joint papal legates, was revoked to Rome, and Wolsey's failure was made visible. With his fall imminent, Anne Boleyn passed over to the opposition, and his opponents in council and among the nobility joined to drive him from power. In October 1529 an indictment was drawn up against him as incurring the penalties of *praemunire* for accepting the commission as legate. Wolsey pleaded guilty, and all his temporal possessions were surrendered to the crown. There remained to him his archbishopric of York, which he had never set foot in, and there he repaired to take up his pastoral duties in the spring of 1530. Pursued by the malice of his enemies, in particular Thomas Howard, 3d duke of Norfolk, leader of the nobility, he was summoned back to London to answer charges of high treason. He died on the way, at Leicester Abbey. He was the last of the medieval princes of the church to rule the English state, and his fall left the way wide open for the breach with Rome and all its consequences in the Reformation, the dissolution of the monasteries, and the independence of the English church on a national basis.

WOLSTENHOLME TOWNE, wŏl'stən-hŏm, an archaeological site in southeastern Virginia, on the James River, about 10 miles (16 km) east of Jamestown. It contains the remains of a plantation founded in 1619 by colonists sent by the London Company. The excavation, which began in 1976, revealed the earliest town plan in colonial British America.

Relics at the site include human skeletons, gold and silver objects, clothing fragments, arms, and armor. Excavation has identified the outlines of a fort, dwellings, stables, and storage and warehouse buildings. The settlement, which may have housed as many as 200 inhabitants, was destroyed during an Indian uprising in March 1622. It was named after Sir John Wolstenholme, a London Company shareholder.

WOLVERHAMPTON, wŏl'vər-hamp-tən, a city in west central England, in the metropolitan county of the West Midlands, 13 miles (21 km) northwest of Birmingham. It occupies a low ridge in the northwest of the great Midlands industrial region and has excellent road, rail, and canal facilities. Until the Industrial Revolution, its main trade was in agricultural products and wool, but with the iron and steel industry it grew to be the "capital of the Black Country," noted for keys, locks, and buckles, which are still among its specialties. Later it tended to concentrate on heavy industry, and it manufactures a wide variety of products ranging from synthetic fibers to motorcycles and from electrical equipment to automobile tires.

The town derives its name from Wulfruna, sister of King Edgar, who in 996 founded a college here. The Church of St. Peter is mainly 13th to 15th century work and has a remarkable tower and finely carved stone pulpit and font. Medieval Flemish glass is in the chancel windows. The carved shaft of a stone cross in the churchyard is probably from the 12th century. Wolverhampton also has a good art gallery and museum. Population: (1981) 252,447.

H. GORDON STOKES

Author of "English Place-Names"

WOLVERINE, wŏl-və-rēn', a powerful carnivore of the weasel family (Mustelidae), reputed to sometimes drive bears and cougars from their

prey. The wolverine has a heavy build with an arched back, a bearlike head, massive limbs, large feet, long hair, and a bushy tail. It is mostly dark brown with a yellowish brown strip from shoulder to rump on each side. The forehead is white, and the undersurface, face, and tail tip are black. Its head-body length ranges from 25 to 40 inches (650–1050 mm) with a 7- to 10-inch (170–260 mm) tail. It weighs 15 to 70 pounds (7–32 kg).

The wolverine eats animals ranging in size from lemmings to caribou, although larger animals usually are eaten in the form of carrion. It strips trap lines of bait or captured animals and breaks into vacant cabins. It often spoils more than it eats with its strong skunklike spray. It is active the year round, mostly at night, and solitary except when mating. One to five young are born between January and April and leave their mother in the fall.

Once found over much of northern Europe and North America, the wolverine is now largely restricted in Eurasia to the northern Soviet Union and parts of Scandinavia. In North America it is found mainly in the tundra and coniferous forests of Alaska, British Columbia, and above the 55th parallel in the rest of Canada. Nearly extinct in the 48 states by the 20th century, wolverines have made a comeback and are now reported from northern California to western Montana.

WOMAN IN WHITE, *The*, a novel by William Wilkie Collins, published in 1860 after being serialized in Charles Dickens' magazine *All the Year Round*. The novel was brilliantly successful and is usually bracketed with *The Moonstone* (1868) as a supreme example of the author's skill in constructing plots. The story is told in a succession of separate narratives by different characters, each seeing and recording only a portion of the action. The plot concerns a conspiracy against the life, property, and sanity of Laura Fairlie by her husband, Sir Percival Glyde, abetted by Count Fosco. She is saved through the resourcefulness of her half-sister, Marian Halcombe. The villains are throwbacks to those of the Gothic romances, but redeemed from mere melodrama by sinister intelligence. Collins himself, in his preface, explained in a single sentence its popularity: "Here is a novel which has met with very kind reception because it is a Story."

DELANCEY FERGUSON, *Brooklyn College*

An American wolverine.

WILLIAM W. BACON III, FROM RAPHO GUILLUMETTE

WOMAN KILLED WITH KINDNESS, A, a play by Thomas Heywood, written and probably acted in 1603, published in 1607. It is Heywood's masterpiece and one of the best early examples of English domestic tragedy. The main plot concerns the infidelity of the wife of a Yorkshire country gentleman. The husband, in a sort of Christian reversal of conventional revenge plays which demanded blood and violence, decides to kill her "with kindness" by sparing her life but banishing her from his home and children. He provides for her existence in an isolated house, where she dies of self-imposed starvation.

The play has been revived successfully in the 20th century. Some of the scenes are dramatically and psychologically effective for a modern audience or reader; they concern real problems of rather ordinary people. But the play is marred by an overwrought, melodramatic subplot.

WILLIAM BRACY, *Reader College*

PHOTO WORLD

The efforts of the suffragettes led to passage of the 19th Amendment, giving American women the right to vote.

WOMAN SUFFRAGE, suf'rij. Women in most of the countries of the world today can vote and be elected to public office on the same basis as men. In some countries where the franchise has not been fully gained, women can vote in local elections or in national elections with certain limitations. In a few countries they cannot vote at all. The almost worldwide recognition of the political rights of women came, however, only after centuries of work by individuals and later by organizations and intergovernmental bodies. The right to vote became the basic demand of feminist movements because the election was considered to be the fundamental act of political life. The vote was essential because in the political arena the basic decisions are made that shape the patterns of society in which women live. Once gained, it could be used to eliminate other discriminations. Historically, suffrage came first, eligibility to hold office next, and actual access to public office still later.

The philosophy underlying the demand for woman suffrage was the doctrine of natural rights. The woman suffrage movement itself was generally allied with other social reform movements, such as the abolition of slavery, temperance, and the extension of education. Although the movement was led primarily by women, it enlisted from the beginning the support of many men. Opposition took on different shapes in different countries. Political parties were uncertain of the effect of women's votes. There was religious opposition to their participation in anything that did not pertain directly to the home and the rearing of children. Economic interests wanted to keep women as a voiceless labor force. Specific industries, particularly the brewing and distilling industries, feared the woman's vote as an ally of the temperance movement.

In general, established laws, customs, attitudes, and habits of thinking were slow to change, especially when they involved the acceptance of new ideas about women and their place in society.

UNITED STATES

As early as 1647, Margaret Brent demanded a "place and voyce" in the Maryland Assembly. Although she was the executrix of Gov. Leonard Calvert's will, her request was denied. From 1691 to 1780, women who were property owners voted in Massachusetts. After the Revolution, New Jersey temporarily granted suffrage to women when, in 1790, a revision of the electoral law used the words "he or she"; women voted under this provision until 1807, when the legislature limited the vote to white male citizens.

Seneca Falls Convention. By the 1830's and 1840's increasing efforts were being made to awaken women to ask for full enfranchisement. Paulina Wright Davis, Lucretia Mott, Lucy Stone, Ernestine Rose, Abigail Kelley Foster, and Angelina and Sarah Grimké spoke out for women's rights. Books such as Margaret Fuller's *Woman in the Nineteenth Century* (1845) had an influence. Then, in June 1848, Elizabeth Cady Stanton, Lucretia Mott, Martha C. Wright, and Mary Ann McClintock issued a call for a convention to discuss the rights of women. Meeting in the Wesleyan chapel at Seneca Falls, N.Y., on July 19 and 20, the convention adopted a Declaration of Principles patterned on the American Declaration of Independence. Signed by 68 women and 32 men, the Seneca Falls declaration stated: "We hold these truths to be self-evident: that all men and women are created equal. . . . The history of mankind is a history of repeated injuries and usurpations on the part of man toward woman, having in direct object the establishment of an absolute tyranny over her. . . ." The convention demanded for women the right of equal education and the right to preach, to teach, and to earn a livelihood. It also passed a resolution stating "that it is the sacred duty of the women of this country to secure to themselves their sacred right to the elective franchise." Thus was laid the foundation for the woman suffrage movement in the United States.

Growth of the Movement. The Seneca Falls convention was followed by conventions in other states. In 1850 the first national convention was held in Worcester, Mass., with delegates from nine states present. Another convention held in Syracuse, N.Y., in 1852 was significant because it marked the first joint venture of Susan B. Anthony and Elizabeth Cady Stanton, who for the next 50 years were in the forefront of the fight for equality for women in the United States. The convention idea continued to spread until women in many states were gathering to launch educational and legislative programs to change the state constitutions and gain legal recognition of woman's right to vote.

Following the Civil War, the woman suffrage movement split over tactics. On May 15, 1869, those who felt that the success of the movement required the enactment of an amendment to the United States Constitution formed the National Woman Suffrage Association, with Susan B. Anthony and Elizabeth Cady Stanton as its leaders. In November 1869 the American Woman Suffrage Association was established to obtain woman suffrage through amendment of state constitutions; its principal leaders were Lucy Stone and Julia Ward Howe. In 1890 the two organizations amalgamated in the National American Woman Suffrage Association, and both methods of work were followed. Mrs. Stanton became its president (1890-1892), followed by Susan B. Anthony (1892-1900), Carrie Chapman Catt (1900-1904), Anna Howard Shaw (1904-1915), and Carrie Chapman Catt (1915-1920).

Adoption by States. Although widows were granted suffrage in school matters in Kentucky in 1838, the first victory for general woman suffrage came in 1869 in the Territory of Wyoming. When Wyoming came into the Union in 1890, it became the first state to provide for woman suffrage in its constitution. It was followed by Colorado (1893) and Utah and Idaho (1896). Fourteen years passed until another state, Washington, granted women the right of equal suffrage (1910). This was followed by California (1911); Arizona, Kansas, and Oregon (1912); Alaska Territory (1913); Montana and Nevada (1914); New York (1917); and Michigan, Oklahoma, and South Dakota (1918). Suffrage in presidential

elections was won in Illinois (1913); Nebraska, North Dakota, and Rhode Island (1917); and Indiana, Iowa, Maine, Minnesota, Missouri, Ohio, Tennessee, and Wisconsin (1919). Woman suffrage in primary elections was won in Arkansas in 1917 and in Texas in 1918.

The 19th Amendment. Though the National American Woman Suffrage Association was proud of its record in gaining amendments to state constitutions, it was clear that full woman suffrage could be realized only through an amendment to the United States Constitution. Known as the "Anthony Amendment," it was introduced by Sen. Aaron A. Sargent of California in 1878 and read: "The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any state on account of sex." The amendment was defeated in the Senate on Jan. 25, 1887, by a vote of 16 to 34, and although it was reintroduced in each succeeding Congress, it lay dormant until 1914. Then, spurred by a petition of almost 500,000 names presented to Congress by the National American Woman Suffrage Association, and by the agitation of the National Woman's Party led by Alice Paul and Lucy Burns, Congress reconsidered the "Anthony Amendment." On March 19, 1914, the amendment was defeated in the Senate, 34 in favor and 35 against; the House defeated it on Jan. 12, 1915, 174 to 204. Both votes fell considerably short of the necessary two-thirds majority.

The active role of women in World War I helped greatly to change the picture. On Jan. 10, 1918, the amendment was passed by the House, 274 to 136, and the Senate followed suit on June 4, 1919, 66 to 30. Extensive campaigns were waged in the states for ratification. On Aug. 18, 1920, Tennessee became the 36th state to ratify the amendment, and 8 days later it was proclaimed part of the United States Constitution as the 19th Amendment.

BRITAIN

The suffrage movement in Britain paralleled the movement in the United States. Here, too, there were early efforts to gain the franchise for women. In the 15th century, women petitioned for the right to vote. Books like Mary Wollstone-

The protest parades of England's suffragettes—and their able service during World War II—helped win British women the franchise.

craft Godwin's *A Vindication of the Rights of Women* (1792) argued for woman suffrage. The demand was also raised by the Chartist movement in the 1840's. Soon afterward reports of suffrage agitation in the United States reached England. An article by Mrs. John Stuart Mill in the *Westminster Review* in 1851 created widespread interest.

The first woman's suffrage committee was formed in 1865 in Manchester. Two years later, John Stuart Mill presented to Parliament a petition signed by nearly 1,500 people, including Florence Nightingale, Frances Power Cobbe, Josephine Butler, Harriet Martineau, and Mary Somerville, calling for equal suffrage for women. An amendment to this effect to the Reform Bill of 1867 was lost, 73 in favor, 196 against.

Following the defeat of the amendment, numerous local woman suffrage societies were organized in England and Scotland, followed by the formation of the National Union of Women's Suffrage Societies under the leadership of Millicent G. Fawcett. From 1867 on, the movement in Britain and Ireland never ceased. In 1869, Parliament granted the municipal franchise to women taxpayers. The first separate bill for woman suffrage was introduced in 1870.

During the 1880's, although a majority of the House of Commons was in favor of women's suffrage, the government, whether Liberal or Conservative, prevented a final vote from being taken. While women were made eligible to become mayors and to sit in city and county councils, progress was slow in the major areas. After many delays and defeats, an increasing number of women were ready to follow Emmeline Pankhurst and her daughter Christabel in efforts in the early 1900's to organize women for more dramatic action. The Women's Social and Political Union, of which they were leaders, adopted militant methods, which became more violent as government opposition grew. When World War I broke out, the suffrage societies placed their well-trained forces at the service of the government and carried on what was probably the best organized work anywhere of women during the war. The need for reform in the franchise laws was recognized at last by members of Parliament from all parties. The Representation of the People Act was passed by the House of Commons in June 1917 and by the House of Lords on Feb. 6, 1918. It conferred the complete franchise, at the age of 30, on all women in Britain and Ireland. In 1928 the age was reduced to 21, and women voted on the same basis as men.

DEVELOPMENTS IN OTHER COUNTRIES BEFORE WORLD WAR II

Although the woman suffrage movement originated in the United States and Britain, its first successes were achieved in two of the British Dominions and in Scandinavia. The first country to grant women equal suffrage with men was New Zealand (1893), followed by Australia (in federal elections) in 1902. Women in South Australia could vote in state elections in 1894, and in Western Australia in 1899. The franchise in state elections was granted in New South Wales in 1902, Tasmania in 1903, Queensland in 1905, and Victoria in 1908.

Scandinavia. As in many other countries, women in Scandinavia gained the franchise by stages. Sweden first granted women the right to vote in 1863, though it was restricted to municipal

elections and limited to unmarried women who paid a certain amount of taxes. Equal voting rights in municipal elections were granted to all women in 1918. The following year women gained the right to vote in all elections.

Finland gave widows and unmarried women local voting rights as early as 1865 and granted universal suffrage to women in 1906.

In Norway, women taxpayers were granted the right to vote in municipal elections in 1901. In 1907, women who voted locally could vote in national elections. Women were granted equal municipal voting rights with men in 1910, a right extended to national elections in 1913.

In Denmark women were granted the municipal franchise in 1907. When the new constitution was adopted in 1915, universal and equal suffrage was granted. In Iceland, women taxpayers voted in municipal elections in 1909 and took part in national elections from 1915.

Other European Countries. By the time of World War I, the movement to enfranchise women was finding new acceptance, largely through the work of the International Council of Women (1888) and the International Woman Suffrage Alliance (1904). The loyalty of women and the sacrifices made during the war years speeded the movement. Women were enfranchised in the Netherlands in 1917. Belgium granted municipal and communal suffrage to women in 1921; widows or widowed mothers of soldiers or civilians killed in action or imprisoned during the war were given the vote in national elections. Spain granted the vote to women in 1931.

World War I also hastened the enfranchisement of women in central and eastern Europe. Following the Russian Revolution of 1917, women were granted equal voting rights with men in the Soviet republics. In Luxembourg (1918) and Germany (1919) women were included in the electorate. In Austria, Czechoslovakia, and Poland women gained the vote in 1919, and in Hungary in 1920 (although with higher age requirements than men). In 1929, Romania and Greece granted women suffrage in municipal elections, subject in the latter country to higher age and literacy requirements.

Canada. In Canada the movement for woman suffrage was led by the National Suffrage Association, joined in later years by the National Council of Women. The great contribution made by women during World War I led in 1917 to the granting of the right to vote in provincial elections to women in active military service. The federal franchise was granted to women in 1918. The right to vote in provincial elections was first granted in Alberta, Manitoba, and Saskatchewan in 1916 and in Nova Scotia in 1918. In New Brunswick and Ontario, women gained the vote in 1919, in British Columbia in 1920, in Prince Edward Island in 1922, in Newfoundland in 1925 (although subject to a higher age requirement than men), and in Quebec in 1940.

Latin America. After World War I, the suffrage movement developed also in Latin America. When the franchise was won in the United States, women were not able to vote in any of the Latin American countries. The Inter-American Commission of Women, a specialized agency of what is now the Organization of American States, was organized in Havana, Cuba, in 1928 to work for the extension of civil, political, economic, and social rights of women of the Americas. Spectacular progress was made largely through the ef-

forts of the commission, led by Esther Neira de Calvo (Panama), its executive secretary. Other leaders in the woman suffrage movement in the Americas were Bertha Lutz (Brazil), Minerva Bernardino Coppá (Dominican Republic), and Isabel P. de Vidal Urdenata (Uruguay).

In Latin America, suffrage began with women taking part in local elections. Some women voted in municipal elections in the province of Santa Fé, Argentina, as early as 1921, provided they had a diploma authorizing practice in a profession, or if they administered their own estates. The right to vote in provincial elections was granted to women in the province of San Juan, Argentina, in 1927. In Mexico, women voted in state elections in San Luis Potosí and Yucatán in 1923, in Chiapas in 1926, in Guanajuato in 1936, and in Puebla in 1939.

In 1929, Ecuador became the first Latin American country to grant universal suffrage in national elections, with the restriction that it was obligatory for men and optional for women. When the women of Uruguay gained the vote in 1932 without any restrictions, they became the first Latin American women to be able to vote on the same basis as men. Brazil also adopted universal suffrage in 1932, followed by Cuba in 1934. Suffrage in municipal elections had been granted to Chilean women in 1931, subject to restrictions. Women in Peru won the vote in municipal elections in 1933.

South Africa. In South Africa the woman suffrage movement was limited to gaining the vote for white women. Municipal suffrage was granted to women in the Orange Free State in 1914. In Cape Colony, Natal, and Transvaal, women gained suffrage in 1919. The right to vote on an equal basis with men was gained in 1930.

Asia and the Middle East. During the period prior to World War II, the suffrage movement started to develop in Asia and the Middle East, though the religious tenets dominant in the area put serious obstacles in its path. In nations where a wife was but one of many, where girls were married at an early age, and where women were often considered little more than slaves, suffrage was difficult to achieve.

In 1930 women in Turkey won the vote in municipal elections, and in 1934 all restrictions were removed. In Burma some women voted as early as 1922; equal voting rights were granted in 1935. In 1932, Thailand became the first Asian country to establish universal suffrage. In 1937 the women of the Philippines gained the vote.

Changes occurred in India largely due to the leadership of Vijaya Lakshmi Pandit and the All-India Women's Conference. By 1929 women in seven of the nine provinces had obtained the right to vote in provincial elections; in 1935 the vote was extended to a limited number of women in national elections. Ceylon (Sri Lanka) granted women the right to vote in 1931, subject to higher age requirements than men. Equal voting rights were gained in 1934.

DEVELOPMENTS AFTER WORLD WAR II

After World War II, most of the remaining countries of the world granted the vote to women. There was a great change in public sentiment. The heroism and valor of women during the war years was rewarded by taking women into political partnership.

United Nations. The United Nations (UN) accelerated the worldwide movement to advance

the political rights of women. The UN Charter, signed in June 1945, was the first accepted international document that clearly defined equal rights for women. The preamble to the Charter contains the statement that the peoples of the United Nations are determined "to reaffirm faith . . . in the equal rights of men and women. . . ." There are eight references in the Charter to "without distinction as to sex." On Dec. 11, 1946, a resolution proposed by Denmark and unanimously adopted by the General Assembly asked all members of the United Nations, which had not already done so, to adopt measures to grant women the same political rights as men.

To implement the provisions of the UN Charter, the Commission on the Status of Women was established with the function of preparing recommendations and reports on promoting women's rights in political, economic, social, and educational fields. The commission proclaimed "as its first aim equal participation of women in government and the possibility for women to exercise all the rights and assume all the duties of citizens." The commission decided to give priority to the extension of political rights, since little could be achieved without them. Thus the commission became the new focal point for the worldwide suffrage movement.

In 1948 the Universal Declaration of Human Rights was adopted by the United Nations. It states that "everyone without distinction of any kind" is entitled to the rights and freedoms set down as "a common standard of achievement for all peoples and all nations." Article 21 states that elections "shall be by universal and equal suffrage. . . ."

Another UN action was the adoption of the Convention on the Political Rights of Women by the General Assembly on Dec. 20, 1952. The convention provides that women shall be entitled to vote in all elections and be eligible for election to all publicly elected bodies.

The United Nations declared 1975 to be International Women's Year and established 1975-1985 as the UN Decade for Women. It sponsored international conventions in 1975 and 1980 to assess women's progress in matters of education, employment, family planning, and health.

Europe and Latin America. Most of the remaining countries of Europe hastened to grant women the right to vote following the end of World War II. While the war was still on, Gen. Charles de Gaulle promised that the women of France would be granted the right to vote. This right was subsequently decreed by the provisional government in 1944 and confirmed by the constitution that was adopted in 1946, with both men and women voting. In the same year the women of Italy, Albania, Romania, and Yugoslavia were granted the full franchise. In 1948, Belgium followed suit. Women gained equal suffrage rights in Hungary in 1945 and in Bulgaria in 1947.

Partial victories were recorded in Portugal in 1945, where women received the franchise with restrictions; in Switzerland in 1959 and 1960, where women in the cantons of Neuchâtel, Vaud, and Geneva were granted suffrage in cantonal elections, and in Monaco in 1945, where women were granted the franchise in municipal elections. It was not until 1971 that Swiss women were enfranchised for federal elections; that year 11 women were elected to the parliament. Woman suffrage reached Andorra in 1970 and Liechtenstein in 1984.

The movement for woman suffrage spread across Latin America in the 1940's and 1950's. With few restrictions, women got the vote in the Dominican Republic in 1942, Guatemala in 1945, El Salvador and Panama in 1946, Argentina in 1947, Chile and Costa Rica in 1949, Mexico in 1953, Colombia in 1954, Honduras, Nicaragua, and Peru in 1955, and Haiti in 1957.

Africa. The achievement of independence in Africa brought with it equal political rights for women. In the countries formed from French West Africa and French Equatorial Africa, the right to vote was granted in 1946, without distinction as to sex, to persons who met specified statutory requirements. Universal suffrage was adopted in 1956 and confirmed by the first constitutions that were adopted after independence. In Tunisia and Morocco equal suffrage was adopted in 1959.

Similarly, in the former British colonies, suffrage was granted prior to the achievement of independence. In Ghana, for example, equal suffrage was granted in 1950 and confirmed by the 1957 constitution.

Asia and the Middle East. In Asia, political equality was viewed as fundamental to the development of independent nations. Even prior to independence, the nationalist movements recognized the need to enlist the support of women in their cause, and equal suffrage was a universal demand. Equal suffrage was written into the new constitutions of Ceylon (Sri Lanka) and Burma (1947), Indonesia and India (1949), and was adopted in Israel from the date of its independence (1948). In Pakistan the vote was granted to women in 1952 in provincial elections and in 1956 in national elections, largely due to the work of Mme. Liaquat Ali Khan, leader of the All-Pakistan Women's Congress. The vote for women was confirmed in Laos, Cambodia, and Vietnam in 1956 and in Malaya in 1957.

In the Far East, the women of Japan were enfranchised in 1946, in China in 1947, and in Korea in 1948. In the Middle East, however, women suffrage was slow to penetrate. In Iran limited voting privileges in municipal elections were adopted in 1949 and on the national level in 1963. Women first voted in Lebanon in 1952, if they had a primary education, and gained full suffrage in 1957. In Syria and Egypt women were granted suffrage in 1949 and 1956, respectively, but subject to certain restrictions not imposed on men. Other Middle Eastern countries followed suit in the 1960's, but women remained disfranchised in Kuwait. See also WOMEN'S RIGHTS MOVEMENT; WOMEN'S STATUS.

WOMAN'S CHRISTIAN TEMPERANCE UNION (WCTU), an organization of Christian women for the protection of the home, the abolition of the liquor traffic, and the triumph of the golden rule in custom and law. The National WCTU, whose headquarters are in Evanston, Ill., was organized in Cleveland, Ohio, in November 1874 as a result of the Woman's Temperance Crusade of 1873-1874. It now has approximately 250,000 members, organized in 6,000 groups in every state of the Union. The World WCTU has organizations in 72 countries of the world. Affiliated with the National WCTU are the Youth Temperance Council (ages 13-29) and the Loyal Temperance Legion (ages 6-12).

The organization publishes the *Union Signal* (monthly) and the *Young Crusader* (monthly), as well as many books, pamphlets, and leaflets. In addition to its work for the promotion of temperance and abolition of the traffic in liquor, it engages in extensive civic and philanthropic services. In Evanston, Ill., it maintains the Frances E. Willard Memorial Library for Alcohol Research, the second-largest library of its kind in the world. It also sponsors intercollegiate oratorical contests to stimulate research among college students on alcohol and related problems. The motto of the union is "For God and Home and Every Land." Former National President, WCTU

WOMBAT, wom'bat, a sturdy nocturnal Australian marsupial (family Vombatidae) that resembles a badger. It has a long but compact body, a very short tail, and short powerful legs with strong claws for digging. Its dense fur is gray or brown to black. Wombats spend the day in burrows that they dig themselves. Their chief food is grass, but they may also eat roots and bark of trees and shrubs. The wombat's voice is hoarse and growling. A single young is born about July and becomes independent within a half year.

The coarse-haired or common wombat (*Phascolumis* or *Vombatus*) lives in the coastal hills of southeastern Australia and Tasmania and was formerly found on the islands of Bass Strait. The soft-haired or hairy-nosed wombat (*Lasiorhinus*) may now be found only in the drier south central

A common wombat (*Phascolumis ursinus*) forages for food in winter snow in the Alps of southeastern Australia.

coastal region of Australia. It has been killed off in many areas by campaigns to eliminate it as an agricultural pest. Campaigns to kill rabbits, the scourge of Australian agriculture, also took a severe toll of wombats, because rabbits often hide in wombat burrows.

A fossil genus of the Pleistocene epoch was as large as a hippopotamus.

WOMEN IN THE ARMED FORCES. Although civilian American women had served their country in the Revolutionary and subsequent wars, they were not officially allowed to join the U.S. armed forces until 1901, when Congress established the Army Nurse Corps. Women were first permitted to hold military rank in World War I. During World War II, women's reserve units were created for the Army, Navy, Marines, and Coast Guard. The Women Airforce Service Pilots (WASPs), a civilian unit, piloted noncombat aircraft. In 1948 the Women's Armed Forces Integration Act gave women permanent regular and reserve status in the Army, Navy, Air Force, and Marines. However, this law also limited the number of enlisted women and the rank they could attain. Not until 1973, prompted by the women's movement and the end of the draft, did the services actively begin to recruit women. In 1976 the military, naval, air force, and coast guard academies were opened to women. By the mid-1970's all the female auxiliary units had been dropped, and in general women were accepted into the military, trained, and paid on virtually the same basis as men.

Air Force. Women have been an integral part of the Air Force since legislation in 1948 established the women in the Air Force (WAF). Prior to that time, during World War II, 40,000 women known as Air Wacs served with the Army Air Corps and Army Air Forces. WAFs served with all major commands within the United States and in the majority of overseas areas. Women have since been integrated into the Air Force structure, and the term WAFs is no longer used. Women were first allowed to fly military aircraft in 1977, but by law they may not fly aircraft engaged in combat missions.

Army. In May 1942, Congress created the Women's Army Auxiliary Corps (WAAC) and authorized an eventual enrollment of 150,000. In 1943, Congress established the Women's Army Corps (WAC), replacing the auxiliary organization. Women now were detailed to almost every branch of the army. Legislation in 1948 made the WAC a permanent organization. The corps was dissolved in 1978, when women were incorporated into regular army units. Women are now employed in all noncombat occupational fields in the Army, Army Reserve, and National Guard.

Navy. Women were enlisted in the United States Naval Reserve for the first time during World War I. During World War II, legislation enacted in 1942 created the Women's Reserve of the United States Naval Reserve. WAVES (Women Accepted for Volunteer Emergency Service), as the Navy women were called, reached a peak strength of about 86,000 in August 1945.

WAVES became a permanent part of the Regular Navy and the Naval Reserve in 1948.

Navy women today are no longer referred to as WAVES.

Navy Nurse Corps, they are completely integrated into the Navy structure, but they are barred from serving on combat vessels.

WOMEN'S BUREAU, Federal, an agency of the U.S. government that promotes the welfare of women who work. An act of Congress created the bureau within the Department of Labor in 1920. The act was a response to concern about poor working conditions and low pay for women, many of whom labored for long hours in "sweatshops" within the garment industry. During World War II the bureau helped the country meet the need for industrial workers while men were in military service.

A sharp increase in the number of women who wanted to enter the work force in the 1970's posed a new challenge for the bureau, which focused its efforts on certain categories of workers. These included minority women and older women who were subject to discrimination, and newly divorced or widowed women who entered the job market because of financial need. The bureau also sought to help women entering fields traditionally dominated by men.

The bureau analyzes the effect of government programs on women, keeps track of relevant state and federal legislation, collects and publishes economic and legal data, and develops programs that serve as models for local communities.

WOMEN'S CAUCUS, kó'kəs, a nonpartisan organization of American women seeking equality with men in jobs at all government and political levels. The organization, whose full name is the National Women's Political Caucus, was founded at a meeting in Washington, D.C., on July 10-11, 1971. The caucus served notice that women would no longer be content with token offices and menial jobs, but it recognized that political power would not be given to them—they would have to take it.

In addition to an office in Washington, the caucus is organized at local and state levels to rally support for women candidates, to register new women voters, and to press all political parties to accept women in decision-making positions. It has established a set of guidelines for determining the candidates to support for public office, emphasizing the "elimination of sexism, racism, violence and poverty." The caucus' lobbying efforts have supported the passage of the Equal Rights Amendment and the protection of a woman's right to reproductive freedom.

Other priority issues include the enforcement of existing antidiscrimination legislation, improving the economic status of women, adequate housing and medical care for all Americans, the elimination of hunger and malnutrition, preservation of the environment, and the elimination of tax inequities involving women and children.

WOMEN'S CLUBS, General Federation of, an international women's organization founded in 1890. It was established to unite and promote the common interests of women's clubs throughout the world. It contains departments of the arts, conservation, education, home life, international affairs, international clubs, and public affairs. Membership numbers some 10 million women from nearly 50 countries.

The federation, whose headquarters are located in Washington, D.C., holds an annual convention and publishes *Clubwoman Magazine*.

The proposed Equal Rights Amendment to the U.S. Constitution became a hotly disputed women's rights issue.

WOMEN'S RIGHTS MOVEMENT. The late 20th century has been marked by a worldwide effort by women to gain rights previously denied them. The particular rights sought have varied from one society to another. However, economic rights, educational opportunities, and access to adequate health care are common concerns. Social freedoms and political participation are also widespread goals.

The women's rights movement is built on predominantly Western, 19th century efforts. Women bonded together to address grievances and needs before then, but records are scant and incomplete. Even less well known are the struggles of non-Western women.

During the 19th century, women focused first on gaining greater educational opportunities, then on legislation to ensure women's control of their earnings and property, employment rights, and the right to vote. The U.S. women's movement disintegrated after women won the right to vote in September 1919. See *WOMAN SUFFRAGE*.

Some issues, however, continued to command attention in the United States. In the 1920's, women were excluded from political-party participation. They turned to the League of Women Voters, a successor to the National American Women's Suffrage Association, to gain political skills and expertise. Birth control, promoted by Margaret Sanger, changed slowly from an illegal, socially unacceptable practice at the turn of the century to one that was common and neutral, if not good, by the 1960's. Women's participation in the work force remained stable in the 1920's but climbed thereafter. During World War II women were actively recruited to take over war jobs.

Despite postwar efforts to return them to the kitchen, women composed 27.9% of the work force in 1950 and 32.8% in 1960. The Women's Bureau of the U.S. Department of Labor, established in 1920, documented the needs of working women but received little attention until the 1960's.

Organized Feminism—Vehicles of Reform. The Women's Liberation Movement that developed in the 1960's in the United States stemmed from two sources. First, younger women involved in the civil-rights and student-dominated antiwar

movements found themselves treated as second-class participants. Often college educated and influenced by socialist ideals, these women analyzed their situation, found it oppressive, and became advocates of radical change. They usually formed local organizations, which then joined to form loose national networks, sometimes with international ties.

Second, business and professional women, frustrated by and angry with the barriers they encountered, established NOW, the National Organization for Women, in 1966. The failure of enforcement agencies to take seriously the provisions of the Civil Rights Act of 1964, which banned discrimination based on sex, was an important prod in bringing the organizers together.

WEAL, the Women's Equity Action League, focusing on legal and economic issues, was established by former NOW members in 1968. Working-class and ethnic women, while claiming they were not feminists, organized around issues such as urban renewal. The network they formed became the National Congress of Neighborhood Women. Union women, often ignored by leadership, formed the Coalition of Labor Union Women (CLUW) in 1974. Feminist caucuses became a part of professional organizations. New churchwomen's organizations demanded expanded roles for women. By the early 1970's, most of the well-established national women's organizations had adopted one and usually more of the issues on the feminist agenda. The Equal Rights Amendment (ERA), once considered a radical cause, had the nearly unanimous support of these groups.

Consciousness-raising groups were widespread. Women's centers became common. Women examined their lives, and issues bubbled forth. These were identified and attacked with mixed success. Sexual harassment, wife abuse, and rape became public issues and then, slowly, punishable crimes. Research from a feminist point of view slowly gained legitimacy and eventually led to a new and positive perspective on traditional women's values. Newsletters and newspapers appeared. *Ms.* magazine, first published in 1972, was a commercial success and was followed by similar national publications. One indication of the diversity of issues that

emerged was the 26-plank Plan of Action adopted by the 1977 National Women's Conference. The conference, which attracted 20,000 participants, was sponsored by the U.S. government as America's part in the United Nations Decade for Women (1975-1985).

Ideological Differences. Despite the growth of the movement, significant divisions emerged among women. Generally, issues related to fair-employment practices, education, and political participation united women, but family and sexually related concerns, especially abortion and lesbianism, polarized women. Since many ERA supporters favored the right of women to choose an abortion, the two issues were soon linked. From the mid-1970's onward, strong antiliberation forces acted to stop passage of the ERA and pass legislation prohibiting abortion.

The movement itself became divided over tactics and style. Every group, whether traditional or radical feminist, educated its members and, on occasion, mobilized them for political participation. NOW, with an activist stance, combined these activities with marches, rallies, and involvement in political campaigns around the ERA and, at times, abortion rights. Smaller groups, often ad hoc, chose fasting and civil disobedience to call attention to their goals. These tactics usually were opposed by mainstream women's organizations.

All the groups within the women's movement have tended to see themselves as feminist, yet important, though often blurred, ideological distinctions obtain among them. In broad terms, groups like NOW and the traditional women's organizations have sought to share in the society as it is structured and expect some, but not many, changes. Marxist feminists have blamed women's problems on capitalism and a class-structured society and advocate an end to capitalism. Separatists, often lesbians, have claimed that women's situation will change only if women withdraw from male-formed structures. Radical feminists have seen women's situation as the result of biology and seek to change women's status through biotechnology and fundamentally restructured families and communities. Many socialist feminists have agreed with important elements of both the radical and Marxist critiques. However, they have advocated fundamental societal changes that will accommodate women's biological and social roles.

In the late 1970's and early 1980's most of the movement's organized activities were directed to the passage of the ERA. With the failure of the ERA to win ratification by 1982 and increased anti-abortion efforts, activists began to reevaluate their strategies. The failure of the movement to attract significant numbers of minority and poorer women was an important element in this analysis. Another factor was the desire of many women to combine feminism with some of the more traditional women's values.

Issues. The women's movement in the United States is composed of both national organizations and networks of local groups. The multi-issue agenda includes the ERA, equal pay for work of equal value, protection of gains, and equal participation in decision-making in every aspect of society. Increasingly, women are turning to political action to achieve these goals.

Politics. For advocates, the ERA is the constitutional underpinning that would ensure that women could not be discriminated against. Op-

ponents, such as the Eagle Forum, believe that the amendment would allow abortion, undermine the traditional family, and remove necessary protections for women. See also **EQUAL RIGHTS AMENDMENT**.

The ERA struggle demonstrated women's lack of political power. The amendment often became hostage to other issues. As a consequence, women's political participation increased. Census returns for 1982 indicated that 64.4% of all registered voters were women. By the 1980's, women had gained access to almost every public office. In 1981, Sandra Day O'Connor became the first woman to sit on the U.S. Supreme Court. The first woman vice-presidential candidate, Geraldine Ferraro, was nominated in 1984.

Surveys often reported a difference in the opinions of men and women on some social and political issues, particularly those involving war and peace. Not until the 1980's, however, did this "gender gap" become a significant political issue.

Education. The pursuit of equality in education followed two main tracks: increasing women's opportunities and changing the content of educational programs. Pressure from women's organizations such as WEAL resulted in Title IX of the Education Amendments of 1972, which prohibited discrimination based on sex in educational activities and programs funded by the federal government. Because of administrative regulations, court decisions, and local campaigns, Title IX in practice came to mean that if an educational institution accepted federal funds, all institutional discrimination had to end. This interpretation of Title IX was challenged when the Supreme Court ruled in *Grove City College v. Bell*, 1984, that Title IX was "program specific." Pending further clarification, many feared that only those programs receiving federal funds would be nondiscriminatory.

Programs have been developed to enable older women to start or return to college. Publicity and peer support as well as legal action have enabled more women to take advantage of vocational education and training for employment in higher paying, traditionally male-dominated fields.

Women's rights advocates have also worked to change teaching methods and materials. Feminist educators developed programs designed to enable teachers and administrators to become conscious of and change discriminatory practices. Courses and study material designed to demonstrate women's contributions to all spheres of life have been prepared.

Employment. Women's participation in the work force grew from 23 million in 1960 to over 49 million (53% of all women 16 and over) in 1984. During that time, women moved to overcome discrimination in employment opportunities, unequal pay and benefits, and unsatisfactory working conditions. Women have organized; built and used the resources of organizations such as the NOW Legal Defense and Education Fund; called for assistance from government agencies such as the Equal Employment Opportunity Commission (EEOC) and the U.S. Commission on Civil Rights; instituted law suits; and lobbied for necessary legislation.

Substantial progress has been made in eliminating requirements for skills or characteristics not essential for job performance. Legal action

and changing attitudes have increased the variety of positions open to women.

Women workers found that benefits packages might provide for discretionary surgery for men but deny pregnancy benefits to women. After a 1976 U.S. Supreme Court decision allowed the exclusion of pregnancy benefits from employee health benefit plans, Congress responded to the resulting outcry by passing the Pregnancy Discrimination Act of 1978, assuring some women of pregnancy benefits.

Women who are mothers have acted to create working conditions that recognize their multiple roles. Among the strategies devised, flexible work time, though still limited in scope, is becoming more common. Other strategies such as job sharing are looked upon as experimental or unrealistic.

The issue of equal pay for work of equal value is on the agenda for future action. Using standardized training and responsibility criteria, advocates have found substantial discrepancies in the salaries paid men and women for positions with similar scores. In *County of Washington v. Gunther* (1981), the U.S. Supreme Court ruled that women could sue for wage discrimination without having to prove that they were denied equal pay for jobs identical to those of their male co-workers. However, the Court declined to address specifically the comparable worth issue.

Abortion. Abortion has presented a particular challenge to the women's movement. This issue not only has mobilized the conservative opposition to the movement, but it has also divided the movement. In addition, the nature of the public debate has polarized the debaters, making little allowance for compromise.

With the 1973 U.S. Supreme Court decision in *Roe v. Wade*, the focus of activity shifted from the state to the federal level. Opponents, including the National Right to Life Committee, have sought to prohibit or limit abortions both directly and through the cutoff of federal funds. Proponents, including the National Abortion Rights Action League, have sought to maintain the status quo. Proponents have prevented the passage of legislation restricting abortion per se. Opponents have progressively restricted public funding, until by 1984 funding was available only if a woman's life was endangered.

Birth Control. During the early years of the women's movement, feminists sought successfully to end laws that restricted access to effective contraceptives. The debate then shifted to issues of health and safety. The contraceptive pill, first marketed in 1960, ushered in the sexual revolution.

Feminists continue to press for adequate testing of contraceptives with attention to the health effects of long-term use; the development of alternative, more convenient contraceptives; and the development of a chemical contraceptive for men.

Child Care. Adequate and affordable day care is a concern of many feminists. It is one issue that draws together women and men, feminist and nonfeminist alike. Experts believe that 6-7 million children go without care for a significant part of the day.

Inasmuch as children's needs vary with age, quality is difficult to define. In response to needs, some states certify home-based centers that usually provide care for six to eight very young children. Certification for larger centers

is a common requirement. Increased reports of child abuse in care centers indicate that evaluation criteria are inadequate.

Costs for center-based care can be prohibitive for some families. The cutback in Title XX of the Social Security Act funds in 1981 forced many low-cost centers to close. Due to the work of organizations such as the National Women's Law Center, some of the cutbacks have been balanced by increased tax credits.

Pointing out that adequate day care contributes to worker productivity, child-care advocates work to expand business involvement. Since child care as a benefit to employees can be treated as a tax credit to employers, more businesses are encouraged to establish on-site centers or voucher payment plans.

Family Life. As women took greater control of their lives, many assumptions about the relationships between men and women and family roles were challenged. Seeking a larger public role for themselves, women insisted that men take on more responsibility for caring for children and maintaining a home. Women's increased work-force participation increased their self-confidence.

For many men this was a difficult time, as the assumptions they took for granted were being attacked. Many made some effort to change, but others refused. Women learned to express their anger and also began to voice their own sexual needs. Marital tensions grew, and when they could not be resolved divorce often followed.

A slight drop in the divorce rate from a high of 5.3 per 1,000 population in 1981 was one sign of a renewal of family life. The increasing acceptance of feminist values by men and a renewed appreciation among women of traditional feminine values contributed to this new attention to family life.

Language and Media. Aware that language and media influence ideas about women, feminists have tried to change both. They have sought the use of gender-neutral or balanced language, with mixed success. Efforts to introduce new words, especially pronouns, have generally failed. The use of Ms. as an alternative for Mrs. or Miss is an exception.

An early campaign, which included a lawsuit, forced newspapers to drop gender designations in help-wanted advertisements. Women's complaints to advertisers and networks have resulted in some changes in the images of women in TV advertisement and programs.

The belief that issues primarily of importance to women are underreported in the media has been confirmed by studies. Despite the availability of adequate information, such issues have been ignored or inadequately reported. Many advocates of fairer reporting of women's concerns believe that the situation will change only when there are more women in decision-making positions.

THE BETTMANN ARCHIVE, INC.

Despite legal and social gains in the 19th century, women were generally considered to belong in the home.

WOMEN'S STATUS. Traditionally, women and men alike have accepted the fact that men have rights that women do not. Male behavior has been considered the norm, and women have been viewed, to some degree, as inferior. These attitudes are part of the stereotypes that shape thinking about women and women's behavior. Ultimately, they help determine women's status in society.

Through history, women have been labeled physically weaker than men, more emotional, less reasonable, less able to learn, and dependent. Although responsible for instilling civic and religious virtue in children, they themselves have been seen as susceptible to sin. Social customs and laws were developed to ensure that women fit these definitions. The occasional woman who did not conform was explained away or, more often, labeled a witch or a prostitute and punished.

Some of the stereotypes stem from women's childbearing, which, since it often was accompanied by poor nutrition, was debilitating. Nursing and child rearing have restricted women's activities. Childbearing alone, however, does not fully explain the pervasiveness of women's secondary status.

Whatever the sources, stereotypes and the attitudes they reflect are effective barriers to the changing of women's status. For this reason, many feminists have sought to identify and confront some of the more hurtful stereotypes.

Women have been defined as economically dependent, as homemakers and consumers, but not as producers. However, records show that women have always had economic roles. As farmers, fabricators, and service providers, they have contributed to both household and market. The failure of societies to acknowledge women's contributions has not only undermined women's status, but denied them necessary resources. In some developing nations even today, for example, women account for up to 80% of all agricultural production, yet they do not have ready access to new seeds, technology, or training.

Societies' needs and modern research are undermining some stereotypes. For example, the

need for mathematically competent workers has helped focus attention on girls' poor mathematical achievements. Studies indicate that mathematical and verbal abilities are linked to gender. However, the efforts made to accommodate the tendency of boys to be slow in acquiring verbal skills have not been matched by efforts to assist girls in acquiring mathematical skills. Furthermore, mathematically competent girls often have been discouraged from developing their skills.

Women's public decision making has often been dismissed as illogical, emotional, and subjective. Men's, on the other hand, has always been considered logical, rational, and objective. Psychologists and human-development specialists are accumulating evidence that women and men do tend to make decisions differently. Men tend to rely on objective standards, while women tend to pay much more attention to the impact of decisions on relationships. Researchers believe these differences are both inherent and the product of socialization.

The process of changing stereotypes and raising the status of women is slow and uneven. While the gains made by women in the United States generally are not matched by women in developing countries, they encourage changes in other places. The shift in societal roles because of economic changes, including economic development, also leads to an improvement in women's status.

HISTORY

In surveying the status of women through history, some common characteristics emerge. Women's status varies with both class and culture; no matter what the situation of elite women, poorer women have had to work hard and have received few societal benefits. Women make gains during periods of change, but these gains are not always secure. Finally, what is known about women is often based on the records and thoughts of men.

Ancient Greece and Rome. Women's status in the Western world has been shaped by Greek and Roman thought and by the Jewish and Christian religious traditions. In the world of classi-

cal Greece and Rome, men who were citizens had public responsibilities, and women were to bear children and manage households. In both cultures, poor women found ways to add to the family income, and peasant women worked in the field. However, significant differences existed between the two societies in the lives of citizen women.

In Athens, women were considered inferior to men. Although Plato argued that the most able women should be trained and educated to be leaders, the prevailing view followed Aristotle's belief that women should be passive, obedient, and silent. Ideally, women left their homes only to attend funerals and some religious celebrations. Legally minors, women had no control over the property that they could own and inherit. Wives were usually less well educated and significantly younger than the husbands who were chosen for them. Women did have a right to the return of their dowry if divorced, and they gained some independence with age.

Through time, Roman women gained the right to attend public functions and to conduct their own personal and business affairs. All but the poorest women received some formal education, and many elite women educated their own children. Although without political rights, some women wielded considerable political influence and, by the start of the Christian era, were having a say in the choice of emperor.

Prostitution was common in both Greece and Rome. Prostitutes had less restrictions than wives, and it has been suggested that some Roman women probably registered as prostitutes in order to gain freedom. The experience of slave women varied considerably. Some were intimates of their owners. Others received wages for their work, differing from their neighbors only by label. Still others were economically and sexually exploited.

Early Jewish Society and Early Christianity. Women in traditional Jewish society were viewed as wives and mothers. Ideally, they managed the household to increase its productivity and value. They could inherit property, but their contracts could be disallowed by fathers or husbands. Women were responsible for the religious training of their children yet had no public religious role.

Polygamy and divorce were allowed. Men and women were punished for adultery, women more severely. Menstruating women were avoided as unclean. Generally, men did not even talk with women who were not part of their families. Nevertheless, women were at times leaders, and wise women were respected.

Christian doctrine both praised women and blamed them for Adam's fall. Jesus welcomed women as well as men as followers. Saint Paul of Tarsus accepted women as spiritual leaders, but he taught that women should be subordinate to their husbands and should not preach or teach. Christianity held that though women were spiritually equal to men, practically, they were inferior and even sources of sin. Thus, virginity, first advocated as an opportunity for serving the church, became a means of avoiding sin and, in the case of men, avoiding women.

The Middle Ages. Christianity provided women with an acceptable alternative to marriage—religious communities. Originally informal groups gathered around a leader, by the 6th century these communities had become structured insti-

Changing needs of society affect women's roles. In World War II, women ordnance workers were actively sought.

tutions. Often established and supported by royalty, monastic communities gave women an opportunity to learn and to live a secure life amid the turmoil of the Middle Ages. Many abbesses, often women from upper-class families, became important civil as well as religious leaders.

As the Roman Empire disintegrated, women's status dropped. In the small states of Western Europe, women had few if any legal rights and, aside from the monasteries, no opportunities for education. However, the upheavals and wars of the Middle Ages left women with responsibilities for family and household, and some women began to sign contracts and appear in court.

Renaissance to the 18th Century. Beginning in the 15th century, women in the West have slowly gained rights and freedoms. In most instances, necessity forced women to change their behavior, then attitudes and laws acknowledged the changes.

Probably only a minority of women matched the societal ideal of mother and faithful wife. Most women were mothers but many poorer women probably did not marry. The legal and societal concerns with adultery and illegitimacy suggest that even among propertied persons, women's faithfulness in marriage was not taken for granted. Laws and attitudes supported a double standard.

Women as well as men shared in the learning of the Renaissance: learning, it was held, led to virtue. Educated women such as Isabella of Spain and Elizabeth I of England have been judged outstanding leaders by their peers and by history. Still, women were considered inferior, and the distribution of both education and power was narrow.

Trade, industry, and changes in agriculture drew people to towns and cities. Laws limited women's rights, but more women in trade and business signed contracts, managed property, and acted as their own agents. The shortage of

UNITED NATIONS FAO TORTOI

Women of developing nations often are responsible for cultivating crops in addition to rearing children.

work in the early stage of the Industrial Revolution resulted in pressures to limit women's work. Laws and guild regulations denied women access to apprenticeship programs. Nevertheless, women crowded into the growing cities and towns. Middle-class women could withdraw from the work force, but poor women were forced to accept harsh working conditions and low wages to survive. Young women were on their own; older women were often responsible for children. In Europe, the common age of marriage climbed from 21 to the current 25 to 28. Independent women—single, widowed, or abandoned—risked being put to death as witches, especially if they were healers.

Despite the barriers, education spread, in part because some Protestant sects held that everyone should be able to read the Bible. Migration to the colonies afforded women initial freedoms but also involved great peril. At the same time, women in England and elsewhere joined in political causes, the new nonconformist religions, and other social movements.

Gaining Rights. In the 17th century an occasional woman, often unmarried, spoke out for women's right to an education and a fair share of society's benefits. However, it was not until the late 18th century that women began to organize around their own concerns. Meanwhile, Rousseau and the Romantics held up the picture of women as fragile, domestic, and dependent.

In 1839 the Custody of Infants Act in England gave separated and divorced women custody of children under seven. Divorce reform came next in 1857, then property protection in the 1870's. In the United States, efforts to expand women's educational opportunities were suc-

ceeded by campaigns for legal reform. The suffrage movement followed. In northern Europe, meanwhile, women organized around issues of concern to unmarried mothers. By the mid-1920's, women in northern Europe, including England, and in the United States had the right to vote. Most women received at least a primary education.

Other Parts of the World. The history of the shifting status of women beyond the West is less well known. History and oral traditions name women leaders, in the Byzantine Empire and in India, for example. Other traditions identify women's roles and expertise; some suggest that women's roles, if not the individuals who filled them, were respected. The majority of the world's women have been workers as well as childbearers. Often, contact with the West increased their burdens. Western colonizers not only disdained indigenous people and customs, they failed to recognize women and their activities. African women farmers lost land rights when European-inspired laws required deeds to have a male owner's name. The education gap between women and men increased as boys gained access to Western-modeled education systems and girls did not. This was especially true in Islamic nations, where custom required that females be confined to the household.

The U.N. Commission on the Status of Women was established in 1948. It initiated plans for International Women's Year (IWY; 1975). Together with the U.N. Decade for Women (1975–1985) and the three U.N. Conferences related to the Decade (Mexico City, 1975; Copenhagen, 1980; and Nairobi, 1985), IWY represented the first worldwide effort to enhance the status of women. It raised questions about women's status before national and international decision makers. The Decade provided the occasion to meet some of women's basic needs, publicize women's many contributions, gather needed data, and organize and empower women. Many nations established national mechanisms to promote women's interest.

CONTEMPORARY STATUS OF WOMEN

United States. The decision of the Democratic party to name a woman as a vice-presidential candidate in 1984 is one indication of the improved status of women in the United States. Long active as party workers, women gradually began to receive influential political positions. The number of women in public office tripled between 1973 and 1984.

Legal Gains. The change in women's political status has been matched by changes in other areas. Despite the absence of an Equal Rights Amendment (ERA), women have gained many legal rights. Since the early 1970's, Supreme Court rulings based on the 5th and 14th Amendments of the Constitution have prohibited sex-based distinctions on the part of government, except when they "serve important governmental objectives. . . ." (*Craig v. Boren*; 1976).

Court rulings have been accompanied by legislation giving women more rights, benefits, and public responsibilities. Reforms in federal tax laws have eliminated estate and gift taxes on transfers of property between spouses. It was assumed until the 1970's that property registered in a husband's name was solely the result of his efforts. Therefore, wives paid higher estate taxes than their husbands would have paid. Re-

forms enacted in 1976 allow homemakers to establish Individual Retirement Accounts and provide for tax deductions for child care. Later legislation protects the pension and social-security rights of women whose benefits are based on their spouse's earnings. Lifelong homemakers, however, are not directly covered by Social Security.

Federal laws prohibit credit discrimination. State laws excluding women from jury duty were held unconstitutional, as were practices that discriminate against women in the rental or sale of property. Laws requiring that a woman's domicile be that of her husband's were overturned, and court rulings have supported women who keep their own name in marriage.

Employment. Legislation, agitation, and determination have removed many, but not all, employment barriers. The Equal Pay Act of 1963 and the Civil Rights Act of 1964 provide for equal treatment of men and women. Title II of the Education Amendments of 1976 and the Job Training Partnership Act of 1982 enabled women to compete for nontraditional jobs. A combination of legislation and court rulings prohibits discrimination because of pregnancy, protects women's job security when they take leave because of pregnancy, and eliminates other restrictions unrelated to the specific job.

Statistics reveal that many women have taken advantage of the opportunities available. The percentage of women becoming lawyers, economists, postal mail carriers, and machinists at least doubled between 1975 and 1985. According to the Women's Bureau of the U.S. Department of Labor, 22% of all working women in 1984 had better paying, managerial, and professional jobs.

Despite these advances, however, three fourths of all women in the work force are employed in women-dominated, low-paying, service, clerical-administrative support, and sales jobs. The reasons for this discrepancy are many. Women are often judged by stricter criteria and harassed if they move to new roles. Women's expectations and attitudes about work and the job preparation they receive are also factors. Women are still underrepresented in many training programs. In July 1982 the Department of Labor reported that women accounted for only 6% of all registered apprentices.

Education and Research. Educational opportunities for women in the United States have expanded considerably. In 1981, women earned just under half of all B.A.'s and half of M.A.'s granted. However, women earned only 31.1% of all Ph.D.'s and 25.2% of all first professional degrees. Significant differences exist between the secondary-school mathematics and science education of boys and of girls. These differences, like those between women and men in job training and apprenticeship programs, limit the future employment potential of girls.

Questions raised by feminists and the research interests of feminist scholars have stimulated the development and growth of women's studies. Looked upon with much skepticism when first introduced, the field of women's studies has become a respected interdisciplinary area of study in many colleges and universities.

As women have gained status, they have influenced research practices, stressing the importance of gender as a category in tabulating data. Medical, psychological, and developmental dif-

Legislation and changing attitudes have enabled women to compete for jobs in such nontraditional areas as carpentry.

ferences between men and women, previously ignored or explained away to the disadvantage of women, are now carefully examined.

Despite the education and research gains made by women, barriers remain. New research findings are integrated into curricula very slowly. Sex-role stereotyping still influences the courses and career counseling offered young people. Subtle discrimination as well as negative social attitudes, lack of successful role models, and inadequate preparation serve as barriers to women's entering into fields such as engineering and business.

Family Roles. Family roles are also changing, although the rate of change is slower. Decreasing family size has contributed to and enabled other changes. The average age at which American women marry for the first time has risen to 22. An increasing number of women are having their first child after age 30. At the same time, women are seeking to integrate tradition and equality in ways that support both women and families.

Modern American men commonly share in child care and other household tasks. However, evidence indicates that men's child care tends to center on the more pleasurable activities, such as recreation. The husband's contributions in the household usually do not match the wife's, even if both work outside the home. Women, even those who work, balance their usually lesser economic contribution by being primarily responsible for the smooth running of the household. As a consequence, women's total work day tends to be longer than men's.

Violence and Poverty. Amid the positive indicators of women's increased status are two impor-

tant negative ones. The incidence of violence against women, including rape and wife abuse, is high. Even if the increased willingness of women to report rape and abuse is taken into account, violence against women seems to be increasing.

Poverty is also a women's issue. The number of single-parent, female-headed households grew from 10.8% to 18.8% of all families between 1970 and 1981. Female-headed households accounted for over half of all poor families in 1981. And despite the advances made in protecting pension and social-security rights of women, more women than men over age 65 have incomes below the poverty level.

Other Countries—Europe. Scandinavian countries have done much to promote the status of women. Laws, for example, provide for paternity as well as maternity leave. Still, changes in traditional roles are slow. In other parts of Western Europe, women are primarily homemakers and mothers. Women in the work force are usually paid less than men. Cottage industries provide more women with the opportunity to earn an income, but this practice raises many questions about increased exploitation of women.

In Eastern Europe, an official policy of equality is contradicted in practice. Usually, women who are in the work force full time receive no household help from their husbands. Labor-saving appliances are few, and shopping especially is time consuming.

Developing Countries. At present, women in developed nations have acquired status close to that of men, though their gains are not secure. In contrast, most women in developing nations are still looked upon as inferior and are denied many social benefits. Educated, upper-class women occupy prestigious positions and have status. Poor women, especially rural women, are confined by traditional attitudes and structures. Although educational opportunities are available, barriers ranging from responsibility for younger siblings to fear of corruption from schooling prevent most girls from going to school. Training and informal education are enabling poor women to increase their family status through increased earnings.

The worldwide concern with socioeconomic development beginning in the 1950's has focused some attention on the role of women in the development process. Women bear a disproportionate burden in this process. Although the overwhelming number of women in developing countries are rural workers, a growing number are engaged in the assembly of electronic goods, toys, and appliances as well as in garment making. Rural women have lost traditional support systems as men migrate to cities, and they are often denied access to new resources. Industrial workers are hired in their mid-teens, work under adverse conditions, and lose their jobs by their mid-20's. The powerlessness of these women is shared by those women and children who constitute the bulk of the growing number of refugees.

WONDERS OF THE WORLD. See SEVEN WONDERS OF THE WORLD.

WONSAN, wun'sān', a city in North Korea and capital of Kangwon province. Lying at the head of East Korea Bay, Wonsan has a fine natural harbor protected by a screen of islands. The sea and a mountain belt that lies behind the city have a moderating effect on the generally harsh climate. Wonsan is the center of North Korea's fishing (pollack, herring, cod, salmon) and fish-processing industries. It is also an important terminal for both maritime and domestic commerce.

The port was first opened to foreign trade in 1880, and rail lines linking Wonsan with Pyongyang and Seoul, as well as east-coast ports, were completed one after another from 1914. These facilities, together with Wonsan's industries (ship-building, oil refining, smelting, rice cleaning, brewing), were almost totally destroyed in the Korean War (1950–1953), but the city was rebuilt and new industries established (locomotive works, bricks, ceramics). Wonsan is a leading tourist and recreational center. Population: (1967 est.) 215,000.

EDWARD W. WAGNER, *Harvard University*

WOOD, Anthony (1632–1695), English antiquary and biographer. He was born in Oxford on Dec. 17, 1632, and attended Merton College, Oxford, where he received an M.A. degree in 1655. He then began his lifelong career devoted to the history of the university. Wood wrote his history in English, assisted by John Aubrey and others, and the newly founded university press agreed to publish the work, but only in Latin. It was translated with the help of John Fell, dean of Christ Church, and issued in 1674 as *Historia et Antiquitates Universitatis Oxoniensis*. The English version, *The History and Antiquities of the University of Oxford*, was not printed until 1792–1796.

Wood's chief claim to fame, *Athenae Oxonienses*, an account in English of distinguished personages educated at Oxford from 1500 to 1690, appeared in 1691–1692. Because of its criticisms of Edward Hyde, 1st earl of Clarendon, which were derived from Aubrey's notes, Wood was expelled from the university in 1693.

In his later years, Wood affectingly styled his name Anthony à Wood. He died in Oxford on Nov. 29, 1695.

WOOD, Fernando, American politician: b. Philadelphia, Pa., June 14, 1812; d. Hot Springs, Ark., Feb. 14, 1881. He was educated at a private school in New York City and prospered as a ship Chandler and merchant. Active in Democratic politics as a member of Tammany Hall, he served in Congress (1841–1843) and, after being defeated for mayor in 1850, was elected in 1854 and 1856. He was at odds with the state legislature, which cut his second term in half, and was ejected from Tammany Hall in a patronage quarrel. Forming a rival organization, Mozart Hall, he won a third election as mayor in 1859. In January 1861 he proposed to the common council that New York secede from the state and become a free city, drawing its revenues from a tariff on imports.

Before the Civil War, Wood was pro-Southern in his views. When fighting began, he equipped

several Union regiments, but later he opposed the war. Defeated for reelection as mayor, he was sent to Congress in 1863 and was a spokesman for the Peace Democrats, calling for conciliation with the South. He was elected to Congress again in 1867 and served until his death. He spoke for the bankers and merchants, advocating a lower tariff and a refunding of the national debt. He was recognized as a leader of the minority party and after 1877 was majority whip and chairman of the Ways and Means Committee of the House. Wood was a brilliant and masterful political organizer, and many of his ideas on the subjects of administration, sociology, and economics were advanced for his time.

WOOD, Gar (in full **GARFIELD ARTHUR WOOD**), American speedboat racer and industrialist: b. Mapletown, Iowa, 1880. He earned a fortune from several of his inventions, notably a hydraulic hoist, and became chairman of Gar Wood Industries, Inc. One of the world's outstanding sportsmen, Wood was instrumental in popularizing speedboat racing. He won the most coveted American trophy for hydroplane racing, the Gold Cup, four times (1917, 1919-1921), setting a record in 1920 (70.0 miles per hour) which remained unbroken for a quarter century. Also in 1920, driving his *Miss America I*, he won the Harmsworth Trophy, and he repeated his victory in seven of the following eight international competitions for it. In 1932, he drove his *Miss America X* over a one-mile course at an average speed of 124.86 miles per hour, the United States record until 1949. After winning the Harmsworth Trophy with this craft in 1933, he retired from competitive racing. He died in Miami, Florida on June 19, 1971.

WOOD, George Bacon, American physician: b. Greenwich, N.J., March 12, 1797; d. Philadelphia, Pa., March 30, 1879. He graduated from the medical department of the University of Pennsylvania in 1818. He was a professor at the Philadelphia College of Pharmacy from 1822 to 1835 and at the University of Pennsylvania from 1835 to 1860, also serving as president of the American Medical Association in 1855-1856 and of the American Philosophical Society in 1859-1879. He wrote *Treatise on the Practice of Medicine* (1847) and, with Franklin Bache, *The Dispensatory of the United States* (1833), both of which were published in many editions. The University of Pennsylvania was endowed with an auxiliary faculty of medicine and was bequeathed a botanical collection by Wood.

His nephew, **HORATIO CHARLES WOOD** (1841-1920), was graduated in medicine from the University of Pennsylvania in 1862 and was professor there from 1866 to 1906. The author of hundreds of scientific papers, he worked in the fields of botany, entomology, nervous diseases, experimental medicine, and medical jurisprudence. His *Treatise on Therapeutics* (1874) became the standard English work on the subject, and in 1884-1900 he was the editor of the *Therapeutic Gazette*.

WOOD, Grant, American painter: b. Anamosa, Iowa, Feb. 13, 1891; d. Iowa City, Feb. 12, 1942. As a farm boy, he often took charcoal from the kitchen stove to draw on brown paper or a cracker box. After the death of his father in 1901, the family left the farm for Cedar Rapids, where Grant attended and completed high school. He

later studied under Ernest Batchelder at the Minneapolis Handicraft Guild for two summers, attended a few art classes at the State University of Iowa, and took night classes at the Art Institute of Chicago. In 1923 he studied at the Académie Julian in Paris. After returning to Iowa he received a \$10,000 commission in 1927 for a stained glass window to be placed in the Cedar Rapids Memorial Building. He produced the window in Munich, where the best stained-glass workers were to be found. While there, his interest in 15th and 16th century German and Flemish painting, in the 19th century realist Wilhelm Leibl, and in Otto Dix, a contemporary artist active in the *neue Sachlichkeit* or "realist" movement, enabled him to fix in his mind the hard, stylized but still realistic style in which he wished to work.

Grant Wood

Associated American Artists

His first paintings in the new style were *John B. Turner—Pioneer* (1929) and a portrait of his mother entitled *Woman with Plants* (1929, Cedar Rapids Art Association). In the fall of 1930 his reputation was established, almost overnight, by the Chicago showing of his *American Gothic* (1930, Art Institute of Chicago), a stark canvas which portrays an Iowa preacher-farmer and his daughter standing in front of a house with a Gothic window. In Wood's mind, these figures (for which his sister and his dentist had posed) represented not simply Iowa farm folk but the serious, sober, dependable small-town people who form the solid base of American life. In this respect, the painting was unlike his *Daughters of Revolution* (1932), a satirical work that was interpreted as a stab at smugness. It was intended to deflate those members of patriotic organizations who placed pride of ancestry above personal achievement.

Wood subsequently directed an Iowa Public Works of Art project and taught at the State University of Iowa, meanwhile continuing to paint and sell his works. Representative among the later canvases were *Dinner for Threshers* (1934, Whitney Museum, New York), *Parson Weems' Fable* (1939), and *Spring in Town* (1941, Terre Haute, Ind.). When cancer ended his life, on the eve of his 51st birthday, Wood was at the peak of his fame as a painter of the American scene.

FREDERICK A. SWEET,
Curator of American Painting and Sculpture, The Art Institute of Chicago.

WOOD, Mrs. Henry (nee **ELLEN PRICE**), English novelist: b. Worcester, England, Jan. 17, 1814; d. London, Feb. 10, 1887. From her girl-

hood, she suffered from curvature of the spine, which partially invalidated her. After she married Henry Wood, a banker and consular official, in 1836, she lived abroad for most of the following 20 years and began her literary career by contributing stories to *Bentley's Miscellany* and the *New Monthly Magazine*. The most successful of her more than 30 novels, *East Lynne* (q.v.), appeared in 1861, and in 1862 appeared two other popular works, *Mrs. Halliburton's Troubles* and *The Channings*. In 1867, she became editor and proprietor of *Argosy Magazine*, where her "Johnny Ludlow" stories appeared. Though melodramatic and slipshod, Mrs. Wood's works are characterized by ingenuity of plot and vivid depiction of character.

WOOD, Sir Henry Joseph, English conductor: b. London, England, March 3, 1869; d. Hitchin, Hertfordshire, Aug. 19, 1944. After appearances as a musical child prodigy, he began conducting opera in 1889. His first series of Promenade concerts at Queen's Hall, London, began on Oct. 6, 1895. Becoming a popular feature of English musical life, they continued with brief interruptions for 49 years, his last concert being heard on July 28, 1944. Wood conducted widely elsewhere, composed under the pseudonym of Paul Klenovsky, and made successful arrangements of music for orchestra. In 1918 he refused an offer to succeed Karl Muck as conductor of the Boston Symphony Orchestra. He was knighted in 1911 and given an honorary degree of Doctor of Music by Oxford University in 1926.

HERBERT WEINSTOCK.

WOOD, Jethro, American inventor: b. March 16, 1774; d. Ledyard, N.Y., Sept. 18, 1834. He was born either in Dartmouth, Mass., or in White Creek, Washington County, N.Y., where his family settled before 1783. He married in 1793 and, about seven years later, moved to a farm near Poplar Ridge in the town of Ledyard, Cayuga County, N.Y. He first patented a cast-iron plow in 1814, but was not satisfied with it and patented a perfected plow on Sept. 1, 1819, a few months after Stephen McCormick's similar patent in Virginia. The cast-iron parts of Wood's plow were standardized and replaceable; the plow itself was light, had good balance, and was cheap to manufacture. Most important, perhaps, were Wood's improvements in the shape of the moldboard and other parts. His designs were widely copied in the northern states and contributed to the development of farming machinery.

JOSEPH H. JACKSON.

WOOD, John, English architect: b. Yorkshire, England, 1705?; d. Bath, May 23, 1754. Wood began his career as a roadbuilder, and it was not until 1728 that he exercised his gift as an architect in the construction of Wiltshire's Assembly Rooms, where the society of Bath gathered for breakfast before bathing. This initial success, furthered by Richard Nash, who wanted to establish Bath as a holiday center for the fashionable world, led Wood into a series of architectural creations in the city: the North and South parades (1728), Queen Square (1729), St. Mary's Chapel (1732), the Royal Mineral Water Hospital (1738), and Prior Park (1742), built for Ralph Allen of the local honey-colored stone. Wood's architecture was classical in design and set a standard for the planning of streets and groups of buildings.

His son, **JOHN WOOD, JR.** (d. 1782), shared in his father's work and completed several plans conceived by the elder Wood: the Circus (1764), a circle of houses in Palladian style which sheltered such celebrities as the Duke of Bedford, the Earl of Chatham, Lord Clive, and Thomas Gainsborough; the Royal Crescent (1767-1769), a classical semiellipse of 30 houses with a coherent, pillared facade; and the Hot Bath and the Royal Private Baths (1776). From his own designs the younger Wood also constructed the buildings on three full streets: Kelston Park (1764), Alfred (1768), and Belmont (1770).

DONALD B. CLARK.

WOOD, Leonard, American soldier and administrator: b. Winchester, N.H., Oct. 9, 1860; d. Boston, Mass., Aug. 7, 1927. Wood grew up in the Massachusetts seashore village of Pocasset and attended Pierce Academy in Middleboro. He entered the Harvard Medical School in 1880, received an M.D. degree in 1884, and, after a brief practice in a Boston slum, joined the Army Medical Corps. Upon reporting for duty in Arizona, he immediately saw action in the successful campaign against the Apache chief Geronimo (1885-1886), not only as a physician but also as commander of troops, for which he later received a Medal of Honor. He served subsequently in California and in Eastern states, and in 1895 was assigned to Washington, D.C., where he was to become White House physician to William McKinley.

In Washington he also formed a close friendship with Theodore Roosevelt, who was then assistant secretary of the Navy. As members of the imperialist faction within the Republican Party, they brought pressure on President McKinley to declare war on Spain and, after the outbreak of war in April 1898, organized the First United States Volunteer Cavalry, popularly known as the Rough Riders. Commissioned a colonel, Wood took command, with Roosevelt second in command. The Rough Riders played a prominent role in the invasion of Cuba, and Wood's command was enlarged to include regular cavalry regiments at San Juan Hill. He won a battlefield promotion to brigadier general. After the capture of Santiago de Cuba, he was appointed governor of the eastern sector of the country. His success was such that he was promoted to major general of volunteers and, on Dec. 5, 1899, became military governor of all of Cuba, continuing in this post until the Cuban republic was established and power was transferred to an elected Cuban government on May 20, 1902.

Wood's energy and efficiency as governor attracted much favorable notice. He imposed sanitation measures, built sewage disposal systems, constructed highways and railway lines, and devoted one quarter of Cuba's revenue to the establishment of public schools. Reforming the judicial and electoral systems, he laid the basis for subsequent democratic government. When Walter Reed, then conducting research in Havana, discovered the cause of yellow fever, Wood began a campaign to eradicate mosquitoes. Decades later, the Cuban government was to show its appreciation of his services by voting a pension to his widow.

Early in 1903, Wood was assigned to pacify Mindanao in the Philippines. Appointed governor of Moro Province, he crushed opposition to American occupation and introduced Americanizing re-

orms, but he was criticized for the heavy death toll inflicted on the Filipinos, including women and children, during the course of his campaigns. In August 1903 he was made major general in the Regular Army, despite protests against the promotion of a "medic" over the heads of more than 500 officers. He was the commander of the Army's Philippine division from 1906 to 1908 and then returned to the United States, where he commanded the Department of the East (1908-1910, 1914-1917) and was chief of staff (1910-1914). When World War I began, he and Roosevelt campaigned for military "preparedness," established civilian officer training camps at Plattsburgh, N.Y., and criticized the administration of Woodrow Wilson for slowness in making war preparations.

After the United States declared war against Germany in 1917, President Wilson bypassed Wood in favor of John J. Pershing for command of the American Expeditionary Force. Wood organized and trained the 89th and 10th divisions but was summarily relieved of command on the eve of the departure of the 89th for Europe. He was awarded a Distinguished Service Medal, but Wilson's adamant refusal to let him take part in the fighting made Wood the hero of Wilson's bitter critics.

Wood was military in his bearing and conduct, loved strenuous physical exercise, possessed great energy and capacity for work, and was extremely ambitious. His public personality was not warm and expansive, but his courage, sincerity, and strength of conviction attracted a devoted personal following. When Roosevelt died in January 1919, Wood became his heir as the leading candidate for the 1920 Republican presidential nomination. His campaign speeches emphasized military preparedness and suppression of radicalism. While liberals were disappointed by his lack of a social and economic program, some businessmen contributed huge sums to his campaign. Wood refused, however, to accept the military hero's traditional role as a front man for professional politicians. He won victories in the primaries and led on the early ballots at the Chicago convention, but sternly rejected offers from Senator Boies Penrose and certain influential oil men to give him the votes necessary for nomination in exchange for the privilege of naming cabinet members. In the famous "smoke-filled room," the party regulars denied him the nomination and, instead, chose the complaisant Warren G. Harding (whose administration was clouded by scandal).

In 1921, Harding appointed him governor general of the Philippines. Advising that independence be postponed, Wood reversed the movement toward self-government with firm rule. He was largely successful in restoring public finances and improving economic conditions, but was bitterly criticized by independence forces. He died after his third operation for a brain tumor which had produced a pronounced limp at various periods of his life. In reporting his death, the *New York Times* called him "America's great pro-consul."

WESLEY M. BAGBY,
West Virginia University.

WOOD, Mary Elizabeth, American librarian: b. Elba, N.Y., Aug. 22, 1861; d. Wuchang, China, May 1, 1931. While visiting her missionary brother in China in 1899 she became interested in Boone College in Wuchang and remained there

to work. She enlarged the college library, helped to establish traveling libraries, and in 1920 founded a library school at Boone. She also assisted in sending young Chinese to the United States for education.

In 1923 she began crusading for Chinese national libraries, working tirelessly in Washington to secure passage of a bill designating the unassigned portion (about \$6 million) of the Chinese Boxer Rebellion indemnity to educational and other cultural uses in China. Miss Wood spent the rest of her life enlarging the endowment of Boone and effecting various humanitarian projects on behalf of the Chinese.

VIVIAN PRINCE.

WOOD, Robert Williams, American physicist: b. Concord, Mass., May 2, 1868; d. Amityville, N.Y., Aug. 11, 1955. After graduating from Harvard University in 1891, he studied at the universities of Johns Hopkins, Chicago, and Berlin (1891-1896). He joined the faculty of the University of Wisconsin in 1897, became professor of experimental physics at the University of Johns Hopkins in Baltimore in 1901, and was research professor after his retirement in 1938. His work in optics and spectroscopy was especially important, and he conducted significant research on the physical properties and biological effects of ultrasonic waves, explored the properties of ultraviolet and infrared radiation, and improved diffraction gratings; he was awarded many medals for his work on the diffraction method in color photography. In World War I he was a major in the Signal Corps and originated a secret signaling system. He was a consultant during World War II for the Manhattan Project, which led to development of the atomic bomb.

His publications are quite diverse and include a book of illustrated humorous verse, *How to Tell the Birds from the Flowers, A Manual of Flornithology for Beginners* (San Francisco 1907; rev. ed., New York 1917); *Researches in Physical Optics*, 2 vols. (New York 1913-19); *Physical Optics* (New York 1905; rev. ed., 1934); and *Supersonics, The Science of Inaudible Sounds* (Providence, R.I., 1939).

WOOD, Thomas John, American soldier: b. Munfordville, Ky., Sept. 25, 1823; d. Dayton, Ohio, Feb. 25, 1906. He graduated from West Point in 1845, served under Gen. Zachary Taylor in the Mexican War, and remained active on frontier duty until the outbreak of the Civil War, rising through the ranks to a colonelcy in 1861. As a Union brigadier general of volunteers in 1862, he led an Indiana brigade and then a division. At Chickamauga in September 1863, the controversial removal of his division from the line opened the way for a Confederate penetration, but he redeemed himself at Chattanooga in November when his division spearheaded the capture of Missionary Ridge. Despite a severe leg wound suffered in the fighting around Atlanta in 1864, he continued commanding his troops and won high praise from Gen. William T. Sherman, the commander of the Union forces advancing eastward to the Atlantic coast. He was appointed major general of volunteers immediately after the war and retired from the Army in 1868.

WOOD, Thomas Waterman, American artist: b. Montpelier, Vt., Nov. 12, 1823; d. New York, N.Y., April 14, 1903. At the age of 23 he went

to Boston and studied under the portrait painter Chester Harding. In the years following, he practiced this art form in Quebec, Washington, D.C., New York City, and Baltimore. He went to Europe in 1858 for further study, remaining there for two years. From 1861 to 1866 he worked in Nashville, Tenn., and Louisville, Ky., as a portrait painter, then settled in New York City, where he became prominent as a genre painter. In addition to his New England scenes, Wood is remembered for his portrayals of the American Negro at the time of the Civil War. Three of his paintings, *The Contraband*, *Recruit*, and *Veteran* (composing a unit entitled *War Episodes*), are in the Metropolitan Museum of Art in New York. He served as president of the American Water Color Society (1878–1887) and of the National Academy of Design (1891–1899). The Wood Gallery of Art, which he founded in 1895 in his home town, houses his copies of European masters as well as some of his original works.

WOOD, the hard, fibrous substance between the pith and bark of trees. More specifically, it may be defined as the lignified, water-conducting, strengthening, and storage tissues of branches, stems, and roots of trees. Technically, it is known as xylem.

The chief product of the forest, wood is a universally useful raw material. From prehistoric times it has been used as a source of heat and as material for shelter and construction. As civilization advanced, it assumed major importance as material for boatbuilding, for piling to support docks, wharves, and piers, and for crossties to carry the world's railroad tracks. In modern times, with the advance of wood chemistry, wood's uses have become legion, extending to such varied and important products as paper, textiles, plastics, and hundreds of chemicals and extractives.

With the development of heat- and moisture-resistant glues, plywood and laminated wood have in some products superseded metallic and ceramic materials. Compressed wood has replaced some metals for gears and die casts. Wood's versatility has been demonstrated in Europe by its use in emergency wartime conditions as a source of wood gas for propelling automobiles. Similarly, clothing has been made from wood cotton and wood wool. Wood also provides material for the manufacture of animal foods.

Because it is renewable, is available at relatively low cost, and has such a variety of structural, ornamental, aesthetic, insulating, and chemical properties, wood is considered by many mid-20th century observers to be the most important raw material of the future, exceeding even the metals, oils, and rubber.

Wood properties, processing, chemistry, and products are discussed in the following sections:

1. Introduction

There are two parts of the main stem of a tree: (1) the outer part, next to the bark, called sapwood, which is the living and physiologically active wood and is generally of pale color; and (2) the inner core, composed of nonliving cells, called heartwood, and generally darker in color.

The latter performs the function of support and has a lower moisture content and is generally harder and more durable than the sapwood. As a tree grows larger and older, the proportion of heartwood increases and forms a very large part of the stem.

All woods are classified for commercial purposes as: (1) softwoods, known also as conifers or evergreens, and (2) hardwoods, which are generally deciduous and have broad leaves. These are not classifications of hardness, since some hardwoods, such as basswood and poplar, are much softer than some conifers. The reverse is also true. There are more than 1,000 separate species of woods in the United States and Canada. Only about 60 are of great importance. The conifers, such as pines, fir, spruces, redwood, cedars, and cypress, produce most of the lumber used in construction, as well as many other forest products, such as pulp, paper, and plywood. There are more species of hardwoods than of conifers; the hardwoods are largely specialty woods, used primarily for furniture, flooring, paneling, crossties, handles, tools, and many other purposes. Oak, maple, beech, birch, red and black gum, yellow poplar, ash, basswood, black walnut, hickory, and black cherry are among the prominent and most useful hardwoods.

Trees grow in height and diameter each growing season by taking moisture and nutriment from the soil and elevating them to the leaves where, by a process known as photosynthesis, the chlorophyll converts them into food elements. These proceed down the stem and add a layer of wood known as the annual ring. Thus some trees may grow rapidly, depending upon climate, soil, moisture, and food elements, up to $\frac{1}{8}$ to $\frac{1}{2}$ inch in diameter per year or more; whereas some may grow at the rate of only $\frac{1}{4}$ to $\frac{1}{2}$ inch in 10 to 15 years or more. Through scientific forestry, the objective is to grow timber crops of the better and more valuable species as rapidly as possible. This process is known as silviculture.

The wood of each species differs in its structure, fiber length, pores, color, and other characteristics. Under the microscope and especially when cut in cross section, these differences form the means of identification. However, the more common species can readily be identified without instruments by their appearance, weight, color, grain, and character defects, such as mineral stain, checks, knots, and pitch pockets.

Advantages of Wood.—The advantages of wood as a material may be summarized as follows:

(1) In proportion to weight, wood is stronger than other materials of wide availability and use, including steel.

(2) Wood is worked easily with tools and lends itself to manufacture and fabrication into many shapes, sizes, and designs.

(3) Wood is an excellent nonconductor of heat, so that it has a special value in making dwellings warm in winter and cool in summer. In cold climates, the frame dwelling, properly built and insulated, is the warmest type of home.

(4) Its grain and appearance render it susceptible to artistic and architectural designs—thus adding to the beauty and attractiveness of furniture, interior and exterior finish, paneling, flooring, and other items.

(5) Lumber is comparatively inexpensive—a further reason for its almost universal use for many structural purposes.

(6) Wood is abundantly available in many

shapes, sizes, and forms, and is a renewable resource. With the widespread adoption of intelligent forest management policies, ample supplies can be grown and are foreseeable for the future.

(7) The use of timber connectors in wide trusses and spans, towers, and general construction permits the utilization of smaller wood members, thus making some forms of timber construction very economical.

(8) Development of methods for making wood fire resistant, through impregnation of the fibers with a fire retardant, have increased wood's usefulness as a structural material, particularly for some interior construction. Wood is readily insurable at relatively low rates. Heavy timber construction, known as mill construction, enjoys a lower fire insurance rating than steel construction.

(9) Wood does not deteriorate in value if properly handled and protected.

(10) It is not readily affected by changing styles.

(11) It has a prompt resale value.

(12) Heat, cold, or climatic changes do not seriously affect it.

2. Properties

Technical Properties in Relation to Uses.

Wood varies widely in its composition, structure, and technical properties. Some species, such as southern pine and Douglas fir, are strong, stiff, hard, durable, abundantly available, and relatively inexpensive. They therefore make excellent multipurpose construction timbers, lumber, crossties, and other products where these qualities are important. Douglas fir, occurring in large sizes, is also an excellent wood for veneers and plywood. The soft pines, particularly the white pine, Idaho or western white pine, sugar pine, and ponderosa pine, are very soft, even textured, close grained, and workable, and therefore are widely used for doors, sashes, boxes, interior finish, foundry patterns, and flasks. *Lignum vitae* is one of the heaviest and hardest woods, and is in great demand for bowling balls. Balsa wood, growing extensively in Ecuador and Peru, is even lighter than cork, and is widely used for some highly specialized purposes, such as airplanes and life rafts. Teak from Burma is regarded as the best wood for certain shipbuilding purposes, such as decking, because it seasons well and warps and twists very little. Quebracho wood from Brazil and Paraguay is another of the heaviest and hardest woods, and is used in South America for crossties and as a source of tannin to condition leather. Oak is hard and heavy, is the most important wood used for crossties, and makes fine furniture. White oak, being impervious to liquids and without disagreeable odors or flavor, is in great demand for barrels and other tight cooerage.

The cedars, cypress, and redwood, which are exceedingly durable, light in weight, and readily converted, make excellent siding, poles, exterior trim, shingles, posts, and even crossties for railroads on which traffic is infrequent or rolling stock light. Spruce has long, strong fibers, is relatively free from resinous and gummy substances, and therefore is adaptable for the production of pulp and paper. Yellow poplar is soft and workable and seasons well, and is popular for many woodworking and finishing purposes; it is also widely used for plywood cores. Basswood, which is light in weight, soft, white colored, and

possesses excellent working qualities, is used for fine quality boxes and for Venetian blinds, moldings, novelties, picture frames, and excelsior. Elm is tough and useful for such items as barrel hoops and hockey sticks.

Black walnut, black cherry, and mahogany season well, possess attractive figure, color, and grain, and are premier woods for furniture, interior finish, cabinetwork, and the like. Curly and bird's-eye maple are also specially prized as cabinet and furniture woods. Quartered oak, red gum, and sycamore present a striking and pleasing grain or silvery sheen which attracts premium prices. Willow is light in weight and makes a good artificial limb. Hickory is strong, tough, and pliable, and therefore makes some of the best skis. Ash is strong for its weight and straight grained, and makes excellent handles for rakes, hoes, and other tools, as well as baseball bats. The longleaf pine of the South yields a large amount of resin when tapped and is the source of rosin, turpentine, and other chemical products. The sugar maple provides a sap which is converted into sugar and a sweet sirup. The bark of the cinchona tree produces quinine. Rubber is obtained from the milky sap or latex of the rubber tree.

Each species varies widely in its growth rate, weight, and usefulness even within each tree. Cherry in some regions has excessive gum pockets, which tend to degrade the lumber and lower its value. Butt logs, or those cut from the base of the tree, contain in most species the best wood and are freest from defects. Therefore they yield the clearest and most valuable boards. Top logs may be of lower value because of excessive number and size of knots and other defects. Some species check and split readily on exposure to the air after manufacture or crosscutting. Sapwood differs from heartwood in its chemical composition, moisture content, and appearance. Sapwood in some species, such as redwood, western red cedar, catalpa, and yew, is relatively very narrow, whereas it is comparatively wide in such species as maple, ash, hickory, beech, and some of the pines.

Second-growth timber generally contains larger proportions of sapwood than virgin timber. In some species, such as willow, spruce, true firs, hemlock, and cottonwood, there is little difference in structure and appearance and, therefore, in value between sapwood and heartwood. The darker color of heartwood is generally due to the deposition of certain tannins, gums, resins, or other substances. Heartwood is more durable and generally contains a lower moisture percentage; consequently it is generally more valuable. For spools, handles, and spokes, sapwood is often preferred. Handles for such articles as hammers, axes, shovels, and rakes are preferred from second-growth ash and hickory. Sapwood takes preservative treatment more readily than heartwood—a factor of importance in crossties, poles, posts, piling, and other materials used in a treated condition. See also separate articles on the various species of trees.

Physical Properties.—Strength.—As applied to wood, strength is a general term used in reference to the ability of wood to resist certain stresses and strains. Different woods vary materially in these respects.

The principal resistant features that involve strength are:

(1) Resistance to compression along the fi-

best, as in pillars and dimension timbers in an upright position (exterior frames of buildings).

(2) Stiffness, or the ability to resist bending, as in floor joists and beams supporting heavy loads in all construction.

(3) Strength in tension, or the ability to resist in lengthwise stress. Wood is seldom put to this test.

(4) Shearing strength, or the ability of the fibers to resist rupture either with or across the grain, for example, the shear of a wooden pin in a mortise.

Moisture is an important factor in the strength of wood. Therefore, to a certain extent, strength increases with the degree of seasoning.

Knots or other defects also influence strength. The size, character, and location of the knots are of importance. For example, in cross-bending strength, knots on the upper surface of a beam do not detract from the strength nearly so much as knots on the lower part of the beam.

Weight of the wood is also important. Heavy woods are usually of strong structure. The strongest all-round, commonly used North American woods are longleaf pine, larch, hickory, hard maple, yellow birch, white oak, and black locust. Those of medium strength are cypress, Douglas fir, ash, beech, red oak, chestnut, and sycamore. Some of the weakest woods are white and other soft pines, hemlock, spruce, basswood, yellow poplar, cottonwood, and western fir.

Hardness.—Woods vary a great deal in their hardness, which may be expressed as resistance to indentation or to the saw or ax across grain. Hardness is dependent largely on weight, structure of the wood elements, and degree of seasoning. This feature is important in several methods of utilization, such as flooring, furniture, crossties, handles, and many small wooden articles.

The following table shows the relative hardness of some of the more common species in the seasoned form.

Very hard	Hard	Intermediate	Soft	Very soft
Hickory	Oak	Douglas fir	Ponderosa pine	White pine
Hard maple	Beech	Red gum	Hemlock	Sugar pine
Black locust	Birch	Tamarack	Chestnut	Spruce
Rock elm	Black gum	White elm	Yellow poplar	Redwood
Persimmon	Longleaf pine	Cottonwood	Cypress	Basswood
Osage orange	Ash		Cedar	Willow

Cleavability.—The resistance of wood to cleavage along the grain is important when it is desirable to split timbers. The line of least resistance in cleavage is along the radius because the wood rays are in that direction. Wood splits much more easily when wet because moisture softens the fibers and reduces adhesion across the grain. Straightness in the grain, however, determines to a large degree the ease with which wood splits.

The following table shows the relative splitting qualities of some widely used woods:

Difficult to split	Intermediate	Easy to split
Elm	Birch	Chestnut
Black gum	Maple	All pines
Beech	Hickory	Redwood
Sycamore	Oak	Cedar
Dogwood	Ash	Fir
Red gum	Cottonwood	Western larch

On the whole, most North American woods are comparatively easy to split.

Flexibility and Toughness.—Hickory and ash are examples of flexible woods; on the other hand, hemlock and pine are brittle. Moisture content influences flexibility to a considerable degree.

U. S. Forest Service

Cross section of a tree. A, cambium layer which forms wood and bark cells; B, inner bark; C, outer bark; D, sapwood; E, heartwood; F, pith; G, wood ray, connecting the various layers from the pith to the bark.

Toughness refers to the combined strength, shock resistance, and pliability of a wood. Good examples of tough woods are elm and hickory, which offer high resistance to both tension and shearing.

Durability.—As applied to wood, durability means the ability to resist decay, or simply the length of life of a certain timber under given con-

ditions. Durability is important in connection with those usages where wood is especially susceptible to decay, such as railroad ties, poles, posts, mine timbers, and piling. Durability may also include the influence of mechanical wear, but this is relatively unimportant except in ties.

The durability of the different species is very often the determining factor in their value for several lines of utilization, especially in the case of timbers used without preservatives in contact with the soil, weather, and water.

Contrary to popular opinion, wood does not naturally decay. All decay in wood is caused by the work of fungi and bacteria which live on the starch and other materials in the wood cells and cause the wood structure to break down, leaving common dry rot, punk, bluing, and rottenness in timbers. The fungi are spread about by minute seedlike bodies, called spores, which are scattered about readily by the wind.

In order to live and propagate, fungi and bacteria must have sufficient heat (most wood decay fungi will grow rapidly only in tempera-

tures of between 60° and 90° F.), as well as moisture and oxygen. Whenever any or all of these conditions are removed, decay is not possible and, therefore, wood will last indefinitely. For example, some old piling that Caesar used in crossing certain rivers of France was found to be in sound condition when exposed 2,000 years later. Irish bog oak, submerged for centuries, remains sound because of the presence of acids in the logs and because air has been absent beneath the soil. Furniture seldom decays because moisture is absent and the wood finish prevents the entrance of fungi. For the same reason, we paint our houses and artificially inject poisonous anti-septic fluids into the wood fibers of ties, posts, and poles. A post rots at the surface of the ground first, because at that point there are the greatest changes of moisture and heat. Sapwood is more susceptible to decay than heartwood because of its greater percentage of moisture and food for fungi and bacteria.

There does not seem to be any direct relation between the physical and mechanical properties of wood and its durability. As an illustration, weight, strength, stiffness, hardness, or toughness do not seem to have any influence on the durability of woods. Some of these properties, however, aid in the prevention of injurious effects of abrasion or mechanical wear. Two of the heaviest North American woods, hickory and hard maple, are not durable, whereas some of the lightest species in weight, such as redwood, white cedar, and catalpa, are very durable. Red cedar, a soft wood, is highly durable; beech, a hard wood, is distinctly perishable.

There is, however, often a definite relation between the color of the heartwood and durability. The darker the heartwood, the more durable is the wood, especially in ebony, lignum vitae, catalpa, red cedar, black locust, osage orange, and others. Many species with light-colored heartwood, such as basswood, maple, hickory, spruce, and tupelo, are very perishable.

The durability of any species depends, therefore, on certain chemical constituents, such as resins, gums, tannin, and other decay-resisting materials. These happen to give a dark discoloration to the heartwood of several species; and this phenomenon explains the relation of color to durability.

The following table shows the relative durability of some of the more common species:

Very durable	Durable	Intermediate	Perishable	Very perishable
Black locust	White oak	White pine	White elm	Black gum
Eastern red cedar	Black ash	Norway pine	Beech	Basswood
Live oak	Cherry	Shortleaf pine	Hickory	Buckeye
Black walnut	Red elm	Red oak	Hard maple	Paper birch
Cypress	Persimmon	Red ash	Red gum	Aspen
Western red cedar	Longleaf pine	Yellow poplar	White ash	Willow
Redwood	Western larch	Butternut	Loblolly pine	Sycamore
White cedar	Eastern larch	Sugar pine	Hemlock	Lodgepole pine
Lawson cypress	Slash pine		Spruce	Balsam fir
	Ironwood		Yellow birch	Jack pine

Color.—Color is often a means of identification. As explained earlier, heartwood is generally much darker in color than sapwood. In some species, there is very little differentiation in color between the heartwood and sapwood. This is true especially of spruces, aspens, cottonwoods, and balsam. In some species, the borderline between sapwood and heartwood follows the line of growth rings but in maple and hickory this is not so. The color contrast between sapwood and heartwood

is very pronounced in some species, such as redwood, black walnut, black cherry, and black locust. Second-growth trees and the upper portions of the trunks of all species have a much larger portion devoted to sapwood than do virgin timber trees or butt logs. White maple furniture is derived from the sapwood of the sugar maple. Baseball bats and many forms of tool and implement handles are cut from ash sapwood. Some species, such as maple, white ash, and hickory, have wide sapwood, whereas narrow, whitish sapwood is characteristic of other species, such as black ash, black locust, western red cedar, redwood, and western larch.

All freshly sawed woods are much lighter in color than when exposed to the air or sunshine for some time. Oxidation turns all woods to darker shades. Newly sawn cherry heartwood is pinkish in appearance but the wood turns a deep dark cherry red when exposed to the light. This is also true of mahogany and other dark-colored species. Black walnut turns to a deep dark brown appearance after sawing. The heartwood of yellow poplar turns a rich yellowish green which the English call canary wood. The lustrous dark colors of mahogany, purplewood, teak, and many other tropical woods with their attractive figure and grain contribute much to their wide demand and high values.

Luster.—This is the quality of wood and its component parts which reflect light and give it an attractive sheen. All woods are lustrous or dull under varying light conditions. The method of sawing lumber may contribute to this quality. For example, quartersawed lumber with the cut across the wood rays appears to be more lustrous than plain-sawed boards because these rays reflect the light. This is strikingly true of quartersawed oak, beech, red gum, sycamore, and other woods with large, wide rays. Spruce and catalpa are examples of lustrous woods. Red cypress is typical of a dull-appearing wood. All woods become lustrous, to a degree, by polishing. However, some, such as mahogany, cherry, black walnut, satinwood, and teak, due to gums, resins, tannin, and oils in their heartwood and to their attractive grain, present an especially lustrous appearance.

Odor and Taste.—Anyone visiting a sawmill is familiar with the prevalent odors. Altogether they are very pleasant, especially when resinous species like pine and spruce or oaks with their

tannin content are being sawed. All freshly cut or sawed wood yields an odor which in some case is distinctive and may be used as a source of identification. Sometimes odors may be traced to decay or partial decay. Cedars have a very distinctive aromatic odor which occurs in both the leaves and wood. Incense cedar of California is well named. Sassafras can be readily identified from its odor. So can camphorwood from the Far East. Some woods may be identified from their

these as well as odor, but this property is not easily recognized or described. Many woods do not have any characteristic odor or taste.

Weight.—Woods vary greatly in weight from the very heavy tropical *lignum vitae* and *quebracho* to the extremely light balsa wood. All native woods of the United States and Canada have a weight, expressed in specific gravity, of less than one when bone dry (wood is said to be bone dry when it ceases to lose weight after drying in an oven at 100° C.). Thus all these woods will float when dry.

Most hardwoods are heavy, especially oak, black walnut, beech, birch, maple, ash, hickory, osage orange, and black locust. Cedars are among the very lightweight woods. Others of low specific gravity are the firs (*Abies*), hemlocks, spruces, eastern white pine, Idaho white pine, redwood, and ponderosa pine. The two most commonly used lumber species, Douglas fir and southern pine (including longleaf, shortleaf, loblolly, and slash pines) occupy intermediate positions as to weight. Weight is also, generally, a reflection of hardness and strength as well as of fuel value. Hickory is an outstanding example of a hard and heavy wood possessing excellent strength qualities. It is also rated as a top-ranking fuel wood because of its weight.

All freshly cut wood contains much excess weight in the form of water within its cells and intercellular structure; removal of the bulk of this excess weight is one of the main objectives of the drying processes (see section 3. *Seasoning*).

Chemical Properties.—Most of the chemical studies and research in wood have been devoted to cellulose and lignin (qq.v.). Cellulose, an inert substance, is the chief component of the solid part of woody plants and is the great source of the modern paper and paper products manufacturing industry. Lignin is a substance or mixture of substances which, with cellulose, forms the essential part of woody tissue.

Wood is composed of about 88 percent cellulose and lignin in approximately equal amounts, depending upon the species. Of the balance of its constituents, the principal ones are tannin, resins, and gums. Cellulose is colorless and insoluble in ordinary liquids, such as water, alcohol, and benzene, as well as in dilute acids and alkalis. The framework of the cell walls of woods is very largely composed of cellulose.

Lignin is likewise insoluble in common solvents, but somewhat soluble in dilute alkalis. It forms the cementing agent which binds the cells together. It is mixed with cellulose in the cell walls. Lignin may be dissolved with some reagents; thus the wood cells may be separated as accomplished in chemical papermaking processes. Both cellulose and lignin contribute many special qualities to wood, such as its hygroscopicity (ability to absorb and retain moisture), its resistance to corrosion by salt water and dilute acids, and, very importantly in its commercial applications, its susceptibility to decay. The last-named feature explains why paper turns brownish so readily on exposure to the sun and the fact that it does not last very long. This is notably true of newsprint.

3. Seasoning

Methods.—The water contained in freshly cut wood constitutes from one third to more than two thirds of its weight. The removal of much of this moisture is accomplished by seasoning, also known as conditioning or curing.

Seasoning, or the drying of wood, is done in one of the following ways:

(1) **Air drying, or the natural process of seasoning** by exposing properly piled wood to air. This method was formerly the only one used and is still employed to a large extent in many small sawmill operations.

(2) **Kiln drying, or the artificial method** by which the process is hastened and intensified by means of heat, humidity, and circulation of air. Use of kiln drying has sharply expanded, particularly in the United States and Canada, partly as a result of great improvements in methods.

(3) A combination of air and kiln drying. In some large mills, lumber is first air-dried until it contains from 14 to 30 percent of moisture and then finished to the desired condition in dry kilns. Some of the largest mills kiln-dry all their lumber.

Thoroughly air-seasoned lumber, dried to between 12 and 18 percent moisture content, is suitable for certain uses, such as sheathing, roof boards, subflooring, boxes and crating, and fencing; also for posts, poles, ties, tank stock, and blanks to be bent, as for hockey sticks, skis, and tennis rackets. However, hardwoods and shop

U.S. Forest Service, Forest Products Laboratory

Diagram shows how seven pieces of wood taken from various parts of a tree may be expected to shrink as they dry. Tangential shrinkage is greater than radial shrinkage.

lumber to be remanufactured into cabinetwork, furniture, flooring, handles, heel stock, and many other articles must be dried still lower by means of the dry kiln. All lumber requires at least partial seasoning for most purposes; generally, moisture reduction to not more than 120 percent of the oven-dry or bone-dry weight of the wood is required before it can be considered suitable for use. Some exceptions to this principle are piles of structures to be used under water, certain types of posts, and temporary mining timbers.

Objects.—The principal objects sought in air seasoning wood are as follows:

(1) The weight of lumber is reduced by 25 to 33 percent of green weight, lowering the cost of shipping. Dry lumber is handled more easily and cheaply.

(2) Since all wood shrinks with drying, it is essential, for nearly all uses, that lumber, before being remanufactured, be brought to the equilibrium moisture content of the factory in which it is to be used.

(3) Thoroughly dry wood cannot rot as no fungus can grow in it, and as long as it remains dry no rot will occur. Consequently, thorough

is a pe... usually... k; therefore quick drying in hot, moist climates is important.

(4) Seasoning greatly increases hardness, and stiffness, provided that the is not injured by undue checking or honeycom. Green wood is soft and weak in comparison with dry wood.

Kiln drying, when properly done, increases the length to the same degree as air drying. In other words, properly kiln-dried lumber is equal to the best air-dried material in every respect.

Lumber shrinks during the seasoning process and therefore it may be degraded by checks, shakes, or other defects due to this process; consequently buyers prefer to purchase lumber that has been graded and inspected after seasoning.

Timbers that are to be subjected to treatment with a preservative, such as creosote, must nearly always be at least partially seasoned; otherwise the preservative will not enter the wood properly. Timber used for bridge construction, crossties, poles, piling, mill construction, block paving, and similar purposes may be more economically and successfully treated if it is first thoroughly seasoned. Sometimes rapid surface drying is accomplished in hot oil during the treatment, but results are better if the timber has been previously dried.

The time required to air-dry varies with the climate, the season in which the lumber is piled, and the manner in which it is piled. The time required to kiln-dry varies with the drying system used, the use to which the lumber is to be put afterward, and the quality (grade) of lumber.

By and large, hardwoods take longer to season than softwoods. For instance, birch, beech, maple, and cherry, among hardwoods, may be air-dried from the green state to 20 percent of original moisture content in 150 to 200 days; they may be kiln-dried from the green state to 6 percent moisture in 10 to 15 days. By contrast, Douglas fir, among softwoods, may be similarly air-dried in 40 to 70 days, and kiln-dried in 4 to 8 days.

4. Lumber and Related Products

Despite the great diversification of wood uses consequent on the advance of wood chemistry, lumber and related products in all their multifarious forms still comprise by far the largest wood use category, accounting for about three quarters of the volume of all wood consumed. The balance is made up, in about equal quantities, of fuelwood and pulpwood.

The following is a discussion of some of the most important related products.

Veneer and Plywood.—Since Roman times, thin slices of wood known as veneer have been cut from logs and used for ornamental and other purposes. In modern times, the volume of plywood manufactured has shown the greatest advance of any product in the lumber industry. In the making of plywood, 3, 5, 7, or more veneer slices are laid, one upon the other, with the grain of each at right angles to those of the sheets above and below it, and are bonded together with glue or synthetic resins. The wood chiefly used is Douglas fir, which has proved to be ideal for the manufacture of rotary cut veneer because of its large, symmetrical sizes, relatively clear wood, and comparatively low cost. Other woods used are ponderosa pine, southern pine, red gum, oak, tupelo, ash, yellow poplar, and elm. Most of the

U.S. Forest Service, Forest Products Laboratory

Wooden posts are slid into a pressure cylinder in which they are to be impregnated with preservative chemicals.

volume is in thicknesses ranging from 3-ply (totaling $\frac{3}{8}$ -inch thickness) to 5-ply ($\frac{3}{4}$ inch).

Plywood is used for many forms of construction, including sheathing, interior finish, sub-flooring, underroofing, paneling, flooring, concrete forms, cabinets, furniture, shelving, partitions, and ceilings. A large volume goes into containers, such as baskets, boxes, crates, trunks, chests, hampers; into boats, toys, tables, woodenware, and for repair work in attics, garages, and basements. Large volumes are used in some forms of prefabricated dwellings.

Rotary cutting of veneer. A thin, continuous sheet is produced by rotating the log against a stationary blade.

U.S. Forest Service, Forest Products Laboratory

The development of moisture- and heat-resistant adhesives has greatly advanced the demand for plywood, and for its counterpart, laminated wood. In the latter, the layers of wood, either veneers or boards, are laid together with the grain of all the layers running in the same direction, thereby providing a product of great longitudinal strength. Plywood and laminated wood are widely used in boats. Improved adhesives have also contributed to the use of laminated members for heavy truss construction, to the gluing together of narrow boards to make wider ones, and to the making of finger joints by which short lengths are joined to make longer pieces. This has materially assisted in expanding the use of otherwise waste materials.

Crossties.—In modern times, the most significant development in the field of crossties—one of the greatest of all wood consumption categories—has been the use of preservatives, thereby greatly extending their length of service. (An oak tie treated with creosote lasts 25 years, whereas the average untreated tie lasts only 5 years.) By greatly reducing the number of crossties needed, preservatives have become an important factor in the conservation of North American forests. Formerly, most crossties were hand hewed. Today the majority are sawed, the principal species used being oak, followed by southern pine, Douglas fir, and gum, in that order. With expanded traffic volumes and heavier rolling stock, the tendency has been to install larger ties, some railroads using sizes ranging from 6 by 7 inches to 7 by 9 inches in 8½- and 9-foot lengths.

Poles, Piling, and Posts.—Millions of relatively small, round, straight, durable trees are used annually for these important products. In the case of poles for telegraph, telephone, electric light, and power transmission lines, the most commonly used size is 35 feet long with a 7-inch-diameter top. However poles may be from 20 feet up to 100 feet long or longer. Most are treated with preservatives. Southern pine supplies more than two thirds the total number, followed by western red cedar, Douglas fir, lodgepole pine, larch, northern white cedar, ponderosa pine, and many others.

Great quantities of piling are used in all seaboard, river, and lake communities for wharves, docks, piers, holding booms, flood dams, and abutments; as well as for railroad and bridge trestlework, grade crossing eliminations, and similar purposes. In locations without rock foundations, piling is often used, as in Chicago, to support large buildings. Most strong, dense, and hard species are used, often in untreated condition if no part is exposed to changing moisture and temperature conditions. Oak, Douglas fir, southern pine, elm, hard maple, and cypress are in wide use for piling.

Posts, used by the millions on farms and ranches, by railroads, and along highways, are produced largely from farm woodlands. They are generally cut in 7-foot lengths, but some are 20 feet long. Only part are treated, although, due to improved preservation methods, the tendency is to increase preservative treatment. In the western part of the United States, redwood and western red cedar, both very durable, are the woods most widely used; northern white cedar is used in the Great Lakes states and Northeast, while cypress and treated southern pine are in wide use in the South. Where available, locust, catalpa, hackberry, white oak, mulberry, and eastern red

cedar woods are also used to make posts.

Mine Timbers.—Specifications of length and size of mine timbers vary widely. Many mines use round timbers from local forests. Coal mines use wood principally for props or legs and caps. The generally warm and humid temperatures render conditions favorable to decay; therefore, much timber is treated. Untreated timbers are used only in temporary shafts and tunnels. Hardwoods (oak, ash, maple, locust, and gum) comprise about 80 percent of all timbers used in the mines of the United States and Canada, the balance being supplied by softwoods, such as southern pine, Douglas fir, western larch, and ponderosa pine.

Wood Containers.—This is a broad category including tight and slack cooperage—the former used for liquids and the latter for a vast variety of barrels for flour, sugar, chemicals, powdered milk, and other products. It also includes boxes and crating materials from wood, used in shipping citrus fruits, canned goods, vegetables, milk, fish, apples, and many other products. Normally about 15 percent of all lumber cut is used for these purposes.

Miscellaneous.—Other important wood products include excelsior from soft, lightweight woods, especially basswood, cottonwood, and aspen; also hardwood dimension, which consists of small pieces of red gum, yellow poplar, oak, maple, tupelo, walnut, and other species, used principally for furniture, toys, tools, and numerous other items. Handle and implement stock are produced in important quantities from hard tough-textured woods, such as ash, hickory, and hard maple. Millions of fork, rake, hoe, spade, and shovel handles made of ash are used yearly.

In the realm of waste lumber utilization, an important and relatively new product is the compressed-fuel briquette made of wood shavings and other mill refuse. These briquettes, also known as "presto logs," are about 4 inches in diameter by 12¾ inches long, and are widely used in railroad diner kitchens, army field kitchens, automobile trailers, and ocean-going vessels.

See also LUMBER INDUSTRY.

5. Wood Chemistry

The field of chemicals and chemical products derived from wood has grown rapidly in importance. Some of the industries that have emerged, such as paper and pulp and their diversified products, are of major size and significance.

Wood consists of a skeleton of cellulose and, in addition, varying amounts of lignin, tannin, resins, gums, and other materials. Cellulose is readily converted into sugars. Lignin, next to cellulose, is the most abundant and widely distributed of the organic substances; it is the substance that cements together the wood cells and reinforces the cellulose within the cells. In pulp processes, lignin must be removed before white paper, rayon, Cellophane, or many of the other cellulose products can be successfully manufactured.

Since the first serious study of the chemistry of wood by the French chemist Anselme Payen (1795–1871), many scientists have contributed to our knowledge of this complex subject. Outstanding among them are the English chemists, Charles Frederick Cross (1855–1935) and Edward J. Bevan (d. 1921), whose fundamental work on cellulose laid the basis for the viscose rayon process, and the Swedish chemist, Johan

Peter Klason (1848-1937), known as the "father of lignin chemistry."

The growing realization of the great potentialities of wood as a chemical raw material for industry stimulated fundamental and technical research in many parts of the world, particularly in Scandinavia, Germany, Canada, and the United States. As a result, industry, academic institutions, and government agencies developed wood chemistry research laboratories, such as the United States Forest Products Laboratory at Madison, Wis.; the New York State College of Forestry at Syracuse, N.Y. (later known as the College of Forestry at Syracuse University); the Pulp and Paper Research Institute at Montreal, Canada; the Institute of Paper Chemistry, affiliated with Lawrence College, at Appleton, Wis.; and the Swedish Forest Products Laboratory at Stockholm. Contributions from workers at these and many other institutions and in industry have become evident in the many new developments in processes for making rayon, films, lacquers, plastics, pulp, paper, fiberboards, and other chemically produced forest products.

World War II stimulated developments in wood chemistry as in other fields of science and technology. In Europe these were mainly in the direction of foodstuffs and industrial chemicals, such as sugars, alcohol, cattle fodder, yeast, tall oil products, butanol, glycol, and other organic chemicals. Developments along these lines also took place in the United States, such as the United States Forest Products Laboratory method of wood hydrolysis. In addition, new important structural and plastic products have emerged. These include the newer paper-base laminates, lignin-paper laminates, dimensionally stable chemically modified wood, and the combination of synthetic resins with paper, veneer, and wood to make many types of light, strong, structural forms for aircraft, boats, and buildings.

The growing realization in the lumber and other forest industries of the need for a better-integrated utilization of their raw wood material has led to greater utilization of wood waste. In the United States, this has been particularly apparent on the West coast in both the Douglas fir-hemlock areas and in the redwood region. This, with its promise of better forest management and timber use, has been one of the most significant trends in wood chemistry.

6. Wood Chemistry Products

Wood Pulp and Products.—Wood is the source of the bulk of the world's paper. In the United States, about 90 percent of all paper is made wholly or largely of wood. Although there are hundreds of pulp and paper mills scattered throughout the country, the principal states of production are New York, Maine, Wisconsin, and Washington. Canada, source of four fifths of all newsprint used in the United States, also has a vast pulp and paper industry, concentrated chiefly in Quebec, Ontario, and British Columbia. Spruce has been the traditional wood used because of its long, strong fibers and its availability. But southern pine has advanced rapidly and now supplies more than half of all the wood used for papermaking in the United States. Other principal woods used are hemlock, aspen, chestnut, yellow poplar, and gum. Many mills are now using sawmill waste, such as slabs, edgings, trimmings, and chips.

The principal chemical methods of making

paper out of wood pulp are known as the sulphate, soda, and sulphite processes, of which the first two are alkaline processes and the last-named an acid process. In all three cases, wood chips are "cooked" in chemical liquors to produce the pulp that goes into the papermaking machines. In addition to these methods, wood is converted into pulp for making paper and other products by mechanical means. See also **CHEMICAL INDUSTRIES—Pulp and Paper**; **PAPER**.

State University of New York, College of Forestry

Hemlock wood fibers, greatly magnified. They are chemically bleached for use in white paper.

Rayon.—Rayon, or artificial silk, has expanded enormously since the first mill produced it in France in 1899. In 1892, with the development of the viscose process, the foundation was laid for the gigantic rayon industry of modern times. The raw material for making rayon by the viscose process is cellulose obtained from western hemlock, spruce, and southern pine, as well as cotton linters. It is the source of approximately nine tenths of all rayon produced. Wood pulp is also a major source of rayon made by the cellulose acetate process. See also **TEXTILES, SYNTHETIC—Rayon**.

Plastics.—As applied to wood products, plastics include cellulose derivative plastics, lignin plastics, pulp-molded products, and wood particles welded by a synthetic resin matrix. The first named is the most important. Sawdust, wood flour, lignin from waste pulping liquors, and other sawmill wood wastes have received wide attention as bases for making plastics. See also **PLASTICS**.

Naval Stores.—These comprise rosin and turpentine obtained from the resinous gum of longleaf and slash pines. In the United States, the industry, dating back to colonial times, is now centered in southern Georgia and northern Florida. Trees are tapped weekly during the growing season for a resinous exudation or gum which flows into tin cups. This is distilled for turpentine, the residue being screened for rosin. Both products have an important place in industry. See also **CHEMICAL INDUSTRIES—Turpentine and Rosin**; **NAVAL STORES**.

Hardwood Distillates.—These are derived through the heating of wood for carbonization to

make charcoal and for the recovery of vapors to make wood alcohol and acetate of lime. The woods chiefly used have been hardwoods such as beech, birch, oak, and maple. Through chemistry, however, synthetic products have replaced wood alcohol and acetate of lime, while the use of charcoal has decreased; therefore many plants have gone out of existence. See also **CHEMICAL INDUSTRIES**.

Softwood Distillates.—These products are an outgrowth of hardwood distillation and, in the United States, the industry is found only in the South. The most successful method used is the chipping of old pine stumps and their distillation to recover rosin, turpentine, and pine oil.

Extractives.—Wood, as well as bark and leaves of many species, both foreign and domestic, serves as the source of many tannins, dyes, medicinal preparations, volatile oils, and similar products. Indians were found using oak bark to preserve buffalo hides. Hemlock bark tanneries were important in the early development of the United States. The tannin was extracted from chestnut wood. Quebracho is now the chief source of tannin.

Formerly many dyes were produced from various tropical woods as well as from the osage orange, while quercitron was obtained from black oak and other species. Fustic and logwood are important foreign sources. Aniline dyes have replaced many of the wood dyes.

Among the extractives are storax from sweet gum; volatile oils from sassafras, sweet birch, and red cedar; Canada balsam from fir; mucic acid from western larch; and cascara from the cascara tree of Oregon. See also **DYES AND DYEING**; **TANNINS**.

Densified Wood.—At first, this product was known as improved wood; later it became more commonly known as densified or modified wood. The process of making densified wood consists of filling or closing the voids in the cellular wood structure, accompanied by compression under heat. This process adds hardness, increased strength, greater durability, and dimensional stability. In some forms, however, the process reduces toughness, and in all cases it makes the wood much heavier. Compression of wood fibers is generally accompanied by impregnation with phenolic resins and urea resins. By some methods, compression of wood is done without impregnation. Impregnation with phenolic resins is usually done in veneer sheets, $\frac{1}{8}$ inch thick and laid one upon the other with parallel grain direction before pressing. Impregnating thick, solid wood is a very slow process. Variable density may be secured by tapering down the length of alternate layers and pressing to a uniform thickness. In other cases, impregnated veneer layers may be placed outside an assembly when surface hardness and light weight are required; or they may be placed where a readily glueable surface is essential. Commercial products of the resin-impregnated type are variously known as Compreg, Pregwood, Pluswood, and, when pressures do not exceed 200 to 500 pounds per square inch, the product is known as Impreg. In England it is known as Jicwood. Due to their strength and hardness, some densified woods have replaced metals as material for gears and die castings, and for many other items. When various types of paper layers are used instead of layers of wood veneers, the final product is known under technical and trade names, such as Papreg, Consoweld,

Formica, Micarta, and Panelyte. Some densified-wood products have found useful outlets in several branches of the furniture industry. Although an entire piece of furniture may not be made from densified wood, certain parts, such as table tops, legs, and exposed portions subject to severe usage and wear, are made from them. A market has been developed for shuttles, golfheads, flooring, and highly specialized uses where a heavy, dense, hard, and durable surface is required.

WOOD ALCOHOL or **METHYL ALCOHOL** or **METHANOL** (also called **CARBINOL**), an important industrial chemical belonging to the class of organic compounds called alcohols and having the formula CH_3OH . It is a colorless liquid boiling at $64.5\text{--}64.7^\circ\text{C}$. and freezing at -97.5°C ., miscible with water and most organic liquids, flammable, and highly poisonous when taken internally.

The name wood alcohol derives from the method formerly used to make this substance, described by Robert Boyle in his *Sceptical Chymist* in 1661. The method involves the destructive distillation of hardwoods, heated in the absence of air to above 250°C . Charcoal and a gas which condenses to pyroligneous acid are produced. This acid separates into a dark-colored, heavy oil and a lighter aqueous layer from which wood alcohol, acetic acid, acetone, and other chemicals are obtained. Since the 1930's wood alcohol has been made by the reduction of carbon monoxide or dioxide with hydrogen in the presence of a metallic-oxide catalyst, at 350° to 400°C . and at pressures of 3,000 pounds per square inch or over. It is also made by partial oxidation of hydrocarbons from natural gas.

Wood alcohol is the raw material for the manufacture of formaldehyde and an intermediate in the synthesis of other industrial organic chemicals. It is used in antifreeze mixtures; as a component in special fuels; as a general solvent in making such products as paint removers, surface coatings, dyes, and adhesives; and as a denaturant for ethyl or grain alcohol, since it cannot be made nonpoisonous.

WOOD ANEMONE, the name of *Anemone nemorosa* of Europe and eastern Asia, and of the closely related *A. quinquefolia* of North America, also called the windflower. *A. nemorosa* has a horizontal rhizome; the aerial stem is 3 to 9 inches tall, and terminates in a single flower opening in early spring. The basal leaves, which appear later, are 3- to 5-parted, and toothed;

the 3 leaves subtending the flower are similar, but somewhat smaller. The flower, an inch or more across, is white to purplish, with 6 to 9 perianth parts, numerous stamens, and 10 to 20 pistils. *A. nemorosa* is cultivated, and some forms occur with larger flowers, double flowers, and rose to purple perianths. *A. quinquefolia* differs in its more delicate habit, slenderer rhizomes and leaf stalks, and slightly smaller flowers. It is an attractive woodland plant of early spring, widely distributed in North America. It also exists in several forms, and has sometimes been considered a variety of *A. nemorosa*. The European and Asiatic forms of *A. nemorosa*, and those of the American *A. quinquefolia*, illustrate the diversity achieved by a presumably single ancestral species which has become widely distributed over periods of time.

WOOD BUFFALO NATIONAL PARK, Canada, a large unfenced wildlife sanctuary and wilderness area located in northeastern Alberta and southern District of Mackenzie, Northwest Territories. Its 17,300 square miles contain forests, plains, and many streams and lakes, including Lake Claire, which is 40 miles long and 28 miles wide. It is crossed by the Peace River, and its eastern boundary consists of the Athabasca River to the south and, in part, of the Slave River to the north, all of these streams being famous in the history of Canada's early exploration and the fur trade. Administered by the Canadian Department of Northern Affairs and National Resources, the park was established in 1922 to protect the only remaining herd of wood bison, *Bison bison athabasca*. Some plains bison (*B. bison bison*) were added from 1925 to 1928. The herd was estimated to number as many as 15,000 individuals in 1962. The park also contains the only known nesting grounds of the nearly extinct whooping crane. See also BISON—American; CRANE.

WOOD CARVING (also written WOODCARVING), the process and product of shaping wood into decorative and sculptural forms. The latter is also called *wood sculpture*.

Many qualities of the dried trunks of trees have recommended them for various uses since the early beginnings of the crafts. Wood is a widely prevalent and self-restoring source of supply, available in sizes suitable for small objects as well as buildings. Strong enough to support great weight and to span considerable areas, it is not too heavy to be handled by an economical amount of manpower nor too resistant to be worked readily and accurately with simple hand tools. Wood has a pleasing range of natural color, tonal depth (due to the annular structure or grain), and receptivity to a number of sensuously satisfactory surfacing treatments. See also WOOD.

Three general conditions have contributed to the growth of wood carving in different historical periods:

(1) In primitive and ancient societies wood was often used because of its prime availability and ease of working.

(2) In rich and highly developed societies wood carving has remained an important decora-

tive medium, extensively used in building.

(3) Predominantly aesthetic and individualistic interests of modern art in the West have brought about a small revival of wood sculpture because of its unique qualities as material and the directness of the carving process.

Although these categories are not mutually exclusive, they afford a useful basis for dividing the subject.

Primitive and Ancient Cultures.—Because vast forests of large trees occur on the moist, temperate Pacific coast of North America, the economy of the American Indians residing in that area was based extensively on wood. The anthropologist Franz Boas has described a tribe which used wood even for the sails of its boats, regulating the strokes of the adze by which the sails were shaped so that the surface acquired a simple but distinctive rhythmic pattern. The socially and religiously important totem poles prevalent throughout this area are well known, and wood carvings of similar import were used to decorate family and tribal buildings.

African Negro culture and that of the Pacific islands have produced an art of wood carving which embodies great expressive and decorative ingenuity, and which has become an important influence on sophisticated western European expression as well as a prized field for collectors. Much of the work has a fetishistic religious function, especially in connection with ancestral and funerary rites. Decorative carving is applied to furniture and buildings, and in the South Seas also to boats. Both cultures use wood extensively for the carving of ceremonial masks. An important aspect of this work is the profound ingenuity of the artists in applying traditional modifications to human and animal shapes, reducing parts to their simplest geometrical denominator and arbitrarily modifying natural proportions. See also MASK.

Wood was used for many important works during the early dynasties in Egypt. Figures of servants and others intended to provide sustenance and activity for the deceased ruler in the life after death were often made of wood in the Old Kingdom (2664–2155 B.C.), as were ceremonial figures of the ruler himself. Wood was even used for the portrait statue enclosed in every Egyptian tomb as a resting place for the soul (ka). See also EGYPTIAN ARTS.

The absence of wood in ancient remains, especially in moist climates, may often be due to its perishability. This is doubtless true of remains from the Eurasian nomads, especially in northern regions, and in the case of early Greek sculpture. There is ample evidence that the Greek temple evolved from a wood and brick structure, and early records refer to highly venerated statues called xoana which seem to have been merely logs with a rough indication of a head at one end and with actual textiles for clothing. These very possibly may have evolved into some form of wood carving, for the earliest archaic Greek figures have a quality that suggests the structural refinements of wood, as in early Egyptian wood figures; but if such works existed they have now entirely disappeared.

Architectural Decoration.—By far the most elaborate and prolific production of wood carving has occurred in societies which developed wealth and skill, yet for some reason did not supplant wood entirely with metal and stone (generally considered more monumental and

elegant materials). This would be either because wood was so prevalent that it had an overpowering economic advantage, as in medieval western Europe when much of the land had not yet been cleared of primeval forests, or because its ready workability was still important during early stages of technical development, as in North Africa and the Far East. Before the age of mechanical woodworking tools like the circular saw and the planer, it was virtually as laborious to smooth the surface of a beam or panel as it.

The Metropolitan Museum of Art

A 16th century Flemish Deposition group, carved in oak in high relief, possibly at Antwerp.

Medieval Europe.—Although monumental architecture throughout Europe (except in the Baltic region) has always been predominantly of stone or brick, much of the decoration was accomplished by wood carving. Wood used for church furnishings in the Middle Ages, such as choir stalls, lecterns, rails, rood screens, and the like, was elaborated with surface carving to match the rich sculpture and decoration in stone on the outside of the building. Finely shaped wood was used also for ceilings and other interior features, such as wall paneling, in the more elegant domestic architecture of the period.

Wood carving was carried to its highest development in Europe by the High Gothic art of southern Germany early in the 16th century. Great skill was concentrated in the elaborate retables and in altarpieces consisting of a large central scene of figures, carved in full round, and wings depicting related subjects. These wings were carved in relief, front and back, and were hinged at the sides of the central panel so that the sculptural decoration would be visible when closed as well as open. One of the greatest of these was the altarpiece (*Assumption of the Virgin*) in the small church of Creglingen, Fran-

conia, Germany, by the outstanding wood-carver of all Western tradition, Tilman Riemenschneider (q.v., 1460?-1531).

Innumerable small religious carvings in wood, often polychromed, also were made for domestic use at this time, and carving of various degrees of elaboration was applied to the walls and furnishings of civic and domestic buildings. A peculiar motive derived from an important article of trade was the linen fold, used for flat areas on furniture or on the repeated sections of wall paneling.

Italian Renaissance forms of cultural expression, adopted generally by the aristocracy of Europe in the period when modern nations were forming, replaced wood with marble and bronze as the important sculptural mediums, and painting became widely used on the walls. As the distinction between "artist" and "craftsman" grew with the constant demand for stylistic invention in major works of art, wood sculpture almost ceased to be produced, and decorative

The Metropolitan Museum of Art

Detail of woodwork in a 17th century English staircase.

carving was reduced to a minor mechanical craft that can best be studied in terms of the historical styles of interior decoration such as Jacobean, Georgian, Chippendale, Biedermeier, and so on (see FURNITURE).

There were two notable survivals of the tradition, however. England produced an important wood-carver after the adoption of Renaissance style. Grinling Gibbons (q.v., 1648-1720) decorated the interiors of many of the churches designed by Sir Christopher Wren, as well as important aristocratic mansions. Although technically his work could not have been produced without the antecedent Gothic development of the craft, his style is that of the Renaissance in its classically detailed architectural columns and entablatures, and in the highly naturalistic garlands of fruit and foliage in full relief, reminiscent of the terra-cotta frames made by the della

Robbia family in the 15th century Florence.

A less monumental but longer-lived survival is seen in the folk art of the villages, principally in central Europe, where the craft of carving chests, clock cases, and other furniture, as well as small religious and genre figures, has been handed on with little change from generation to generation. A special type of design known as chip carving appears widely in this type of work. The "chip" is a small isosceles triangle, deepest at the apex, that is dug out of the wood with the point of a knife. An elaborate geometrical pattern is built up by removal of innumerable adjacent chips.

North Africa and the Far East.—The subjection of a numerous working population through the caste systems of the great Asiatic cultures encouraged the development of subtle and exacting procedures in the crafts and made available vast quantities of labor for the elaboration of the product. Wood was used extensively in building, sculpture, and household furnishings (although other mediums were likewise prevalent), and the characteristic design was a rich over-all coverage of the surface with fine though often repetitious detail.

Wood was used for religious and theatrical masks in Japan, and ancient examples made for the *no* (Japanese *nō*) drama have been handed down to the present in the families of the actors (see *DRAMA—Japanese Drama*). Japanese domestic interiors are quite simple in general, but a

carved ventilating panel called a *ramma* is a characteristic feature. Special locations like the family shrine (*butsu-dan*) and a niche for highly prized objects of art (*tokonoma*) are also decorated with fine carving. Chinese interiors tend to employ much more carving, including rich elaboration of ceiling beams and columns. Religious shrines in both countries have been extensively decorated with wood carving in various periods, and in Japan quite monumental buildings have been constructed entirely of wood.

Similarly rich and extensive uses of carved decoration in wood are characteristic of Mohammedan art in North Africa. The Muslim prohibition against representation of human and animal figures stimulated the development of elaborate geometrical patterns, often with simple repetitious phrases in Kufic lettering (see *KUFIC* or *CURIC WRITING*), worked as a border or focus of the design.

Modern Revival.—Demands for constant novelty in 20th century art of the Western world have caused a number of sculptors to explore new or unused technical means. The use of wood has been revived for its ingratiating sensuous qualities of color, finish, and texture. Its workability also serves the competitive, individualistic situation of the modern sculptor, enabling him to move directly toward the final result with no intermediate processes like the casting of metals or the firing of clay. Thus he is relieved of costly investment of labor or funds (beyond the capacity of many individuals in an uncertain market), and he has the progress of his conception under direct control and in constant prospect.

Northern countries, perhaps because of their strong Gothic heritage, seem to have produced the most notable wood-carvers. Carl Milles (1875–1955), a Swedish sculptor who executed many commissions in the United States and who was director of the Cranbrook Academy of Art in Bloomfield Hills, Mich., used wood for the large, somewhat stylized mural (*Man and Nature*) in the lobby of the General Dynamics Building, Rockefeller Center, New York. The German sculptor Ernst Barlach (1870–1938) practiced wood carving to a greater extent than any other well-known modern artist. His genre figures, carved in broadly simplified but naturalistic masses, suggest the genre phase of Gothic tradition.

England's most noted contemporary, Henry Moore (1898–), has occasionally used wood. Constantin Brancusi (1876–1957), the Rumanian sculptor who worked in Paris, has been the chief exploiter of the sensuous qualities of wood in abstract aesthetic forms which follow the cubist development in painting.

The American Tradition.—Wood played a great part in the early economy of the North American colonies, a fact reflected by the growth of wood carving according to all the aforementioned motivations for its use. Pioneering farmers carved weather vanes and other figures in untutored primitive style, probably for recreation in periods of inactivity such as snowbound winters. Utensils like cake and butter molds were carved with decorative patterns in wood. Eighteenth century prosperity brought extensive building, largely in wood decorated by Georgian classical motifs. A noted carver of this type of decoration was Samuel McIntire (q.v., 1757–1811), who built and decorated a number of elegant houses in Salem, Mass., and also carved

The contemporary American sculptor, Chaim Gross, at work on his *Ballerina* in 1940. The 31-inch figure was carved out of a solid block of hard Imbuia wood.

furniture and did portrait sculpture in wood.

A considerable industry was involved during much of the 18th and 19th centuries in carving decorations for wooden ships, chiefly figureheads (see FIGUREHEAD) and decorative stern pieces. William Rush (1756-1833) of Philadelphia, who was the first native-born professional sculptor in the United States, carved in wood and made a number of figureheads. Many pictorial shop signs were carved in wood, a type of which, the cigar store Indian, remained in use until the early decades of the 20th century. During the period of western expansion, carving as a pastime developed a tradition in the Midwest of whittling, in which Carl Schimmel became noted for his small genre groups. A much earlier tradition was that of the primitive religious carvings (known as *bultos*) of the Spanish Southwest.

In the 20th century several artists resorted to wood for the aesthetic subtleties of the material as well as for the directness of the carving process. Chaim Gross (1904-) used wood almost exclusively, and many others, like José de Creeft (1884-) and Isamu Noguchi (1904-), included it in a range of materials for occasional use. Very few of the conservative sculptors have used wood; but a number of gracefully refined figures on a small scale were produced by Allan Clark (1896-1950).

Technique.—Wood can be accurately shaped into complex forms by an amount of effort well within the capacity of the human hand using an edged steel tool. The end of a small, flat bar is ground to an angle of about 60° and then honed on a hard, fine-grained stone to a degree of sharpness that is microscopic. Shavings of wood may be removed by pushing the edge of this tool, called a chisel, against the block, at the same time sliding it laterally. Larger quantities of wood may be removed by driving the opposite (handle) end of the chisel with a mallet. Less efficient techniques were used by wood-carvers before the discovery of steel.

The edge of the tool may be curved in various arcs, in which case it is called a gouge. The edge may make a 60° or 90° angle to the tool's length. Very narrow-angled or curved tools are called veiners. Since the heavier cutting is first done by the gouge, and the chisel is then used largely to reduce the furrows to a smooth plane, carvers sometimes call the straight chisel a firmer, and it may be ground somewhat differently from the carpenter's chisel. The shanks of gouges and chisels may be given a variety of splayed ("fish-tail") and bent shapes for access to interior planes or to shape small planes efficiently in one stroke, and the width of the edge may vary from 1/8th of an inch up to 2 inches. An assortment of sizes in all available shank shapes could expand a wood-carver's collection of tools to a very high number, but a serviceable range can be made up of one or two dozen items.

Files and rasps in a range of shapes and degrees of fineness are used for smoothing the surface of the wood preparatory to the final sanding, although some artists prefer the more animated quality of the tooled surface. Some finishers recommend burnishing the surface with a harder piece of wood or with the standard burnishing tools (steel, agate, and so on) used throughout the crafts. A final finish may be applied in any of the well-known transparent substances such as shellac, varnish, oil, and wax—with or without preliminary use of a stain—or the work may be

painted with opaque substances, concealing the grain and applying a color scheme that is naturalistic or otherwise independent of the limited natural color range of wood. When this type of polychrome surface is to be used, fine sanding and other final-stage polishing techniques are generally omitted, and a prime coat with some body like gesso (fine plaster) is applied in order to achieve smoothness.

The fibrovascular structure of wood brings about certain conditions that must be taken into account by the carver. The cutting tool moves most readily in a direction generally paralleling that of the fibers ("with the grain"), but care must be taken not to split the wood. This precaution is less necessary with denser, close-grained woods, more necessary with lighter, open-grained woods. Projections should be made in a direction coinciding as closely as possible with the grain of the wood, as "short grain" is weak. That is to say, a piece of wood with the grain running at right angles to its length is apt to split off under pressure. For this reason it is necessary to design figures in wood somewhat massively, without too much articulation. The problem also may be overcome by carving different parts of the figure as an arm, a leg, and so on from different pieces of wood, with the grain in the right direction for each. Skilled techniques are required for assembling such figures; otherwise a generous amount of gesso must be used to conceal the joinings.

Trees grow only to a certain size, and a block may not be the full diameter of the trunk since it is inadvisable to use heartwood (the center of the log). This is because of excessive checking or cracking in that area from the tensions set up by shrinkage as the wood dries. Therefore, the scale of wood sculpture is limited; but there are ways of extending it somewhat. Planks can be "glued up" into sizable blocks. Jointing may be employed as described. Large compositions may be made by assembling a number of individually carved figures against a constructed background. In rare instances very large figures have been constructed on a wood framework with a planked surface.

Unlike metal and ceramic products, facsimiles of which may be produced by various casting techniques, a carving is unique. However, there are machines which can reproduce rapidly and simultaneously from a master pattern a number of simple pieces such as furniture details (the foot of a bureau or the arm of a chair), small objects such as smoking pipes, and even uncomplicated sculptural figures. These work either on the principle of the router (for flat panels or relief carving) or on that of the lathe (for three-dimensional pieces), with a series of tools cutting into a series of blanks until a controlling finger comes in contact with the surface of the master pattern. Elaborate shapes and undercutting cannot be accomplished in this manner, but the pieces produced by the "gang carver" generally are finished with varying amounts of hand tooling. The amount of hand tooling performed on such an individual piece is proportionate to the prospective price of the object.

For a discussion of wood carving in Canada, see CANADA—31. *Art and Architecture* (Decorative Arts and Crafts).

WOOD CHARCOAL. See CHARCOAL.

WOOD DUCK, a small American duck (*Aix sponsa*), the most beautiful of the ducks of North America. It inhabits quiet bodies of fresh water in wooded regions, especially swamps and secluded ponds, breeding from southern Canada west to Manitoba and south to Cuba and Texas, and from British Columbia to California. It is migratory, wintering from the southern United States to central Mexico and Jamaica.

Karl H. Maslowski from National Audubon Society
 Wood duck (*Aix sponsa*).

No words or picture can adequately express the beauty of the male wood duck, with its iridescent greens, purples, and blues, set off by bold patches, spots, and streaks of white and black. Its flanks are delicately streaked with brown and black, and it has a big flowing crest. The woodland setting enhances its beauty still further. The female is iridescent on the wing and has a short crest, but she is more sedate in coloration, chiefly grayish and brown. No other waterfowl is so handsome with the exception of the related mandarin duck (q.v.), *A. galericulata*, of Asia. The nest is placed in a hollow stump or a cavity of some standing tree, often at some distance from water; and when they are ready to leave the nest the young jump to the ground. The wood duck should be rigidly protected by law, but unfortunately it is still hunted. See also DUCK—*Perching Ducks*.

CHARLES VAURIE.

WOOD ENGRAVING AND WOODCUT, a print made from a block of wood by cutting away areas of the surface so as to leave lines that receive ink for transfer to the paper. Originally the woodcut was strictly a means of reproducing a line drawing, and at a very early stage the cutting was handed over to a specially trained group of crafts-

men, the artist being responsible only for the drawing itself. Specializing in this way, the wood-block cutters soon became highly skilled and capable of reproducing complex pen drawings, as can be seen in the work of Albrecht Dürer (1471–1528) and contemporary German artists.

As the painting mediums became more concerned with optic effects of light and shade, graphic mediums such as etching and engraving were invented to make similar tonal effects possible in prints. Wood engraving was developed for the same purpose. However, whereas the later graphic mediums are printed with ink deposited in lines cut into metal plates (*intaglio*), wood engraving prints ink deposited on lines or masses remaining at the original surface of the block (*relief*), exactly as woodcuts do. The difference is that in the earlier form (woodcut) the artist thinks only of the black lines of the drawing, cutting away the blank white areas, whereas in the engraving process the artist first blocks out a light and dark pattern, and in the dark areas simply reduces the darkness of the solid black tone by cutting relatively fine lines into it. Wood engraving is thus sometimes called the “white-line” method, as the artist no longer thinks exclusively in terms of the black lines in the drawing but also of the white lines that form the design and gray the dark masses.

An intermediate stage was the so-called *chiaroscuro* print, in which a light tint was printed under (before) the black-line woodcut, with a few highlights scooped out here and there, so that the final effect was that of introducing a halftone between the white of the paper and the black of the printed line (as in pen and wash drawing). Although this method involved cutting and printing an extra block, it simplified the cutting of the drawing immeasurably, as the tones built up with laboriously cut parallel and cross-hatched lines could be omitted. Wood engraving brought the lines and tones together again on one block and elaborated the development of the halftone.

Tools and Techniques.—Woodcut.—In the woodcut the design is generally cut on a plank of the desired size so that the grain runs with the surface. Any smooth-grained wood, such as cherry, American whitewood, maple, beech, sycamore, pear, or apple, may be used. The primary tool is a knife, supplemented by gouges for removing large areas. When cutting, the knife is inserted into the block on a slight slant so that the line or section to be eliminated will be smaller at the bottom, and in order that the wood which remains standing will have a wider base. The knife is drawn toward the body as it makes the cut. Another cut is made at an opposite angle to remove the wood between the lines, forming a trench. The artist may proceed as far as he wishes before taking a trial proof, or, if desired, he can cut out all the large areas with a gouge and then proceed with the finishing touches. Finally, the block is cleaned with a rag moistened with benzine or other cleaning fluid; then a dampened cloth is used to remove all traces of india ink or other drawing; and, when dry, it is carefully gone over with a soft brush.

The woodcut is now ready for printing. Printer's ink is rolled out evenly on a smooth stone or glass plate, and a hard roller charged with ink is run over the block. The ink remains on the surface of the raised lines, leaving the sections that have been cut away free from ink. For a trial

proof the paper is placed on the inked block and pressure is applied with a vertical press. When no press is available, the back of the print may be rubbed with a bone paper folder, the back of a spoon, or a burnisher, taking care that the paper is not torn by applying too much pressure, particularly along the sharp edges of the lines. If the block is small or thin, a smooth card can be placed over the printing paper to afford greater protection. When the rubbing is finished, the print (which is in reverse) can be carefully lifted from the block.

Wood Engraving.—Boxwood is used for wood engraving because of its hardness and fine grain. The block is cut across the growth of the tree, so that the composition can be engraved on the end of the grain. The trunk of the boxwood tree being limited in diameter, a number of sections are assembled to make the required size block, which is then cut to 0.9186 of an inch (standard type height). In modern printing, however, electrotypes are used for printing rather than the wood block itself. The block is then evened off, rubbed down, and polished until it has a perfect and flawless surface.

In wood engraving the drawing is transferred to the block in various ways. Apart from the more recent commercial method, the one most commonly used during the period of reproductive engraving was to cover the surface with a thin coating of Chinese white and then to draw or trace the design carefully with pencil. The tracing was carried far enough to indicate relative values as a guide to the engraver. Another method, more frequently used today, is to paint the block black with india ink and to transfer the design with red carbon paper. The artist then engraves directly through the ground, exposing the lines with the graver; these appear white against the darkened surface. The exact manner chosen is determined by the amount of preparatory work the artist desires on the block before engraving.

The tool used for engraving is the burin graver, of which there are many types and sizes, including the scorper, lozenge-shaped graver, spitz-sticker, tint tool, V or parting tool, gouge, chisel, and burnisher. These are mounted in rounded handles, cut away on the underside to avoid interference with the block when held low. The curved top of the handle fits into the palm of the hand; the thumb extends along the side of the blade, and the fingers are curved in such a manner as to press the tool against the ball of the thumb. In contrast to woodcutting (in which the knife is drawn toward the body), the graver is pushed away from the body, with just enough pressure to allow the burin to penetrate the wood. The block itself rests on a round leather sandbag, and the left hand moves the block from left to right so that the curved or parallel lines are engraved with ease. The artist may see his engraved work by rubbing a small amount of whiting (calcium carbonate) into the line. It is essential that all engraving tools be kept well sharpened; the perfect sharpening of the various kinds of tools is a precise art in itself.

Before printing, the block is cleaned with a soft brush. It is then inked and the trial proofs are taken in the same manner as the woodcut. Corrections of errors are difficult in wood engraving. An engraved block can be repaired by drilling a hole over the mistake and inserting a round, tapered piece of boxwood. The part of the peg

which protrudes above the block is then cut off as near the surface as possible, sanded over, and polished ready for the corrections. Lines may be reduced by rubbing them down with fine emery paper to obtain the necessary value of the line or mass.

History.—Early Works.—The actual date of the origin of printing from wood blocks is in doubt. In India wooden stamps have been in use for printing on fabrics from an early age, and in the 10th century the Chinese had books printed from tablets of wood. The illuminators of the Middle Ages in Europe used stamps as key blocks to produce initials on manuscripts, which they later colored by hand. The earliest known woodcuts, depicting scenes from the Scriptures and the lives of the saints, date from the early part of the 15th century. Prints taken from rudely cut blocks appeared in the books of the 15th and 16th centuries. Most of these prints, which originated in Germany and the Netherlands, were produced by hand rubbing. Often a pale brown ink was used, and sometimes was added with a brush. These so-called "block books" are noteworthy for their beautiful composition and design. The illustration and the text, usually in Latin, were cut on the same block—a practice which flourished up to the invention of movable type. Among the earliest and most important examples of the block books are the *Apocalypsis Sancti Johannis* (Visions of St. John), *Ars Moriendi* (The Art of Dying), and *Canticum Canticorum* (Canticle of Canticles). These works were published in many editions and enjoyed a wide circulation. See also BLOCK BOOK.

With the invention of printing by means of movable type in the mid-15th century, the woodcut was given a new stimulus. As books became more and more common, an increasing number of illustrations appeared. The Bible was the book on which the early printers spent most of their energies. Noteworthy among these Scriptures was the Cologne Bible, which appeared in 1478–1479 and contained 109 designs, the first illustrations of the Scriptures to appear after the block books. Along with the Bibles, numerous "chronicles" and histories became popular; these were conceived as records of legends dealing with the lives of the saints and great or imaginary happenings in local history. One of the best known of these chronicles was published at Nürnberg in 1493. The work, which has more than 2,000 cuts (views of cities, portraits of saints, and so on), is said to have been supervised by William Pleydenwurff (d. 1494) and Michel Wohlgemuth (1434–1519), the latter a teacher of Dürer.

In France, woodcut was early identified with printing. Religious books contained beautiful and painstakingly wrought illustrations. Those known as the *livres d'heures* (books of hours) are most notable. Often the prints were hand colored and decorated with gold, and the books were further enhanced by decorative borders. See also BOOK OF HOURS.

The woodcut was introduced to Italy by German printers, and Venice became an important center of the art. The most noted example of early Italian woodcut is in the *Hyperboreomachia Poliphili* (Dream of Poliphilo), written by Francesco Colonna in 1467 and printed by the famous Aldus Manutius (1450–1515) in Venice in 1499. The work has 192 woodcuts.

Dürer and Holbein.—The genius of Albrecht Dürer (q.v.) brought woodcut to its highest achievement. He was a draftsman as well as a

craftsman, with a far-reaching and powerful imagination and a thorough knowledge of the new spirit of approaching reformation. He was the first to realize fully the possibilities of woodcut, and by his influence he raised it to the realm of a fine art. Among his greatest accomplishments were the 15 compositions to illustrate the *Apocalypse of St. John* (1498), and the *Large Passion of Our Lord*, with 12 cuts, of which 7 were executed in 1498, the remainder being finished in 1510 and the set being published with the Latin text in 1511. The *Life of the Virgin*, with 20 cuts, falls entirely within the first decade of the 16th century and was printed on Dürer's printing press in 1511. The *Small Passion of Our Lord* (1511), which has 37 prints, is equally famous.

Dürer's great talent and masterly use of the burin in woodcut gave rise to a school of artists known as the "Little Masters," whose work created a renaissance in decorative and religious subjects. They included Hans Sebald Beham (1500-1550), Hans Baldung (1476?-1545), Heinrich Aldegrever (1502-1560), and Jost Amman (1539-1591).

The great number of woodcuts known to be by Hans Holbein the Younger (1497?-1543) are too numerous to attempt mention of them individually. There is no doubt that Holbein knew the technique of woodcut; however, it has been established that Hans Lützelburger, with his profound understanding of the art of engraving and woodcut, knew how to interpret every meaning of Holbein's drawings. Among the first books Holbein illustrated were the *Utopia* of Sir Thomas More and Biblical translations of Martin Luther. The *Dance of Death* series of 1538, containing 41 small cuts, is considered the most famous of all interpretations of this popular subject. Although measuring only 2 by 3 inches, they display extraordinary power of observation combined with great simplicity of composition and draftsmanship. People in all walks of life, from the king and queen to the fool who tries to escape death, are represented in this series. Holbein's *Alphabet of Death* and 86 designs for the Old Testament, along with many other book illustrations, must be considered on the same plane of creation and workmanship as the above-mentioned series.

Early in the 16th century, both the German Jost de Negker (1485-1544) and the Italian Ugo da Carpi (c. 1455-c. 1523) claimed to have invented the chiaroscuro print, a process by which color effects were gained through the use of several blocks to produce tones, printing one over the other. It is now recognized that the technique originated in Germany and that da Carpi, who coined the term *chiaroscuro*, contributed improvements in the new method. He produced several of Raphael's compositions by this technique, and in Germany impressions were made from the designs of Johann (Hans) Wechtlin (1460-1526), Hans Burgkmair (1473-1531), Lucas Cranach the Elder (1472-1553), Hans Baldung, and other artists.

During the 17th and 18th centuries the art of woodcut and wood engraving was overshadowed by the development of copper engraving as a means of reproducing original works of art. Little of technical or artistic innovation dates from this period. The mediums of woodcut and wood engraving continued to be used, but chiefly as a means of illustrating cheap, popular types of books, journals, and broadsides.

Bewick and the 19th Century Revival.—A revival in wood engraving began with the work of Thomas Bewick (1753-1828) in England. To him we owe the bringing into general use of the technique of white-line engraving, which eliminated the old method of cutting the wood away from the lines. He was the first, or one of the first, to use boxwood and the burin. Bewick is best known by his engravings for the *General History of British Quadrupeds* (1790) and *History of British Birds* (2 vols., 1797, 1804). He was the founder of the modern British school which held a distinguished place in modern illustrative art, and which included Charlton Nesbit (1775-1838), Luke Clennell (1781-1840), Allen Robert Branstons (1778-1827), John Thompson (1785-1866), Edward Dalziel (1817-1905), George Dalziel (1815-1902), William Harvey (1796-1866), and William James Linton (1812-1897). In 1820 the artist-poet William Blake designed 13 woodcuts for Robert John Thornton's *School Virgil* (*Bucolics*), published with Blake's designs as *Illustrations of the School Virgil* (1824). These small blocks, although crude in technical handling, have powerful design and much pastoral charm. A great accomplishment of the later 19th century in England was the *Kelmscott Chaucer*, published in Hammersmith in 1896 under the direction of William Morris. This book was one of the most impressively designed and illustrated volumes produced since the decline of printing in Venice; it contains illustrations engraved in wood by William Hooper (1834-1912), after designs by Sir Edward Coley Burne-Jones. Other fine engravers of this period are Charles Ricketts (1866-1931), Charles Shannon (1863-1937), and Thomas Sturge Moore (1870-1944).

In Germany, where the art of wood engraving was long in decline, a new life was developed late in the 18th century by Johann Georg Unger (1715-1788) and his son, Johann Friedrich Unger (1753-1804). Adolph F. E. von Menzel (1815-1905) trained Hans Alexander Mueller (1888-), Eduard Kretzchnar (1807-1859), and Friedrich L. Unzelmann (1797-1854) to reproduce his work.

From rather primitive beginnings, engraving in the United States was rapidly developed into a highly commercial reproductive art of a technical excellence unrivaled by similar efforts in other countries. By the second half of the 19th century such firms as Harper & Brothers, Charles Scribner's Sons, and the Century Publishing Company were among the leading publishing houses to make extensive use of wood engraving for illustrations in their books and periodicals. The drawings and paintings of many well-known artists, such as Winslow Homer, were made popular by black-and-white engravings which appeared regularly for a period of years in *Harper's Weekly*. These were first done by the old style of wood engraving, with the drawings carried by the black lines against the white background, but later in the 19th century a refinement of the Bewick system, using the white line to define the forms and carry the drawing, came into use. The cutting of these blocks was done according to strict conventions, carried to a degree of precision seldom attempted before. The use of a multiple graver and the use of stippling aided in evolving this manner, which sought to reproduce original works and photographs with a close fidelity to the spirit of the original. The blocks were cut on the end grain of the wood and were capable of printing

thousands of identical impressions quickly and cheaply. This type of engraving became known as the "New School of Engraving," whose more notable members included Timothy Cole (1852-1931), Henry Wolf (1852-1916), Gustav Kruell (1843-1907), T. A. Brothers, William James Linton (who had gone to the United States in 1866), Ernst Schladitz, and Hiram C. Merrill (1867-1958). Cole was perhaps the most accomplished of this group. The greater part of his output consisted of black-and-white translations of well-known paintings by European old masters. Within the limitations imposed by the medium, Cole's technique often suggested color values and usually gave an over-all effect of a rich and sensitive interpretation of the original.

With the introduction of modern means of photoengraving and the halftone process during the closing years of the 19th century, the veritable armies of commercial engravers who had done mass production work for the newspapers and publishing firms were no longer needed. This brought about a gradual disuse of this highly developed, commercial method of engraving.

Even before this transition was well under way in the United States, certain French artists such as Félix Vallotton (1865-1925), Louis Auguste Lepère (1849-1918), and Paul Gauguin (1848-1903) were working independently along divergent paths which were to be recognized eventually as the start of a renewed interest in original creative work in the mediums of woodcut and wood engraving. They were among the first to make use of these mediums in a more truly individual way than had been attempted previously. Of the three, Gauguin had the greatest influence on the present day approach to the woodcut. His style was characterized by an intensity of personal expression, both in his choice of subject matter and in his cutting technique. Both line work and irregular black-and-white design elements were sometimes combined with one or more colors to heighten the symbolic character of the work as a whole. Although not fully understood or appreciated during his lifetime, or for some years thereafter, his use of the woodcut as an original artistic medium proved to be a strong influence on Edvard Munch (1863-1944) of Norway. This artist carried Gauguin's concept of color as a dramatic element a step further and used the subtle variations of the natural grain of the wood to produce effects of great power and imagination. Like Gauguin, Munch cut on the plank side of the wood, often creating prints of large dimensions.

The 20th Century.—Beginning in 1905, a group of artists who have been since referred to as the German expressionists began to make woodcuts which were inspired by the bold, dramatic approach initiated by Gauguin and Munch. Their work is dominated by subjects which reflect deeply felt emotions. Their technique, though spontaneous in appearance, is combined with a strong sense of design and controlled by drawing of an unadorned directness. Foremost in this group were Emil Nolde (1867-1956), Max Pechstein (1881-1955), Karl Schmidt-Rottluff (1884-), Ernst Ludwig Kirchner (1880-1938), Max Beckman (1884-1950), and Erich Heckel (1883-). Käthe Kollwitz (1867-1945), working somewhat independently, also produced woodcuts of great power and depth. Their work as a whole reveals a subjective reaction to the social upheaval and political violence which swept

over much of Europe during this period. Natural forms were purposefully exaggerated and distorted to produce shocking emotional impact. Patterns of black and white and the use of strong tonal contrasts which often incorporated stark colors are typical. Also working in Germany, although somewhat apart from the main movement of this period, was Ernst Barlach (1870-1938), who was devoutly occupied with religious subjects. He evolved a stylistic idiom of his own which recalled certain aspects of the German woodcuts of the 15th and 16th centuries.

Early 20th century woodcut and wood engraving in France took many diverse forms. The reputation of the French work stems more from its examples of high quality of individual achievement than from the formation of a definite school such as that of the German expressionists. Much of the best work in France in woodcut and wood engraving during the present century has been done as illustration for the fine published literary works which have appeared in handsomely bound limited editions. Outstanding among these are the woodcuts of Aristide Maillol (1861-1944) for *Daphnis et Chloë* (new ed. 1949). Eminent artists such as Pablo Picasso (1881-) and Georges Rouault (1871-1958) produced designs which were engraved by others as plates for a number of publications of Ambroise Vollard. Other artists working in France at this time were Jean Emile Laboureur (1877-1943), Raoul Dufy (1877-1953), and Démétrios Galanis (1882-).

Mention should be made of the woodcuts of Wassily Kandinsky (1866-1944). This artist, of Russian origin, created a number of prints which combine the mediums of woodcut and wood engraving, and his compositions are among the finest examples of abstract art yet to be seen in any medium.

Significant earlier 20th century American wood engraving and woodcut may be found in the prints of Rockwell Kent (1882-), Thomas Nason (1889-), Asa Cheffetz (1896-), Julius J. Lankes (1884-), Paul Landacre (1893-), and Lynd Ward (1905-). Their subjects deal primarily with the American scene in a regional sense. The blocks are executed in the traditional techniques, based on the standards of fine workmanship established by the reproductive engravers of the late 19th century. There are, however, definite personal variations in their cutting methods, along with an originality of subject and a freedom of handling not found in the earlier period. Kent is noted for the literary character of his work as well as for his mastery of design and technique. Much of his output appears as illustrative material in fine published works written by Kent himself. Ward's keen analysis and sensitive feeling for his subject may be found in *God's Man* (1929), *Madman's Drum* (1930), *Wild Pilgrimage* (1932), *Song Without Words* (1936), and *Vertigo* (1937), all of which are symbolic narratives related entirely through the medium of woodcuts, without the aid of written texts.

Mid-20th century American woodcut and wood engraving exhibits a still greater departure from tradition. Much of the work has been conceived with a great deal of vitality and inventiveness. The styles in use reflect a somewhat eclectic mixture of influences which may be traced back to German expressionism, abstract art, and also primitive art, in various combinations. Unusual color effects and tonal nuances have been introduced. Prints have become increasingly larger in

size and more striking in character, serving more often as wall decoration than as book illustration. Although the tools of the medium have not changed greatly, the possibilities of technical variation have been explored as regards cutting and printing methods. There has been a rapid exchange and interaction of influences between artists the world over. Styles and techniques have become less limited to national boundaries, and a distinctly international character is evident in prints done since the end of World War II. American prints representative of these developments are found in the work of Antonio Frasconi (1919-), Misch Kohn (1916-), Louis Schanker (1903-), Seong Moy (1916-), Leonard Baskin (1921-), Adja Yunkers (1900-), Rudy Pozzati (1922-), and many others. At the same time, the more traditional methods and more conservative styles continue to be practiced by such artists as Fritz Eichenberg (1901-), Grace Albee (1890-), Nora Unwin (1907-), Clare Leighton (1901-), Letterio Calapai (1925-), and Hans Jelinek (1910-).

Engraving in England in the 20th century has flourished, notably under such artists as Eric Gill (1882-1940), Paul Nash (1889-1946), John Nash (1893-), Gwendolen Raverat (1885-1925), and Charles F. Tunnicliffe (1901-).

Japanese Woodcuts.—The Japanese woodcut has influenced contemporary artists working in the medium in Europe and the United States for several generations. Early Japanese art was linked to the culture of China, particularly in the visual arts. The Japanese learned the same techniques in the application of color and use of line as were employed by the Chinese in their paintings. Since the Japanese artists devoted themselves principally to the problem of decorative composition, it was a natural step to the color woodcut, on which they concentrated much of their genius. The line supplied the drawing, detail, form, and structure. This, coupled with the Japanese tradition of craftsmanship and sensitive interpretation in supporting the line with color, resulted in masterpieces which are now universally known. The leading masters of the school of Ukiyo-e, which flourished during the Edo period (c. 1615-1867), and those who contributed most to the development of the color woodcut were: Moronobu Hishikawa (1618-1694), Harunobu Suzuki (1725-1770), Kiyonaga Torii (1752-1815), Utamaro Kitagawa (1753-1806), Hokusai Katsushika (1760-1849), and Hiroshige Utagawa (Ando Hiroshige, 1797-1858); there were also other masters of lesser importance. Their innate sense and inherent passion for design and composition were demonstrated in their power to illustrate fully the poetry and mystery of their artistic heritage. The tools, and methods of using them, differed little from those used by the early European masters, but there was a vast difference in the printing from the block.

The method of transferring the original drawing to the block varied slightly from contemporary practice. The face of the block was covered with a thin coating of rice paste; the tracing from the drawing was then placed, face down, on the prepared surface and secured thoroughly by rubbing with a baren.¹ When dry, the block, usually of

cherry wood, was ready for cutting, with the knife interpreting the line work of the original drawing. When completed, this was known as the key block since it controlled the registration marks on the color blocks that followed.

The first step in printing was the preparation of the paper. Japanese rice papers, usually Torinoko or Hoshio, were ideal for woodcuts because of their absorbent quality and capacity to receive color and the grain of the wood, if desired. The paper was first sized with thin gelatin and then dampened evenly and to the right degree with a soft brush. The block was wet with a sponge and made ready to receive the water color, which was mixed to the desired intensity according to the chosen color scheme. The colors were painted on with a comparatively dry brush in several directions on the block in order to ensure even, flat tones, if desired. To print gradations of color, one end of a wide moistened brush was charged with color and applied in the required direction. In the hands of an expert the color gradated itself and even diminished to a very light tone onto the white unpainted areas.

The number of colors used determined the number of blocks, which were all printed separately in sequence while the paper was still damp. This was necessary so that all states would register correctly. The key block, printed in black India ink, was the last to be made, and pulled the color impressions together into a well-coordinated whole. Some artists printed the key block first to facilitate registration.

The color and key blocks were transferred to the paper by rubbing the baren with the grain of the wood in an even or increasing pressure, according to the required result. The prints were then dried between weighted drying boards which were thick enough to absorb the remaining dampness in the print.

WOOD FINISHING. See WOODWORKING.

WOOD GREEN, municipal borough, England, in Middlesex, 7 miles north of London's St. Paul's Cathedral. It is a residential borough in the suburban area of Greater London, chartered in 1933, and containing within its boundaries most of Alexandra Park and Alexandra Palace. The

¹ A thin disk of stiff paper of papier-mâché on which a coil or mat of tightly braided fiber was fitted. This was encased in an unblemished bamboo leaf, which formed a hard, smooth surface for printing. The ends of the leaf were twisted on the reverse side to secure the rubbing surface and to form a convenient handle.

New River, an artificial waterway constructed in 1609, flows through the borough. The British Broadcasting Corporation maintains a television news studio here. Pop. (1961) 47,897.

WOOD HEWER, a bird of the family Dendrocolaptidae, restricted to the forests of the New World from Mexico south to Argentina. The family numbers nearly 50 species and is best represented in the Amazon Basin. Wood hewers are medium-sized or small birds, ranging in size from that of a dove to that of a wren, and have a brown or grayish plumage, spotted or streaked with black, white, or buff, and with reddish areas in the wing and tail. The wood hewers are not related to the true tree creeper (family Certhiidae) although their habits are very similar, inasmuch as they are constantly searching and probing the crevices or the bark of trees for insects. The hewers are well adapted to this mode of life: the tips of their tail feathers are stiffened for support and sometimes end in spines, as in the woodpeckers; and they have very strong toes and claws and, usually, a long, slender bill. The term "hewer" is misleading, as the birds, though they may pry off bits of bark or moss, do not chop into the tree.

CHARLES VAURIE.

WOOD IBIS. See STORKS.

WOOD LARK, a characteristic songbird (*Lullula arboraea*) of western Eurasia, which breeds also in northwestern Africa. It is about six inches in length, with a streaked plumage, and resembles the more familiar skylark to which it is closely related. It differs from it, however, in being more richly colored with a more strongly contrasting pattern, and by frequenting regions interspersed with scattered trees on which it often perches, whereas the skylark is strictly terrestrial and avoids regions or sites where there are trees. The male wood lark rises to sing and descends with a more circular spiraling flight than that of the skylark. The wood lark breeds from Great Britain eastward to the Ural Mountains, Turkmen SSR, and Iran, and south to Morocco, Algeria, and Tunisia.

CHARLES VAURIE.

WOOD LOUSE (also called **PILL BUG** and **SOW BUG**), a small terrestrial animal with some resemblance and relationship to lice or bugs (which are insects), but belonging to a group of crustaceans known as Isopoda, which also contains aquatic members. The terrestrial members live under fallen logs and bottom debris in humid woods, and also in gardens under stones, boards, flowerpots, and the like. The wood louse is a small, gray, flattened creature with a jointed body and a pair of feelers (antennae) and compound sessile eyes at the anterior end. Each of the first seven body joints, constituting the thorax, bears on its underside a pair of walking legs. The following smaller abdominal joints have flat respiratory plates on their undersurface. (Isopods are primarily aquatic, but some have adapted to terrestrial life by developing th

iratory plates, which may contain a not air tubules like the tracheae of in- The sexes are separate; after mating, the carries the developing eggs in a brood (on the underside of the thorax) formed overlying plates borne on the bases of the

first five pairs of legs. Here the eggs develop into fully formed young which are like the adults except in size. Isopods feed primarily on decaying organic material, and are of small economic importance. Most of the species seen in woods and gardens are importations from Europe; they have become distributed throughout the world by way of plant shipments. See also ISPODA.

LIBBIE H. HYMAN.

WOOD NYMPHS (sometimes called **DRYADS** or **HAMADRYADS**), in classical mythology, those among the lesser goddesses known as nymphs who made their homes in forests and trees. See NYMPHS.

WOOD OIL. See ALEURITES; TUNG OIL.

WOOD PEWEE, wōd pé'wē, the name of two small flycatchers of the family Tyrannidae. This family is found only in the Americas, and the better known of the two species, the eastern wood pewee (*Contopus virens*), breeds only in Canada and the United States. The western wood pewee (*C. sordidulus*) breeds in the western part of the continent from Alaska to northwestern Mexico. The two birds are about 6½ inches in length and dull and inconspicuous in coloration. They are grayish olive above with a whitish throat, a gray breast, and pale abdomen. They are not true songbirds in the technical sense, but nevertheless have a very pleasing voice. The notes of the eastern wood pewee are slurred and plaintive, with a regular pattern; those of its western relative are whistled and given forth more rapidly. The difference in the voice is the chief distinguishing feature between the two species. As their name indicates, both pewees inhabit the woodlands. See also PEWEE.

CHARLES VAURIE.

WOOD PIGEON, a well-known pigeon (*Columba palumbus*) of the Old World, of the family Columbidae. It breeds in the Azores, Madeira, and from northern Africa and Europe eastward to the province of Sinkiang, China, and the Himalaya. It is about 16 inches in length and heavily built, bluish-gray, and somewhat similar to the domestic pigeon, from which it differs, however, by having a conspicuous white patch at the sides of the neck and a broad white band on the wing. It normally frequents woodlands but is a familiar sight in the parks of even the largest cities, such as London or Paris, where it has become very tame. It is omnivorous and in certain regions is often quite destructive of crops. See also COLUMBIDAE; PIGEON.

CHARLES VAURIE.

WOOD PULP. See **CHEMICAL INDUSTRIES—Pulp and Paper**; **PAPER**; **WOOD—6. Wood Chemistry Products** (Wood Pulp and Products).

WOOD RAT, a rat-like wild rodent (*Neotoma*), native to much of the United States. The head and body are six to nine inches in length and the tail nearly as long. The coat is soft-textured and gray or brownish, the under surface gray or white, the tail hairy (not scaly), and the ears large and thin. All species accumulate sticks and debris as nests. Eastern species favor cliffs for shelter; plains or desert wood rats make rounded nests two to four feet high amid cactus, yucca, or brush; the bushy-tailed species of the Western

mountains inhabit cliffs or rock slides; and the dusky-footed wood rat of California makes nests in live oaks.

These animals are often called pack rats, because they commonly take tableware or other bright objects from camps or cabins; they are also known as trade rats since they sometimes leave bits of debris, as if in exchange.

TRACY I. STORER.

WOOD-RIDGE, borough, New Jersey, in Bergen County, 3 miles southeast of Passaic and 8 miles northeast of Newark. The community is mainly residential, though aircraft engines are manufactured. The area was part of a large tract of land granted by the provincial New Jersey governor, Philip Carteret, to Capt. John Berry in 1669. It was subsequently divided into farms and in the early part of the 19th century settled by farm workers. The borough was incorporated in 1894 and is administered by a mayor and a council. Population: 7,506.

WOOD RIVER, city, Illinois, in Madison County on the east bank of the Mississippi River, 16 miles north-northeast of downtown St. Louis, Mo., and 6 miles southeast of Alton, Ill. It is an industrial community, and was established in 1907 as the site of a large oil refinery; it has since acquired a tank-car shop and pipeline terminals. Located nearby, at the mouth of the Wood River during the winter of 1803-1804, is the site of the encampment where Meriwether Lewis and William Clark recruited and trained members of the expedition which was to explore the Pacific Northwest. Incorporated as a village in 1911, and as a city in 1923, Wood River has had a council-manager government since 1953. Population: 11,490.

WOOD SCULPTURE. See WOOD CARVING.

WOOD SORREL, the colloquial name of various species of plants in the genus *Oxalis*, especially *O. acetosella*. Technically, the term sorrel refers to the acid sap, which is protective against slugs. *O. acetosella*, the white wood sorrel, one of the plants sometimes called shamrock, is widely distributed in rich woodlands in temperate North America, Europe, and Asia. It has trifoliate leaves and five white petals, about ½ inch in length, with pink veins; rose-colored forms also occur. *O. violacea*, the violet wood sorrel of North America, has purple petals ½ inch long, and is bulbous at the base. A number of ill-defined, widely distributed species of yellow wood sorrel, with small flowers less than ½ inch long, occur as common weeds, including *O. stricta*, which is a native of the New World, and *O. corniculata*, of the Old World. Some of the more showy wood sorrels are cultivated, such as *O. Bowiei* of South Africa, which has rose-colored flowers nearly 2 inches in diameter. See also OXALIS.

EDWIN B. MATZKE.

WOOD SWALLOW, a songbird of the family Artamidae. The family consists of 10 species distributed from India and the Philippine Islands to Fiji and Australia. The family is most abundant in Australia where six of its species are found. Their nearest relatives are uncertain but may consist of the shrikes and waxwings, not the swallows, to which, however, they bear a super-

ficial resemblance in that they are long-winged and are very agile flyers which feed chiefly on insects caught on the wing. The wood swallows vary in length from about six to eight inches and are all plainly colored, being usually soft gray above. They build a very frail nest of grasses and twigs, usually placed in a tree.

CHARLES VAURIE.

WOOD THRUSH, a familiar thrush (*Hylocichla mustelina*) of eastern and central North America. It is eight inches in length and reddish brown above with many large, rounded, blackish spots below on a whitish background. The song is always beautiful and liquid, with a flutelike quality best appreciated at dusk, from some distance. The wood thrush's most favored habitat is deciduous woods, especially when moist and with dense undergrowth, but it has spread also to more open or built-up areas, including the suburbs of the largest cities, provided it can find shaded lawns with dense shrubbery. The breeding range extends from southeastern South Dakota and central Minnesota east to southern Quebec and south to Texas, Louisiana, and northern Florida. It is migratory, wintering from southern Texas and Mexico to Panama.

See also THRUSH.

CHARLES VAURIE.

Wood thrush (*Hylocichla mustelina*). Its song is considered the finest of any American bird's.

Allan D. Cruickshank from National Audubon Society

WOOD WARBLER. See **WARBLER**—*New World Warblers* (*Wood Warblers*).

WOODBERRY, wōōd'bēr-ē, **George Edward**, American critic, poet, and educator: b. Beverly, Mass., May 12, 1855; d. there, Jan. 2, 1930. After graduating from Harvard in 1877, he taught English at the University of Nebraska for a time, became a frequent contributor to the *Atlantic Monthly* and the *Nation*, and was literary editor of the *Boston Post* in 1888. His *Life of Edgar Allan Poe* (1885; enl. ed., 2 vols., 1909) brought him recognition as a literary biographer and critic of the first quality, and remains a classic. A first book of poems, *The North Shore Watch and Other Poems* (1890), and a collection of essays, *Studies in Letters and Life* (1890), contributed further to his reputation. Appointed professor of literature at Columbia University (1891) and subsequently professor of comparative literature (1900), Woodberry was an outstanding teacher who generated enthusiasm for literature in his students and did much to encourage undergraduate writing. He also strove to liberalize graduate literary studies, and initiated and edited the pioneering series *Columbia University Studies in Comparative Literature* (9 vols., 1899–1903). During this time he published *Wild Eden* (1899), a book of lyric verse; *Heart of Man* (1899), a collection of essays relating the imaginative aspects of poetry, politics, and religion; and *Nathaniel Hawthorne* (1902), a biography which took its place as a classic beside his work on Edgar Allan Poe.

Woodberry resigned his position at Columbia in 1904, but continued to lecture from time to time at various universities in the United States and traveled in the Mediterranean region. Collections of essays based on his lectures were published, notably *The Torch* (1905), which presented his philosophy of literature in the New England transcendentalist tradition. *Ralph Waldo Emerson* (1907) was another important critical biography. *Ideal Passion* (1917), a collection of sonnets showing the influence of his travels in the Mediterranean, and *The Roamer and Other Poems* (1920), a collection of most of his poetry, were the major publications of his later years. Woodberry also edited *The Complete Poetical Works of Percy Bysshe Shelley* (4 vols., 1892) and, with Edmund C. Stedman, *The Works of Edgar Allan Poe* (10 vols., 1894–95).

ROSAMOND MUELLER.

WOODBINE. See **VIRGINIA CREEPER**.

WOODBIDGE, wōōd'brij, **Frederick James Eugene**, American educator and philosopher: b. Windsor, Ontario, Canada, March 26, 1867; d. New York, N.Y., June 1, 1940. He graduated from Amherst College (1889) and Union Theological Seminary (1892), and studied subsequently at the University of Berlin. After teaching at the University of Minnesota from 1894, he began his distinguished association with Columbia University, where he was appointed professor of philosophy in 1902. Two years later he became the first Johnsonian professor and from 1912 served also as dean of the graduate faculties, introducing a program of graduate research which contributed much to Columbia's outstanding position among American universities. He stayed on as professor for another decade after resigning as dean in 1929. Woodbridge was cofounder of

the *Journal of Philosophy, Psychology, and Scientific Method* (1904; renamed the *Journal of Philosophy*, 1920), which he edited for the rest of his life, and was a leading spokesman of the emerging realist movement in American philosophy, with its roots in the Aristotelian tradition. His books include *The Philosophy of Hobbes*, (1903), *The Realm of Mind* (1926), and *Nature and Mind* (1937). *Contrasts in Education* (1929) presents his philosophy in that field.

WOODBIDGE, town, Connecticut, in New Haven County, adjacent to the city of New Haven on the west. The town is mostly residential, with agriculture the chief economic activity. Formed from parts of New Haven and Milford, it was incorporated in 1784. Its government is by town meeting, selectmen and -women, and a board of finance. Population: 7,924.

ROBERT C. SALE.

WOODBIDGE, township, New Jersey, in Middlesex County, just north of Perth Amboy, across the Arthur Kill channel from Staten Island. Clay deposits have fostered industry in terra cotta, tile, bricks, and ceramics. Other industrial activity includes boatyards and the manufacture of chemicals, soft beverages, office equipment, dairy products, and brewery supplies. The site was settled in 1665 by John Woodbridge and other Puritans from Massachusetts Bay and New Hampshire, and the township was incorporated four years later. The first printing press in New Jersey was established here in 1751 by James Parker, but his periodical, the *American Magazine*, soon failed. Woodbridge was a popular watering place in the 1880's. It includes the villages of Fords, Sewaren, Hopelawn, Port Reading, Keasbey, Colonia, Iselin, Avenel, and Menlo Park Terrace. Government is by mayor and council. Population: 93,086.

WOODBIDGE, a community in the town of Vaughan, Ontario, Canada, in the regional municipality of York. It is on the Humber River, near the confluence with the East Branch, 1.5 miles (2.4 km) north of Toronto. Woodbridge was founded early in the 19th century as a millsite and service center for the adjacent agricultural area of Vaughan Township and was incorporated as a village in 1882. The Woodbridge agricultural fall fair was long one of the largest and best attended in the province. Archaeologists uncovered the site of an Indian village nearby. Woodbridge became part of the town of Vaughan in 1971.

D. F. PUTNAM*, *University of Toronto*

WOODBURY, wōōd'bēr-ē, **Charles Herbert**, American artist: b. Lynn, Mass., July 14, 1864; d. Boston, Jan. 21, 1940. A graduate of the Massachusetts Institute of Technology (1886), he studied art in Paris at the Académie Julien and later established himself in the Boston area as a marine painter and teacher. For many years he conducted a summer school at Ogunquit, Me., whose setting inspired many of his seascapes. Among his paintings are *Ogunquit, Maine* (Metropolitan Museum of Art, New York City), *The North Atlantic* (Worcester, Mass., Art Museum), *Off the Florida Coast* (Museum of Fine Arts, Boston), *Mid-Ocean, A Heavy Sea, Maine Coast*, and *The Ground Swell*. He wrote *Painting and the Personal Equation*, with E. W. Perkins (1922), and *The Art of Seeing* (1925).

WOODBURY, Levi, American cabinet officer and justice of the Supreme Court: b. Francetown, N.H., Dec. 22, 1789; d. Portsmouth, Sept. 4, 1851. Graduated from Dartmouth in 1809, he was admitted to the bar in 1812 and practiced at Francetown and Portsmouth until his election as clerk of the state Senate in 1816. The following year he was named associate justice of the state Superior Court and in 1823-1824 was governor. Woodbury represented New Hampshire in the United States Senate from 1825 to 1831, when he joined Andrew Jackson's cabinet as secretary of the navy. In 1834 he became secretary of the treasury and proved to be a formidable fighter for an independent federal Treasury and a vigorous supporter of Jackson's successful campaign against the Bank of the United States. Woodbury remained at the Treasury through the administration of Martin Van Buren, and upon retiring from office in 1841 he was reelected to the federal Senate. In 1845 President James K. Polk appointed him associate justice of the United States Supreme Court. On the bench he upheld the states' rights doctrine on the question of slavery, although he was personally opposed to slavery itself. He was also a vigorous advocate of free public education, systematic teacher training, and public facilities for adult education. *The Writings of Hon. Levi Woodbury, Political, Judicial, and Literary* was brought out posthumously by Nahum Capen (3 vols., 1852).

WOODBURY, Walter Bentley, English photographer and inventor: b. Manchester, England, June 26, 1834; d. Margate, Sept. 5, 1885. The lure of the goldfields drew him in 1852 to Australia, where he practiced his hobby of photography in Melbourne. After moving to Java in 1858, he achieved good results with the recently developed wet collodion process. Returning to England in 1863, he established himself in Birmingham and in the following year invented a new method of photoengraving which came to be known as the woodburytype process (patented July 24, 1866). He subsequently took out more than 20 patents on various photographic devices and techniques of photomechanical printing. See also **WOODBURYTYPE PRINTING**.

WOODBURY, city, New Jersey, seat of Gloucester County, on Woodbury Creek, eight miles southwest of Camden. Located in a rapidly growing suburban area, the city is primarily residential with a few local industries, including the manufacture of cement products, clothing, and electrical precision parts. It is also a cultural center, with a symphony orchestra, a choral society, and art and drama groups. Several notable 18th century buildings survive, including the boyhood home of Capt. James Lawrence (q.v.); the Cooper House, used as a headquarters by Earl Cornwallis before the Battle of Red Bank (1777); and the Friends' Meeting House. Woodbury was settled in 1681 by the Wood family, Quakers from Bury, England; it was incorporated as a borough in 1854 and as a city in 1871. It has a mayor-council government. Population: 10,904.

RUTH W. LINDEROTH.

WOODBURYTYPE PRINTING, wŏd'bĕr-ē-tīp prīnt'ing, a photogelatin process, one of the early methods of photomechanical reproduction. Although it provided excellent printed copies of photographs, it is primarily of historic interest

today. It was developed by Walter Bentley Woodbury (q.v.) and first shown by him in 1866 in the *Photographic News*. The process relies on the change of the solubility of bichromated gelatin when exposed to light.

To make the woodburytype printing plate, the image to be reproduced must first be obtained in a photographic negative as is done in other processes of photomechanical reproduction. Next a relief image or mold must be made: to do this, a layer of bichromated gelatin is exposed to light through the photographic image or film. Where unobstructed light reaches the gelatin, it is rendered highly insoluble; where no light comes through, it remains soluble; and as the light varies between these extremes, so is the solubility affected. The gelatin is then placed in warm water, and a relief image is produced by washing away the soluble gelatin. The remaining gelatin is hardened in a solution of chrome alum, and the completed mold is achieved, a hardened, washed-out gelatin relief, which, when impressed in type metal under great pressure, produces an intaglio (q.v.) metal plate. Since the gelatin mold is considerably harder than type metal, many printing plates can be made from a single mold.

The metal plate must be lightly oiled before printing. It is then filled with pigmented gelatin. Smooth paper, specially treated with varnish, is held under firm impression a few minutes until the gelatin sets; upon removal of the paper, the film of gelatin adheres to it. An excellent, crisp reproduction results. Actually the reproduction achieved is a replica of the original gelatin mold in a very thin film of pigmented gelatin. The dark areas are thickest, and the highlights are thinnest. In normal production the long wait for the gelatin to set under impression was offset by having one pressman attend several presses in rotation. The process was greatly limited as to size, the maximum being about a foot square. The presses were thus small and of the type used for simple copying.

Woodburytypes, as such reproductions came to be known, were produced in the United States, England, France, and Germany. In his annotated catalog (1892) of the Boston Museum of Fine Arts' Exhibition Illustrating the Technical Methods of the Reproductive Arts, Sylvester R. Koehler described the process as one that "gives very beautiful results, but unfortunately the prints are apt to become brittle, from drying-out, and to chip off." This brittleness is noticeable in surviving prints.

It is notable that the collotype, which was developed at about the same time as Woodbury's process, also used bichromated gelatin. But in making use of the degree of solubility of the treated gelatin, collotype applies this characteristic to the principle that oil and water do not readily mix and, as in lithography, moistens the gelatin film before inking. According to the degree of solubility, the gelatin collotype plate then accepts or rejects ink, recreating the image desired. Collotype today, of all reproduction methods, produces the greatest range of tone in the gray scale and is widely used. See also **LITHOGRAPHY - Related Processes**.

Slowness of production, fragility of prints, and improvement of quality in other cheaper, faster processes have led to virtual disuse of woodburytype printing.

BRUCE GENTRY,
Graphic Arts Consultant.

WOODCARVING. See WOOD CARVING.

WOODCHAT, wōōd'chāt, a name common both to an Asiatic bird of the thrush family (Turdidae) and to a European bird of the shrike family (Laniidae). The Asiatic woodchat is represented in the genera *Lanthia* and *Larvivora*, whose habitat is western Asia. The males are mostly bright blue but have red or rufous markings on the under parts. The European woodchat (sometimes called the woodchat shrike) belongs to the species *Lanius rutilus* (sometimes designated *L. senator*), whose habitat is southern Europe, where it appears in dry and open country, bushy commons, orchards, and olive groves. The woodchat is about seven inches long, its bill is hook tipped, its behavior is hawklike, and its song is musical, though interspersed with harsh notes. Though a rich chestnut-red color appears on the crown of the head and on the nape of the neck, both sexes are mostly black on the upper parts and white on the under parts and have some white on wings and tail.

DEAN AMADON.

WOODCHUCK, wōōd'chūk, or **GROUNDHOG**, ground'hōg, an American marmot (*Marmota monax*), 20 to 27 inches long, grizzled brown above and lighter below, the feet and tail blackish. It is found in the United States from the Atlantic coast to the Mississippi Valley (except in the Gulf states) and in Canada across the continent and as far north as Alaska, several distinct subspecies occurring in this wide range. Other related species of marmots are found west of the Rocky Mountains in North America, Europe, and Asia.

Woodchucks dig their holes in the fields, on sides of hills, or under rocks in the woods, in a slanting direction, at first upward to keep out the water, with several compartments, and usually

Woodchuck (*Marmota monax*)

John H. Gerard from National Audubon Society

with more than one entrance. Winter is passed in this burrow, in a dormant state. The digging is effected by the powerful forefeet, assisted by the front teeth, the dirt being thrown backward under the belly and then kicked out by the outspread hindfeet. The food of the woodchuck consists of various plants, fruits, and vegetables, clover being particularly favored. As a result, the animal sometimes does considerable damage to both crops and gardens.

Woodchucks feed chiefly during early morning and late afternoon, and spend most of the remaining time lying in the sun or sleeping in the nests at the bottom of their burrows. They become extremely fat (weighing up to 14 pounds in the autumn), retire to hibernate on the first intimation of winter (usually two to four marmots co-hibernate in one den), and reappear after the snow has gone in the spring, when they soon reduce to their normal weight of 8 or 9 pounds. The brood of young, numbering from 2 to 8, is born in the spring or early summer; they are forced to leave the burrow and to shift for themselves when a few months old. Woodchucks are playful creatures when young, but grow rapidly into slow-moving, heavy-bodied adults. The woodchuck, generally a bold and unsuspecting creature, has alert senses and, where much persecuted, may become extremely vigilant. When driven to bay, it can fight with considerable courage and effectiveness. Its chief natural enemies are foxes and bobcats, but the animal remains generally abundant in both cultivated regions and woodlands throughout its range.

KARL F. KOOPMAN

WOODCOCK, wōōd'kōk, a well-known American game bird (*Philohela minor*), belonging to the sandpiper family (Scolopacidae). The body is full and robust, the wings short and rounded, the head and eyes very large, and the bill straight tapering from the stout base, grooved for nearly the entire length, and exceedingly sensitive at the end. The legs are very short for a snipe. The woodcock is 10 or 12 inches long and weighs from 7 to 9 ounces, the female being the larger bird. The colors are a soft harmonious blend of various shades of brown and gray, with black mottling above and with a nearly uniform pale brown coloring below.

Habits.—The woodcock seldom ventures beyond the limits of the eastern half of the United States at any season, except to invade Ontario and other southern provinces of Canada. In winter it migrates to the South Atlantic and Gulf states, but mostly it breeds in the Central and Northern states. Migration northward begins very early, and many of the more hardy individuals reach the Middle Atlantic and New England states in early March before the frost has left the ground. At such times, and also in the late fall they secure their food, consisting of insects and their larvae and snails, by turning over fallen leaves; but during summer and whenever the ground is sufficiently soft, they probe it with their long sensitive bills and extract with great skill the earthworms which constitute their chief food. Even when the bill is plunged deeply into the earth, the large eyes, placed very high and forward on the head, permit unobstructed vision in all directions.

Woodcocks frequent bogs and swampy places along alder-grown streams and hillside springs

KARL H. MASLOWSKI, FROM NATIONAL AUDUBON SOCIETY

Woodcock (*Philohela minor*)

during summer; but in autumn they forsake these coverts for cornfields and undergrowth of low woods, the surest indication of their presence being their perforations in the soft earth. As the large size of the eye suggests, the woodcock is crepuscular and nocturnal. The period of its greatest activity is in the hours immediately succeeding sunset and preceding dawn, although, when the moon is full, it may be abroad throughout the night. During the day it remains hidden in deep bogs and thickets, rising only when frightened; then, springing perpendicularly above the bushes, it flies in an irregular course for a short distance and drops as suddenly to the ground.

In April or even earlier it builds a simple nest of leaves and grass in a dry, well-concealed spot in a bog and lays four buffy eggs spotted with dark brown and lilac. After incubation the fluffy brownish white chicks leave the nest at once, led away by the parent. The parent is very solicitous in the care of its young and not only feigns injury to entice an intruder from their vicinity but has been said to carry them, one by one, between its thighs to a place of safety.

The courtship flight of the male is curious and interesting. After a series of nasal *peents*, delivered with much apparent effort, he springs from the ground and mounts high in the air on whistling wings in a long circular flight. He then zigzags slowly earthward, each phase of the descent being accompanied by a series of clear and musical notes. This music is partly vocal in origin but in part is produced by the vibration of the air through the outer wing quills, which are stiff and narrow. The male bird then drops like a plummet to the exact spot from which he took wing. He is quite fearless when engaged in his courtship flights, which are repeated at short intervals and may be observed, even with the aid of a flashlight, without disturbing him. With the coming of hard frosts, most of the woodcocks leave for the South, and become concentrated in favorite bottoms along the lower Mississippi River area and other sections of the Gulf states.

The European woodcock (*Scolopax rusticola*) is similar to the American species, but is larger and is prominently barred below. It is found over a wide range from temperate Europe to

parts of Asia. Three additional but little-known, species of woodcocks are resident in the East Indies, in New Guinea and adjacent islands. The more remarkable of them is known only from the little island of Obi in the Moluccas.

DEAN AMADON,

Lamont Curator of Birds, The American Museum of Natural History, New York City.

WOODEN, John (1910–), American basketball coach, who led the University of California at Los Angeles (UCLA) to unequalled dominance in collegiate competition. From 1964 to 1975 his teams won the NCAA championship 10 times, including a record seven straight titles and a streak of 88 wins (1970–1974). During that span the UCLA Bruins amassed 282 wins against only 15 losses. An astute tactician, Wooden emphasized offensive finesse, with balanced scoring, and tenacious defense.

John Robert Wooden was born in Martinsville, Ind., on Oct. 14, 1910. At Purdue University he was named to the All-America basketball team in 1930–1932. A successful high school and small-college coach in Kentucky and Indiana, Wooden was appointed head coach at UCLA in 1948. Under his tutelage the Bruins gradually became a national power. Some of his players, such as Lew Alcindor (Kareem Abdul-Jabbar), Bill Walton, and Gail Goodrich, became outstanding professionals.

Wooden retired in 1975 after winning his 10th national title. He was the first person voted into the Basketball Hall of Fame as both a player and a coach.

HARVEY FROMMER

Coauthor of "Basketball My Way"

WOODFALL, a family of English printers and journalists:

HENRY WOODFALL: d. 1769. He was the publisher of the *Public Advertiser*, master of the Stationers' Company in 1766, and author of the ballad *Darby and Joan*, printed in the *Gentleman's Magazine* of March 1735, for which Woodfall's employer, John Darby, and his wife were said to be the models.

HENRY SAMPSON WOODFALL: b. London, England, June 21, 1739; d. there, Dec. 12, 1805. Son of the preceding, he took over management of the *Public Advertiser* from his father in 1758. Among its contributors was Sir Philip Francis, reputedly the author, during 1768–1772, of the famous *Letters of Junius* (see JUNIUS, LETTERS OF), attacking public characters of the day. Woodfall, however, is on record as stating that he definitely knew that Francis "never wrote a line of Junius" and that he had no personal acquaintance with the author of the letters. After the Junius letter to George III had appeared in the *Advertiser*, Woodfall was prosecuted by the crown for libel in 1770, but the verdict was practically one of acquittal. He published the letters in book form in 1772 and profited largely by their sale. He sold the *Advertiser* in 1793, and two years later it ceased publication. In 1797 he served as master of the Stationers' Company.

WILLIAM WOODFALL: b. 1746; d. London, England, Aug. 1, 1803. The younger brother of Henry Sampson Woodfall, he worked at first on the *Public Advertiser*, was editor of the *London Packet* from 1772 to 1774, and edited the *Morning Chronicle* from 1774 to 1789. In 1789 he established a daily newspaper, the *Diary*, in

which he published, for the first time, reports of parliamentary debates the day after they had taken place; he was compelled to write the reports from memory, since it was forbidden to take down debates in the House. He was also noted as a keen and sometimes truculent drama critic.

GEORGE WOODFALL: b. 1767; d. London, England, Dec. 22, 1844. Son of Henry Sampson Woodfall, he was a partner in his father's business until 1793 when the *Advertiser* was sold. He then carried on the printing trade at another location and became noted as a typographer. Perhaps his most famous piece of work was the edition of *Junius* (3 vols., 1812), including letters not previously collected or published. He also maintained that Sir Philip Francis did not write the letters, and their authorship was not divulged by him even to his son, Henry Dick Woodfall, who carried on the printing business after the death of his father.

ROSAMOND MUELLER.

WOODHULL, Victoria. See CLAFLIN, VICTORIA WOODHULL.

WOODIN, wōd'ōn, William Hartman, American industrialist and cabinet officer: b. Berwick, Pa., May 27, 1868; d. New York, N.Y., May 3, 1934. He attended the School of Mines of Columbia University and then worked in his father's foundry at Berwick, becoming general superintendent in 1892 and president in 1899. In the latter year he joined the American Car & Foundry Company, which he served as president from 1916 to 1922. He was also chairman of the board of the American Locomotive Company. Although previously a Republican in politics, Woodin supported Franklin D. Roosevelt's presidential campaign in 1932 and became secretary of the treasury in 1933, at a period when the country was in the throes of a severe banking and financial crisis. The successful efforts he made to restore public confidence led to a breakdown in his health and compelled him to resign his office at the year's end. Music was his avocation. Among his compositions are *Raggedy Ann's Sunny Songs*, pieces for children published in 1930, and the *Franklin Delano Roosevelt March*, which was played at Roosevelt's inauguration.

WOODLAND, wōd'ōlānd, city, California, seat of Yolo County, 18 miles northwest of Sacramento. The center of an agricultural region, it has a beet-sugar refinery, stockyards, feed mills, vegetable- and fruit-packing plants, rice and olive mills, and a plastics-manufacturing plant. Its Victorian buildings, in an excellent state of preservation, are of architectural and historical interest. Woodland Memorial Clinic Hospital is noted throughout northern California. Founded as Yolo City in 1855, the settlement was renamed Woodland because of the grove of oaks in which it stood. It was incorporated in 1871. Government by city manager and council was adopted in 1947. Population: 39,802.

RITCHIE D. THOMAS.

WOODMEN OF THE WORLD, a fraternal life insurance society in the western United States. It is a nonpolitical, nonsectarian organization with lodges, called camps, in the following states: California, Colorado, Idaho, Montana, Nevada, Oregon, Utah, Washington, and Wyoming. Its home office is in Denver, Colo. Membership is open to

men, women, and children, to whom all regular forms of life insurance certificates are issued. Adult and junior certificates in force total over 37,000.

DAN H. MILLER.

WOODMEN OF THE WORLD LIFE INSURANCE SOCIETY, a nonprofit fraternal life insurance society founded in 1890 in Omaha, Nebr., where its home office is still situated. The organization has over 4,000 camps (men's lodges) and courts (women's lodges) in 45 states of the United States, and almost 1,000 youth groups (Boys of Woodcraft clubs, Sportsmen's clubs, and Girls of Woodcraft courts). Besides providing life insurance at cost, the society has a varied social, recreational, and civic service program, including special awards to students to encourage the study of American history and other awards for community service and the conservation of natural resources. One of the society's special activities is to mark historic sites and place monuments to distinguished Americans. Adult and junior membership is about 500,000.

WOODMERE, wōd'mēr, unincorporated village, New York, in Nassau County, on Long Island, between Cedarhurst and Hewlett, in the Town of Hempstead. It is almost entirely residential; the majority of its gainfully employed residents commute to New York City. Woodmere is located on a bay of the Atlantic Ocean, and boating and fishing are favorite recreations. The village was originally called Brower's Point, after the Brower family, who were largely responsible for its settling. In 1868 the name was changed to Woodsburgh, in honor of Samuel Wood who purchased most of the property. The name Woodmere was adopted in 1875. Population: 15,578.

ELIZABETH W. THOMSON

WOODPECKER, wōd'pĕk-ər, a bird of the subfamily Picinae which is widely distributed in the forested regions of the world but lacking in Australia, Madagascar, and most of the islands of the Pacific Ocean. This subfamily consists of about 180 species and, together with its relatives the wrynecks (subfamily Jynaginae) and piculets (subfamily Picumninae), constitutes the family Picidae.

Wrynecks and Piculets.—The wrynecks and piculets are considered to be more primitive because they are less specialized for a life in the trees than the true woodpeckers. They differ from the latter in many respects, the most conspicuous being that the feathers of their tails are soft, their bills are much weaker, and, with one exception, they do not excavate their own nesting cavities. The wrynecks consist of only two species, one in Eurasia and the other in Africa, and are about six inches in size with a brown plumage speckled with white. Their curious name comes from their habit of contorting their necks at odd angles. See also WRYNECK.

The piculets are very small, varying from only three inches in size, or a little less, to about five. Most species are dull green, spotted with black in some cases. They inhabit subtropical or tropical regions and are best represented in the Americas, where there are 25 species ranging from the Antilles and Honduras south to northern Argentina; 3 species are Asiatic, and 1 is west African. They appear to be a very ancient bird group.

True Woodpeckers.—The true woodpeckers

(Picinae) are well characterized by their anatomy and mode of life. The texture of the tail is harsh, its feathers being stiffened by wirelike shafts. The bill is straight and very powerful; it is usually long and is always flattened laterally at the tip in the form of a chisel. The birds excavate their own nesting cavities by chiseling into a limb or the trunk of a tree, although one curious species, the ground woodpecker (*Geocolaptes olivaceus*) of South Africa, digs them into a bank in the earth. The tongue is very specialized for spearing or enmeshing their prey, which consists chiefly of insect grubs or ants. It is very long, extensible, provided with backward-pointing barbs at the tip, and coated in many species with a sticky substance. With it they probe deeply into narrow cavities in the wood or under the bark of trees or, in some species, in galleries in the ground frequented by ants. Only two of their toes face forward (a characteristic shared by the wrynecks and piculets); the fourth toe is directed backward or is missing. Their flight is undulating, and most woodpeckers climb vertically and upward, using the stiffened tail as a brace in climbing or when chiseling and hammering the trees.

The male does all or most of the excavating of the nest and shares with the female the incubation and rearing of the young. The eggs are pure white, the clutch varying from 6 to 9 eggs, which in most species hatch between 12 and 14 days.

Genera.—The best-known woodpeckers are those of the genus *Dendrocopos*, which numbers 35 species. These species, which inhabit the Old and the New World, have a pied black and white plumage, the male usually having some red patches on the head. They vary in size from about 4½ to 10 inches. The familiar hairy woodpecker (*D. villosus*) and its small relative, the downy woodpecker (*D. pubescens*), of North America are typical and are replaced by very similar species in Eurasia.

The flickers (genus *Colaptes*), which consist of six species restricted to the Americas, are much more colorful than the pied woodpeckers. Their plumage consists of various combinations of soft grays and browns, boldly banded or spotted with black; red is present also, and the rump is snow white. In addition, the wings and tail are golden in the yellow-shafted flicker (*C. auratus*) of eastern North America and red in its close relative (*C. cafer*) of western North America. The flickers are "aberrant" in the sense that they spend much of their time on the ground, digging for ants. Another very handsome American species, not closely related to the flickers however, is the red-headed woodpecker (*Melanerpes erythrocephalus*). Its whole head down to the upper breast is bright crimson, and the rest of its plumage is a bold combination of blue-black and snow white.

The green woodpeckers of the Old World, of the genus *Picus*, are another very distinct group, consisting of 15 species. The best known, the green woodpecker of Europe (*P. viridis*), is green above with a golden rump and, like the flickers, feeds much on the ground. The sapsuckers (*Sphyrapicus*) of North America are a small but also interesting group. The two species of this genus drill rows of shallow holes through the bark of trees and, as their name indicates, drink the exuding sap and also eat the insects that are attracted to it.

The most striking, and one of the largest, of all woodpeckers is the ivorybill (*Campephilus prin-*

Allan D. Cruickshank from National Audubon Society

Downy Woodpecker (*Dendrocopos pubescens*)

cipalis), which measures 20 inches and has a very bold black, white, and red plumage and an enormous yellow-white bill. A few pairs still live in western Cuba, but it is feared that it is now extinct in the United States, where it inhabited the primeval forest of the Southeast. Two related species inhabit Mexico and southern South America.

CHARLES VAURIE,

Associate Curator, Department of Ornithology,
The American Museum of Natural History,
New York City.

WOODRING, wōōd'ring, **Harry Hines**, American banker and political leader: b. Elk City, Kans., May 31, 1890; d. Topeka, Sept. 9, 1967. After 23 years in the banking business in Neodesha, Kans., interrupted by service in the U.S. Army Tank Corps in World War I, he sold his interests in 1929 and entered politics as a Democrat.

As governor, from 1931 to 1933, of usually Republican Kansas, Woodring opposed capital punishment, supported economies in government, and endeavored to reduce public utility rates. Woodring was unsuccessful in his bid for reelection in 1932, but as an early backer of Franklin D. Roosevelt's presidential candidacy, he was appointed assistant secretary of war by Roosevelt on April 6, 1933. After the death of Secretary of War George Henry Dern, Woodring succeeded to the cabinet post on Sept. 25, 1936. As secretary of war, he sought to strengthen the Army, particularly its air arm, and strongly urged American preparedness, but was opposed to involvement in distant conflicts. This position of non-intervention brought him into disagreement with certain policies of the Roosevelt administration after World War II started, and on June 20, 1940, he resigned from the cabinet. He subsequently engaged in politics in Kansas, running unsuccess-

fully for governor in 1946 and for the Democratic nomination for governor in 1956.

G. W. SCHULZ.

WOODRUFF, wōd'ruf, Wilford, American Mormon leader: b. Farmington (now Avon), Conn., March 1, 1807; d. San Francisco, Calif., Sept. 2, 1898. He adopted the Mormon faith in 1833 and soon was high in the church's councils, being made an apostle in 1839. Besides wide missionary travels in the United States, he went on two highly successful missions to England in the early 1840's. Woodruff was one of the advance party that first reached the valley of the Great Salt Lake in 1847 and was a leading member of the community in Utah from that time on. In 1880 he became president of the quorum of the Twelve Apostles of the Mormon Church, its second highest office, and in 1889 succeeded to the church presidency. In this capacity, in 1890, he proclaimed the end of plural marriage, which he himself had practiced. His journals, which have been published, are an important part of the early record of Mormonism.

WOODRUFF, wōd'ruf, a perennial plant, *Asperula odorata*, of the madder family (Rubiaceae), native to Eurasia and northern Africa, but naturalized elsewhere. Woodruff is pleasantly hay scented when it is dried. Because of this, it has been used to stuff pillows, to scent linens, and to flavor wine, and bundles of woodruff have been hung in homes and churches. In folk medicine, woodruff-leaf tea is prescribed for colds. Tea made from the dried flowers is a pleasant drink. Woodruff has slender, branched underground runners and four-angled stems that grow to 18 inches tall. Its elongate, pointed leaves have minute, forward-pointing prickles on the margin and are borne in widely separated whorls. The funnel-shaped flowers are white and fragrant and are grouped in long-stalked clusters. The small fruits are covered with hooked prickles.

JOHN W. THIERET.

WOODS, wōdz, **Robert Archey**, American settlement worker: b. Pittsburgh, Pa., Dec. 9, 1865; d. Boston, Mass., Feb. 18, 1925. He graduated from Amherst College in 1886 and then attended Andover Theological Seminary. After a year in England studying reform movements, he was placed in charge (1891) of Andover House (renamed South End House in 1895), the first settlement house in Boston, which he continued to direct for the rest of his life. Woods' early books on depressed areas in Boston, *The City Wilderness* (1898) and *Americans in Process* (1902), were the first studies of this kind and scope to be made in the United States. In 1911 he organized the National Federation of Settlements, serving as secretary until 1923 and as president thereafter. His basic concept that the neighborhood is the fundamental social unit is expounded in essays collected in *Neighborhood in Nation-Building* (1923). He also wrote an important history of settlement work in the United States, *The Settlement Horizon* (1922).

WOODS, William Burnham, American lawyer and justice of the Supreme Court: b. Newark, Ohio, Aug. 3, 1824; d. Washington, D.C., May 14, 1885. After graduating from Yale University in 1843, he was admitted to the Ohio bar in 1847 and from 1857 was a leader of the Democratic Party in the Ohio legislature. When the Civil War

began, he first opposed the policies of President Abraham Lincoln, but early in 1862 he joined the Union Army as a lieutenant colonel in the 76th Ohio Infantry, attaining the rank of brigadier general before his discharge in 1866. He took part in many of the major battles of the war, including Shiloh, Chickasaw, Arkansas Post, and Vicksburg, and accompanied Gen. William T. Sherman in his march to the sea. After the war, Woods identified himself with the Republicans and went to Alabama to aid in reconstruction. In 1869 he was appointed a United States circuit judge for Georgia and the neighboring states, and in 1880 he was named an associate justice of the United States Supreme Court by President Rutherford B. Hayes. He was noted for his ability to deal with complicated issues, among them the civil rights of the Negroes under the new amendments to the Constitution.

WOODS HOLE, village, Massachusetts, in the town of Falmouth (q.v.), in Barnstable County, situated at the southwest tip of Cape Cod, 16 miles southeast of New Bedford. A summer resort, Woods Hole has a good harbor, and boats go from here to Martha's Vineyard and Nantucket. The village is noted for the Woods Hole Oceanographic Institution, founded in 1930 and endowed by the Rockefeller Foundation. The institution has a permanent staff of scientists and maintains the research ship *Atlantis*. The Marine Biological Laboratory, which offers summer courses in marine biology, and a branch of the United States Bureau of Fisheries, which maintains laboratories, an aquarium, and fish hatcheries, are also located here.

WOODSON TERRACE, wōd'sən, city, Missouri, in northwestern St. Louis County, about nine miles from the city limits of St. Louis, adjoining the St. Louis Municipal Airport. It is primarily a residential community, with an aircraft company on its northern outskirts. Woodson Terrace was incorporated as a village in 1946 and as a city in 1954. It is governed by a mayor and board of aldermen. Between World War II and 1960 the population increased by almost 900 percent. Population: 4,362.

LORETTA HEINZELMAN.

WOODSTOCK, wōd'stōk, city, Illinois, McHenry County seat, 32 miles west of Waukegan. Situated in a dairy and farm area, it is the county's merchandising center and manufactures typewriters, beds, and metal products. Founded in 1844, the city was originally called Centerville because of its geographical position in McHenry County. In February 1845 the present name was adopted since a number of the residents came from Woodstock, Vt. Woodstock is built around a square at the head of which stands the courthouse. In the center of the square is a monument honoring the soldiers of the Civil War. The city was incorporated in 1852 and has the city manager form of government. Population: 14,353.

EDITH KNILANS.

WOODSTOCK, town, New Brunswick, Canada, seat of Carleton County, on the west bank of the St. John River, about 45 miles west-northwest of Fredericton. It is on the Trans-Canada Highway, has railway freight and express service, and, being near the Maine border, is one of the principal places of entry into the province from the United

States. Woodstock was founded by families loyal to Britain at the end of the American War of Independence. It is situated in a prosperous dairy-ing, mining, and farming region, the growing of potatoes being important. The vocational school here was the first in the province to offer courses in agriculture. Island Park is a picnic and recreational ground. Population: 4,649.

ALFRED G. BAILEY.

WOODSTOCK, city, Ontario, Canada, Oxford County seat, 80 miles west-southwest of Toronto, on the Thames River. Public schools include the modernly equipped Collegiate Institute; the Redemptorist Fathers' College also is here. The courthouse, occupying a commanding position, is noted for its architectural beauty. The city's chief industries are furniture and other wood products, stoves, garden implements, wire fences, pianos, organs, dairy products, and textiles. Pop. 26,603.

D. F. PUTNAM.

WOODSTOCK, a novel by Sir Walter Scott (q.v.), published in 1826. Though included in the Waverley series (see *WAVERLEY NOVELS*, THE), and originally conceived as a historical re-creation of life in Scotland, *Woodstock* is laid in England during the Cromwellian period. The novel covers the years 1651 to 1660, but the action focuses on the earlier part of the period, and its central concern is Charles II's escape from England disguised as a peasant. The action is a swift succession of dramatic episodes which, in keeping with Scott's aim as a historian, presents the reader not with actual facts but with the feeling of having lived through the early days of the Commonwealth. Scott is interested in the human spectacle, and thus he creates incidents relevant to this end. For example, we experience the emotions of Oliver Cromwell as he stands in Windsor Castle before the Van Dyck portrait of the king he has beheaded; or we relive with the protector his growing apprehension as Albert Lee upbraids him with the text: "Had Zimri peace who slew his master?"

Scott has the genius to make a place speak and tell its story. Perhaps from long association with the border country and its traditions he could invest a spot—in this novel Woodstock, a royal lodge—with a quality that makes the place seem right for the persons and customs from the past that cluster about it. As a result Scott's characters are not puppets: they are historically significant insofar as they are dramatically significant. Cromwell emerges, not as a documented figure, but as the human being he might have been: mystical, capable of self-deception, magnanimous, and great of spirit. The same is true of several other figures: Roger Wildrake, the Cavalier; Everard, the moderate who accepted Cromwell instead of anarchy; Desborough, the adventurer; Bletson, the agnostic; and Harrison, the opportunist.

DONALD B. CLARK,
Professor of English,
University of Missouri.

WOODSTOCK COLLEGE, a Roman Catholic theological institution in New York City. It was opened in Woodstock, Md., by the Jesuits for their own ecclesiastical students in 1869, when the papal charter for the faculties of philosophy and theology, originally granted to Georgetown University in 1833, was officially transferred to Woodstock. Since 1952, Woodstock has func-

tioned chiefly as a college of sacred theology. The regular four-year course leads to the degrees of bachelor of sacred theology or licentiate in sacred theology; the curriculum for the degree of doctor of sacred theology normally requires two further years. In 1969, Woodstock moved from rural Maryland to New York City. Enrollment is 250.

TERRENCE TOLAND, S.J.

WOODSWORTH, wōdz'wūth, James Shaver, Canadian humanitarian and political leader: b. Islington, Ontario, Canada, July 29, 1874; d. Vancouver, March 21, 1942. The son of a well-known Methodist home mission leader, James Woodsworth, he was educated in Canada and England and ordained a Methodist minister in 1900. His work in Canada took him to the western prairies, where he observed the problems of the New Canadians (recent immigrants from continental Europe); and he wrote several books, such as *The Strangers Within Our Gates* (1909), on this theme. Woodsworth's distrust of church dogma and his advanced social views, added to the pacifist stand that he took when World War I began, brought a break with the church in 1918. For a time he worked as a longshoreman in Vancouver, where he became deeply involved in labor organization. When a lecture tour took him to Winnipeg in May 1919, he was drawn into the general strike that paralyzed the life of the city, and he edited the strike bulletin until he was arrested on a charge of seditious libel, a charge which was later dropped.

Woodsworth won a seat as a Labour member of Parliament in 1921, representing Winnipeg North Centre, and he held this constituency until his death. In Parliament he worked tirelessly for a better social order; a notable example was in 1926, when he skillfully took advantage of a precarious government majority to win support for old-age pension legislation. As a socialist, he stood almost alone, but he won the esteem of the House for his conviction. He was a leading founder of the Co-operative Commonwealth Federation (q.v.) in 1932 and was chosen its first leader, but his relationship with the party was disrupted in 1939 when he left it to take a pacifist stand against involvement in World War II. He continued to hold his seat in Parliament until he suffered a stroke in 1941 and died shortly afterward.

JOHN H. ARCHER,
Legislative Librarian, Province of Saskatchewan Legislative Library.

WOODVILLE, wōd'vil or **WYDEVILLE**, wīd'vil, the name of an influential English landowning family, which was prominent in the 15th century. Some leading members of the Woodville family included:

RICHARD WOODVILLE, 1ST EARL RIVERS: d. Kenilworth, England, Aug. 12, 1469. He was the son of Richard Woodville, of the Mote, Maidstone, Kent, and Crafton, Northamptonshire. Like his father, with whom he is sometimes confused, he was a military commander in English-occupied areas of France; later he fought in the Wars of the Roses. In 1436 he secretly married Jacquetta of Luxembourg, widow of John of Lancaster, duke of Bedford, a son of Henry IV; the lady was fined £1,000 for marrying without royal permission. Woodville was created Baron Rivers in 1448 and Earl Rivers in 1466. He took part in

the suppression of Jack Cade's rebellion (1450) and in 1459 was appointed a commander at Sandwich, where he and his son Anthony were captured by the earl of Warwick's forces from France early in 1460. Rivers escaped, fought on the side of Henry VI at Towton (March 29, 1461), and accompanied the king on his flight to Newcastle. Later the same year, however, he switched his allegiance to Edward IV, who secretly married his daughter Elizabeth on May 1, 1464. The Woodville influence became dominant at court, arousing the jealousy of the older noble families. After Edward's defeat at Edgecot, near Banbury, Rivers and his son John were captured at Chepstow and executed.

ELIZABETH WOODVILLE (1437?-1492). See **ELIZABETH**, consort of Edward IV of England.

ANTHONY WOODVILLE, 2D EARL RIVERS: b. ?1442; d. Pontefract, England, June 25, 1483. Oldest son of Richard, he married Elizabeth, Baroness Scales in her own right, and was recognized as Lord Scales. In 1469, on his father's execution, he became Earl Rivers. He accompanied Edward IV on his flight to the Netherlands in 1470, returned to England with Edward in 1471, and in November 1473 became tutor to the young Prince Edward, of whom he had possession on Edward IV's death. Seized by Richard, duke of Gloucester (later Richard III), at Northampton on April 30, 1483, he was taken to Pontefract and executed. Woodville was a patron of William Caxton (q.v.), the printer, and translated from the French the first book that Caxton printed in England. He was also the author of various poems, now lost except for a touching lament presumably written just before his death.

LIONEL WOODVILLE: b. ?1446; d. 1484. Third son of Richard, he studied at Oxford and became bishop of Salisbury in 1482. He took a leading part in the rebellion against Richard III organized by the 2d duke of Buckingham, who had married Woodville's sister Catherine. When the rebellion failed, Woodville fled to Henry of Richmond (later Henry VII) in Brittany, where he probably died.

RICHARD E. WEBB,

Director, Reference and Library Division, British Information Services, New York City.

WOODWARD, wōōd'wōrd, **Calvin Milton**, American educator: b. near Fitchburg, Mass., Aug. 25, 1837; d. St. Louis, Mo., Jan. 12, 1914. Graduated from Harvard College in 1860, he was a high school principal in Newburyport, Mass., and served for a year as a captain of volunteers in the Civil War. In 1865 he was called to Washington University, in St. Louis, where he was dean of the polytechnic school (1870-1896) and of the school of engineering and architecture (1901-1910). In 1880 he pioneered in a new educational field by founding the St. Louis Manual Training School under the auspices of the university. As school director he inaugurated the plan of offering manual training courses, together with general education, to boys from 14 years of age, with the aim of discovering individual innate capacities. The experiment was immediately popular and spread to other cities. Woodward filled various other positions in the educational field with distinction, including the presidency of the University of Missouri (1894-1897). His publications included *The Manual Training School* (1887), *Manual Training in Education* (1890), and *Rational and Applied Mechanics* (1912).

WOODWARD, city, Oklahoma, seat of Woodward County, located about 85 miles west of Enid on the North Canadian River. Lying in a fertile farming and ranching area, the city is a market and processing center for wheat and cattle, with oil and gas fields in the vicinity. A United States agricultural experiment station is located in the city; Boiling Springs State Park and Alabaster Caverns State Park are nearby. The city was founded at noon on Sept. 16, 1893, with the opening of the Cherokee Strip to white settlement, and was named for Brinton W. Woodward, director of the Atchison, Topeka and Santa Fe Railway. It is governed by a manager and three-man commission. Pop. 13,610.

ROBERT E. LEE.

WOODWAXEN or **WOADWAXEN**, wōōd'wāk-sən (also known as **DYER'S GREENWEED**), an upright or sprawling shrub, *Genista tinctoria*, of the legume family (Leguminosae), native to Eurasia. It is sometimes grown as an ornamental shrub and has become naturalized in parts of the United States. At one time, in England, a green dye was made by mixing woad (a blue dye) with the yellow dye obtained from woodwaxen. A tea made from woodwaxen has been used in folk medicine as a purgative and diuretic. Woodwaxen grows from a few inches to 3 feet tall and has lanceolate, stalkless leaves up to 1½ inches long, which may have a fringe of small hairs on the margin; yellow, pealike flowers borne in clusters that terminate the branches; and small flat pods.

JOHN W. THIERET.

WOODWORKING, wōōd'wŭrk-īng, in the most general sense, any activity involving the working or shaping of objects of wood. Originally the term referred only to making interior fittings of wood, such as moldings and stairways, but now it is generally used to include carpentry, joinery, cabinetmaking, millworking, and furniture manufacturing. Closely allied are such occupational areas as upholstering, furniture finishing, and painting.

HISTORICAL DEVELOPMENT

Prehistoric and Primitive Times.—The history of woodworking begins with early man. Possibly the first woodworking tool was fire, which prehistoric man undoubtedly used to hollow out logs; these were then scraped with shells or rocks to remove the charred wood, and were fashioned into rude canoes. Other primitive boats consisted of logs fastened together to make rafts. Later these were developed into sturdy sea-going vessels, which were constructed with good proportion and sound workmanship.

After the savage era, man continued to use wood, combining it with newer discoveries, and the original materials of stone, bone, ivory, and wood were used with bronze and iron. Primitive looms were made from branches of trees. Bows and arrow shafts were of wood. The American Indians undoubtedly used wooden utensils and weapons more than 10,000 years ago, but the wood disintegrated, and traces of the exact nature of the items have vanished. Aborigines of Australia and New Zealand had no bows or arrows, and their boats were of the crudest character, but they used wood for weapons such as the boomerang, blowpipe, and bola. The sling and throwing stick were unknown. The spear, which is a development of the knife point, and the club,

which is a long hammer, were the only natural and universal weapons of man.

Builders of the Neolithic lake dwellings in Switzerland, France, and Italy cultivated land crudely, and cereals were in cultivation before the Bronze Age. This was possible because primitive man tilled the land with wooden tools which had the shape of gouges and were used as spades. The dirt clods were beaten and broken by pieces of wood also. The hoe was an oyster or tortoise shell fixed on the end of a stick.

Remnants of lake dwellings preserved in peat moss deposits at the bottom of Lake Geneva reveal ancient wooden piles on which the huts were set. Implements of wood have also been found there. All of these would have disintegrated if left in open water. Dwellers in caves ground their cereals with stones in wooden troughs. The potter's wheel, known in China from very early times, is shown in wall paintings dating 19 or 20 centuries before Christ. All this points to a remarkable achievement in woodworking and its bearing on the development of the crafts.

In the centuries that followed, woodworking was developed to a high degree in all the centers of civilization, from the Far East and India to the Mediterranean basin. Ships and land vehicles were made basically of this material, and weapons, tools, domestic furniture, and ornaments bear witness to the skill of the craftsmen.

Medieval Europe.—In medieval times the misery of the peasants was heightened by the fact that wooden items were extremely valuable. Interesting to note is that beds on which they brought their dead to the churches were confiscated by the clergy. The forests were valuable, and the supply of wood to which the peasants were entitled was strictly limited. Wood was used in huts, and in Chaucer's time in England one reads of decrepit hovels with rotten beams and half-ruined walls. At first forests were so dense that workers were impressed to clear them. Later, as populations increased and wood was in greater demand, persons cutting trees illegally were cruelly prosecuted. Utilitarian products of medieval woodworking included such things as carts, plows, barrows, cider presses, kneading troughs, baskets, chests, spades, axes, forks, chairs, tables, and beds. There was also much fine use of wood for artistic purposes.

Guilds and Craftsmen.—The carpenter, according to J. Malet Lambert in *Two Thousand Years of Guild Life* (1891), was originally one who made the "carpent" or heavy covered carriage or cart. From this the meaning of the term was extended to include any craftsman who made heavy woodwork, such as timbers of houses and roofs. The joiner worked on doors and smaller kinds of woodwork. A third class was the shipwright.

The hereditary smith or carpenter existed long before their crafts were organized into guilds, which presupposed a considerable development of town and industrial life. According to some authorities, guilds were founded in England as early as 856 A.D. From the 12th century onward, the craftsmen of a trade, when they became numerous, formed themselves into a fraternity along the same lines as the older guild system, with the privilege of monopoly and the power of enforcing regulations. Guilds for woodworkers thrived in the Middle Ages; in England, the Fraternity of Carpenters, formed around 1308, was a powerful one. From the end of the 13th century, apprentices there had been bound as pupils to

skilled workmen for a fixed period of time, which by 1647 was eight years and later was shortened to seven.

Colonial America.—Wood was the only basic material available to the American colonists at first; from it they had to make all the necessary everyday utensils and tools. Until metal was processed, items such as bowls, plates, buckets, tools, paddles, ladles, and drinking mugs were fashioned in simple, useful design from wood by woodworkers. Early furniture was of sturdy wooden construction. Even clocks had many moving parts made from wood.

As colonial society became more sophisticated, craftsmanship progressed from strictly utilitarian concepts to a concern for beauty of line and attractiveness of design. In the era prior to 1750 the Colonial style of design emerged; from 1750 to 1775, the Pre-Revolutionary. Fine furniture was imported from England, and the great craftsman Thomas Chippendale strongly influenced American design. The Post-Revolutionary period after 1800 was influenced by such great woodworkers as George Hepplewhite and Thomas Sheraton, with some French Empire semblance. The first American furniture designer and woodworker of note was a Scotsman named Duncan Phyfe, who lived and had his factory in New York City in the early part of the 19th century. The Duncan Phyfe designs have balance, structural soundness, and economy of construction.

Modern Woodworking Concepts.—The major contribution to furniture making in the 19th century was the development of woodworking machinery and the introduction of machine-made furniture. This accounts for the enormous quantity of furniture manufactured at relatively low cost.

Woodworkers of the 20th century developed "modern" design. This includes designing pieces to fit their purposes, that is, functionalism; and avoidance of excess bulk of line and the use of minimum materials. Functionalism plus beauty is the essence of good modern design. The trend in woodworking today is toward revival of the English Regency, German Biedermeier, and French Directoire styles, while the Danish, Oriental, and International Modern styles also occupy places of importance. The traditional styles take on a new look through a blending of the best from each period.

MAJOR FOREST REGIONS

United States.—Lumber used in woodworking depends upon sources and availability. There are six commercial forests in the United States (excepting Alaska and Hawaii), from which timber is harvested and lumber is processed.

Pacific or West Coast Forest.—This area extends along the moist western slopes of Washington, Oregon, and northern California. The lumber obtained in Washington and Oregon is mostly Douglas fir (*Pseudotsuga taxifolia*); western hemlock (*Tsuga heterophylla*), western red cedar (*Juniperus scopulorum*), and Sitka spruce (*Picea sitchensis*) are also found. In northern California the characteristic wood comes from the redwood trees (*Sequoia sempervirens*), which are among the world's largest. The West Coast Forest comprises well over 28 million acres and represents more than 550 billion board feet of timber. Less than 4 billion board feet are in hardwoods.

Western Forest.—This forest includes portions of the 12 Western states covering about 35 percent of the continental United States. Nearly

100 million acres are considered commercial forest lands, from which are obtained 500 billion board feet of softwoods. These are chiefly western white pine (*Pinus monticola*), sugar pines, and some hardwoods.

Northern Forest.—Situating along the northern Great Lakes and in the northeastern part of the United States, this commercial forest section comprises more than 132 million acres which contain more than 62 billion board feet of softwoods and over 108 billion feet of hardwoods. The chief species are white pine (*Pinus strobus*), red spruce (*Picea rubra*), eastern hemlock (*Tsuga canadensis*), and other conifers, as well as hardwoods such as red oak (*Quercus rubra*), and white ash (*Fraxinus americana*).

Central Hardwood Forest.—Mostly hardwoods, covering over 47 million acres, grow in this forest area through the central eastern section of the United States. The yield is 46 billion board feet of hardwoods, including black walnut (*Juglans nigra*) and white oak (*Quercus alba*). Nearly 3 billion board feet of softwoods are also included. These are poplar (*Populus deltoides*) and sweet or red gum (*Liquidambar styraciflua*).

Southern Forest.—This forest stretches from Virginia through eastern Texas, and from Oklahoma to the Gulf of Mexico. There are over 183 million acres which produce nearly 194 billion board feet of hardwoods and softwoods. Growing here are black walnut (*Juglans nigra*), sugar maple (*Acer saccharum*), white ash (*Fraxinus americana*), bald cypress (*Taxodium distichum*), Georgia pine (*Pinus palustris*), poplar (*Populus deltoides*), and shortleaf pine (*Pinus echinata*).

Tropical Forest.—This forest grows in a very small area of the tips of southern Florida and Texas. Palm trees and some ebony trees are found here.

Other Countries.—In many other areas of the world fine forests yield many beautiful and exotic woods. These include African mahogany (*Khaya ivorensis*), and the New World mahoganies (*Swietenia mahagoni*), which come from the West Indies, Mexico, Central America, Colombia, Venezuela, and the upper Amazonian region. Both African and Central American mahoganies are used by the woodworker in making exquisite furniture. There are numerous other foreign mahoganies, but they are not extensively used by the woodworker or cabinetmaker because of the cost.

Philippine mahoganies originate in the Philippine Islands and belong to the plant family Dipterocarpaceae. These woods are varied in color and texture, but they are in no way, botanically or otherwise, related to the true or classical mahoganies. They are technically referred to as red or white lauans and are of a much coarser texture than the true mahoganies. Their grain in the form of quartered, sliced, and rotary cuts produces a lumber which is very pleasing for furniture, cabinetwork and millwork, and interior wall paneling. Other precious, rare, and expensive woods are often cut and sliced for veneering, to use on panels, marquetry work, and inlaying.

HAND-TOOL PROCESSES AND HAND TOOLS

A woodcraftsman must be an artist in working with hand tools. In making anything from wood certain basic hand-tool processes must be performed well. Some of these processes and the

hand tools required are discussed in the following paragraphs.

The evolution of the hand tool is shown in Fig. 1. Illustrated are several old woodworking tools partly made of wood, with their present-day counterparts made of metal. This transition has occurred during the past century.

Fig. 1. Colonial period plane, brace, and screwdriver compared with modern counterparts.

Measuring and Laying Out Lumber.—This process involves laying out lengths, widths, thicknesses, lines, and angles. Practically all measuring tools used in woodworking have a scale divided into inches, half inches, quarters, eighths, and sixteenths. The tools more commonly used for measuring and laying out are the 1- or 2-foot steel or wooden rule, steel square, try square, zigzag rule, flexible steel rule or tape, T bevel, marking gage, and marking knife.

Sawing Across or with the Grain (Fiber) of Wood.—After the lumber or boards have been accurately measured and marked, they must be cut. The hand process requires the use of the steel-bladed handsaw. The more common woodworkers' saws for this purpose are the crosscut saw, rip saw, and the backsaw or cabinet saw. The number of points per inch makes the coarseness or fineness of a saw. There is always one more point per inch than there are teeth on the saw blade. For instance, a saw with eight points per inch will have seven teeth per inch. A coarse saw is better for doing fast work and for cutting green (undried) lumber. A fine one does smoother, more accurate cutting on seasoned (dry) wood. The crosscut saw is used to cut across the grain of the wood, and the rip saw is used for ripping or cutting with the grain. A saw cut is known as the kerf.

Planing Lumber.—Planing boards by hand often involves the process of squaring stock. This

is a basic procedure in which there are definite steps for planing the surfaces, edges, and ends of each board. The board has been squared when the surfaces are parallel to each other and when the edges and ends are 90 degrees to the surfaces and to each other. The sequence of steps for squaring a board are (1) the face or first surface, (2) the first edge, (3) the first end, (4) the opposite end, (5) the opposite edge, and (6) the last face or surface. The tools used in planing and/or squaring lumber are the jack plane, try square, framing square, marking gage, rule, crosscut saw, rip saw, and backsaw. Some of the more common planes used by the woodworker are the jack, smoothing, jointer, block, and rabbit planes.

Shaping Chamfers and Bevels.—A chamfer is a means of decorating an edge. A bevel may be either an edge treatment or a way to fit two boards together at an angle. The chamfer is usually planed to a 45-degree angle, while the bevel may be at any angle. Tools generally used for making either of these forms are a jack plane or a block plane. A sliding T bevel tests the angles.

Laying Out Irregular Pieces and Curves.—Woodworking is concerned with laying out, cutting, and forming (shaping) irregular cuts and curves on boards. This includes laying out a hexagon, an octagon, and an ellipse, and irregular markings for cutting and forming. Tools needed for laying out are dividers, trammel points, rule, and french curve. Cutting and forming tools consist of coping and turning saws, spokeshave, drawknife, wood or cabinet files, and surface- and edge-forming tools.

Cutting and Trimming with a Chisel.—Accurate cutting, fitting, shaping, and surface decorating are done with sharp woodworking chisels. Various types of these tools are used for horizontal, vertical, and curved chiseling, as well as for grooving with gouges. Wood chisels are generally classified as socket and tang chisels. Gouges are chisels used for grooving, shaping edges, and model making. Flat wood chisels and gouges have beveled cutting edges. Often a wooden or fiber mallet is used to give added driving pressure.

Smoothing with a Scraper.—Frequently surfaces and edges of a board must be scraped, particularly if the grain is burly or knotty. Hand scrapers are either straightedged or curved (swan neck). Straightedged or swan neck scraper blades are usually used by hand. The straightedged blade may also be fastened in a specially built holder for pushing or pulling. These are known as cabinet, pull, or box scrapers.

Boring and Drilling Holes.—Holes are bored or drilled in wood for screws, bolts, dowels, inside sawing, and ornamentation. Types of bits used for boring or drilling include the auger, twist drill, iron drill, gimlet, expansive bit, Forstner bit, straight-shank drill, and automatic drill. Tools for holding bits are a brace, hand drill, and automatic drill. A depth gage is used to control depth of drilling.

Fastening with Screws.—Screws are used to fasten boards and assemble woodworking projects. An advantage in using them is that a project can easily be taken apart and reassembled. The three most common types of screws for joining wood are the round-head, flat-head, and oval-head screws. Wood screws have single slotted heads, or Phillips-heads (cross slots). Tools used in driving screws are the screwdriver which will fit the

top of the screw, and bits for boring or drilling holes. A countersink bit is often used to recess the head of flat-head and oval-head screws.

Driving and Pulling Nails.—Nails are often used in assembling wooden projects and for carpentry construction, but they are used very sparingly in furniture building. The kinds most frequently used in woodworking are the box, common, finishing, brad, and casing nails. The size of nails is usually indicated by the term "penny" or its abbreviation "d." It is believed that these terms are derived from the weight of 1,000 nails; 1,000 10-penny nails weigh 10 pounds. Claw hammers with heads of different weights and nail sets of various sizes are the only essential tools.

Gluing and Clamping.—Boards are glued together edge-to-edge to make larger surfaces, or face-to-face to increase thickness. When they are properly made and the glue is prepared and applied correctly, glued joints are as strong as the wood, and in most cases, stronger. The classifications of glues used in woodworking are animal, casein, plastic resin, polyvinyl resin, resorcinol resin, and fish glues. Minor types include blood albumen, starch, all-purpose cements, and adhesives. Three types of clamps commonly used are the cabinet or bar clamp, hand-screw clamp, and C clamp.

Preparing for Finishing.—Furniture and cabinetwork should be thoroughly smoothed before a finish is applied. Furniture should have all traces of electric planer or mill marks removed by scraping and sanding. Cabinetwork and interior wood trim often retain mill marks, but should be thoroughly sanded. There are three natural abrasive materials used on wood. These are available as sandpaper, garnet paper, and emery cloth. The grit classifications range from extra fine to extra coarse.

POWER-TOOL PROCESSES AND MACHINE TOOLS

Stationary machine tools used in woodworking are classified as industrial (Fig. 2), heavy, and

Fig. 2. A Delta multiple-spindle industrial drill press setup. This unit must be anchored.

lightweight (Fig. 3). The first two, must be leveled and fastened securely to suitable

footings. Lightweight machine tools are used where it is necessary to move them frequently, as in school industrial-arts laboratories, vocational industrial shops, in home and other building construction by contractors, and by the home craftsman.

Fig. 3. Operating a Delta lightweight, moveable 10-inch circular school-type saw.

For industrial and school use, woodworking machines are of the unit type, such as circular saws, planers, and jointers, rather than of the multipurpose type used by home craftsmen. The home craftsman or hobbyist often prefers a machine on which he can saw, plane, drill or bore holes, and sometimes sand. See Fig. 4.

Fig. 4. This Deltashop home craftsman all-purpose machine can be used for a variety of projects.

Portable electric power tools (Fig. 5) are commonly used by builders, schools, and the home craftsman. The most satisfactory portable power tools use available electric power in industry, schools, and homes. The home craftsman also has available to him power tools which obtain their electric power from the batteries of automobiles or from power packs which can be carried. The power-tool processes described in the following paragraphs are the more common ones used in woodworking.

Fig. 5. A Porter-Cable portable electric orbital sander.

Sawing with the Circular Portable Electric Handsaw.—The circular or table saw can do many complex operations, such as ripping, cross-cutting, dadoing, and shaping. Blades and cutters are available for many processes. This machine has some limitations because it is portable and is manipulated by hand; but fitted with proper blades or abrasive disks, it can be used to cut lumber, ceramics, slate, marble, tile, nonferrous metals, Transite, corrugated galvanized sheet, and almost any kind of building material.

Sawing on the Radial Saw.—This is a development from the old type of swing saw in which the saw blade swung back and forth above a worktable. The modern radial saw is a precision machine which has many adjustments and numerous accessories to crosscut, rip, miter, bevel, make tenons, and cut dados, rabbets, grooves, and tongues. It will also do molding and router shaping, as well as drill, sand, and grind.

Sawing on the Band Saw.—This machine can be used for crosscutting, ripping, and cutting curved pieces. The logging industry uses huge band saws for ripping logs into boards of various thicknesses.

Sawing on the Scroll and the Portable Jig saw.—The scroll saw is stationary. The portable jigsaw is an electric tool manipulated by hand. Both will cut either internal or external curves, in addition to straight sawing.

Planing.—There are planers known as thickness planers or surfacers, and jointers. There are also electric hand-operated planes for edge planing. Planers vary from the home craftsman's sim-

ple, small edge jointers to heavy, complex industrial machines which plane to thicknesses of close tolerances.

Boring and Drilling Holes.—Holes can be bored and drilled with portable electric drills and drill presses. Industrially, the latter often become complex multiunits which are powered automatically. (See Fig. 2.) Drill presses have adapters and accessories to do many additional operations in woodworking, such as mortising, shaping, routing, and sanding.

Shaping.—The woodworking shaper is used for shaping straight or curved edges, making molding, and pattern shaping. It may also be used for fluting furniture legs. Shapers have adjustments and molding cutters, or knives, to fit and make any shape of edge design. Hand-operated electric routers are developed to do practically anything that can be performed on a pedestal-type shaper.

Wood Turning.—The wood lathe is one of the oldest types of power equipment known, used to fashion wooden objects. The basic processes performed on the lathe consist of turning between live and dead centers, and turning on a faceplate.

Tools used for cutting can be as varied as the designs dictate. Five of the more common woodworking turning tools are the gouge, skew chisel, parting tool, round nose, and diamond point.

Sanding.—Sanding furniture and cabinetwork is best done with power sanders. The equipment varies from heavy base-anchored floor-model sanders, with large sanding belts, to hand-operated portable belt sanders. Other power sanding equipment commonly used is the hand-operated orbital sander and the disk sander. There are variations of all of these types.

JOINERY

Joinery evolved as the craft of a skilled woodworker who did the work necessary for the finishing of buildings. Later, it was applied also to furniture. As noted previously, during the Middle Ages the joiners were a separate craft and guild, as were the carpenters and shipwrights.

In the paragraphs that follow, a number of basic joints are described. Fig. 6 shows a few of the more common ones. Each has special applications and adaptations suited for particular construction needs.

Butt Joint and Doweled Joint.—The edge-butt and end-butt joints are two types used frequently. The end-butt joint is assembled and fastened securely with nails, screws, or corner blocks. The edge-butt joint is most often held together with glue; however, corrugated and other types of fasteners may be used sometimes. Wooden dowels are often used to reinforce edge-butt, end-butt, and mortise-and-tenon joints.

Dado Joint.—The dado joint is one of the strongest when properly made. A groove is cut across the grain of a piece of wood, and another piece is fitted into it. These joints are used in drawers, shelves, bookcases, and stepladders.

Rabbit Joint.—The rabbit joint is similar to the dado, except that the pieces are joined together at the ends. This joint is ideal for certain types of corner construction.

Lap Joint.—There are several kinds of lap and notched joints. One of the more common for carpentry and furniture making is the cross-lap joint. Another is the end-lap joint.

Tongue-and-Groove Joint.—This is an adaptation of the edge-butt joint in which a tongue, groove, or rabbit is cut in both pieces to make a

firm fit. A common application of this type of joint is in flooring.

Spline Joint.—A spline joint may be applied to a miter or an edge-butt joint. It consists of fitting a piece of wood called a spline into grooves of both parts of the joint to give it rigidity, as well as to make it invisible in some cases.

Dovetail Joint.—This joint has wedge-shaped fingers cut on the end of one piece of wood which fit into matched socket cuts in the other piece. It can be either a true dovetail or a stop dovetail joint. The latter is commercially used in better drawer construction. The electric router with a special jig or attachment will make a precision dovetail joint.

Fig. 6. Some basic joints used in woodworking: (A) butt, (B) rabbit, (C) dado, (D) doweled-butt, (E) cross-lap, (F) middle-lap, (G) splined miter, and (H) doweled-edge.

Mortise-and-Tenon Joint.—An accurately made tenon on the end of one piece of wood fits into a mortise cut in the second piece to form this joint. Five of the more popular types of mortise-and-tenon joints are the through, blind, haunched, stub, and miter joints.

FINISHING WOOD

Wood finishing can be a highly developed skill, and many woodworkers have developed this specialty into an art and a career. Finishes are applied on wood surfaces to serve as a protection, preserve the wood, bring out the beauty of the grain, and also to give ornamental effects. Finishing materials to produce such effects include stains,

bleaches, wood filler, shellac, varnish, sealer, lacquer, synthetics, paint, and enamel.

Equipment and materials used in putting on finishes are brushes, spraying equipment, rubbing abrasive paper, linseed oil, turpentine, alcohol, lacquer thinner, synthetic thinning agents, steel wool, pumice stone, rottenstone, commercial rubbing compounds, rubbing oil, and wax.

Staining.—Stain is put on wood to produce a desired color effect, yet preserve the grain pattern of the board. Considerable manufactured furniture is made from relatively inexpensive woods, then stained to resemble such exquisite ones as walnut and mahogany. Oil, water, and spirit are the bases of three widely used stains.

Wood Filler.—This material comes in liquid or paste form. It is used to fill the pores of open-grain wood to produce a smooth surface, over which the final finish may be applied. Paste wood filler is made from silex, a ground silicon, which is mixed with linseed oil, japan drier, and turpentine. Filler is usually mixed with colors in oil to secure the tint desired for the final finish.

Bleach.—Bleaching is the process of removing the natural color from the surface of wood. This finish is sometimes referred to as blonde, limed, or wheat. Commercial bleaches are prepared as one- or two-solution liquids.

Shellac.—One of the oldest finishing materials, used since the 16th century, is shellac. It is the product of the lac insect (q.v.), found in the East Indies and southern Asia. This insect feeds on a resinous material and then leaves a secretion on the tree limbs. After several generations of insects, the secretion forms a coating. This is stripped off by hand and separated from impurities, such as twigs and other foreign matter. It is then heated, strained, and processed into sheets, which later are further refined and dissolved in denatured alcohol to form liquid shellac.

Shellac produces a good finish. It is easily applied, dries rapidly, and rubs out smoothly to make a fairly hard surface. It is not waterproof and, because of this, often serves as a sealer coat for waterproof finishes. It is obtainable in two colors, white and orange. These are the same, except that white shellac has been bleached. Orange shellac is most often used as a primer for painting and for finishing in pattern making.

Varnish.—Varnish preserves wood finishes. It can be rubbed with pumice or rottenstone and water and oil to give a beautiful luster. Originally all good varnishes were made from imported fossil gum; more recently, however, synthetic resins have replaced the original basic material. Varnish is available in either transparent or colored forms to make varnish stain.

Varnish stains are sometimes used by the inexperienced woodworker because they give a quick color to a varnished surface. They are generally not suitable for fine, finished furniture, however, because the stain tends to blur the natural grain of the wood. Spar quick-drying varnish is very popular because it is tough, waterproof, and heat resistant.

Lacquer.—This material is ideal for finishing furniture. It dries quickly so that successive coats may be put on in a few hours. Lacquer is available clear or in a wide variety of colors. True lacquer was used in China as far back as 3,000 B.C. Eastern lacquer is the natural sap of the lac tree. No other substance, except perhaps a coloring agent and a thinner, is normally added to the natural juice.

Paint and Enamel.—Paint and enamel provide protective and decorative coatings for less expensive woods, where a transparent finish may not be desirable. Either can be used satisfactorily as a colorful finish on furniture, cabinets, and interior trim. Paint is generally applied to exterior surfaces or on woods which are exposed out of doors. Enamel is most suitable for interior trim within the home. It usually produces a harder finish than paint, because it contains varnish.

Penetrating or Wipe-on Wood Finishes.—These finishes are very popular since they can be applied easily by the home craftsman or the novice in woodworking. Many interesting effects can be obtained according to the intensity of application and the pressure exerted in wiping. These finishes can serve as staining or coloring agents, as well as basic sealers. Clear finishing materials are often used for the final applications for primer pigmented wipe-on coats. Beautiful furniture, interior trim, and wall panels are often treated with these finishes.

WOODWORTH, wood'wüth, George Wallace, American music educator: b. Boston, Mass., Nov. 6, 1902; d. Cambridge, Mass., July 18, 1969. He studied music at Harvard and the Royal College of Music in London and taught at Harvard from 1925, becoming a professor in 1948. He conducted the Radcliffe Choral Society from 1925 and the Harvard Glee Club from 1934, and was organist of Harvard and choirmaster of the Harvard Chapel from 1940. He held all of these positions until his retirement in 1958. National and international tours by his choruses brought him wide renown. His book *The World of Music* was published in 1964.

HERBERT WEINSTOCK

WOODWORTH, Robert Sessions, American psychologist: b. Belchertown, Mass., Oct. 17, 1869; d. New York, N.Y., July 4, 1962. He studied at Amherst and Harvard, and took the doctorate in psychology at Columbia in 1899. After three years of teaching physiology in New York City hospitals and a year of study with Charles S. Sherrington at Liverpool, England, he joined (1903) the faculty of Columbia, where he was professor of psychology until 1942 and continued to lecture until 1958. At Columbia he supervised the doctoral studies of many who came to occupy major positions in American universities.

Woodworth's first important research publication, undertaken with Edward L. Thorndike, was a vigorous attack on the concept of generalization

GEORG GENSTER/PHOTO RESEARCHERS

In Australia sheep are raised in large flocks, often on poor land not suited for agriculture. Modern shepherds use motorcycles and four-wheel-drive vehicles to travel with the flock as the sheep graze on the open land.

in learning. Transfer of training, they held, occurs only when the learner perceives identical elements between skills or ideational material formerly acquired and the new material to be mastered. In 1911 he revised and extended a famous textbook on physiological psychology originally written by George T. Ladd. His *Experimental Psychology*, long used in mimeographed version by scores of graduate students, appeared in 1938. Revised by Harold Schlosberg in 1954, it remains one of the most important handbooks of experimental psychology in the English language. His textbook *Psychology* (1921), written for beginning students, though by no means comparable to William James' basic textbook, became one of the best sellers in its field.

Woodworth believed that Edward B. Titchener and John B. Watson were especially mistaken in their theories and procedures. William McDougall he regarded as too metaphysical. Psychology, Woodworth taught, should concentrate on functions or activities, both mental and physiological. The handicaps of language must be surmounted, and the nouns customarily used in psychology ought to be thought of as verbals. Thus, it is incorrect to say that a person has high intelligence. The sentence really means that the person behaves very intelligently. Likewise, "memory" does not exist as an entity but rather connotes such functions or activities as learning, retaining, recalling, and recognizing.

WOOF or WEFT. See **WEAVING, HAND LOOM; TAPESTRY—Technique.**

WOOL, the animal fiber forming the protective covering of the sheep, usually white in color, though the degree of whiteness may vary considerably. It may be also creamy yellow, gray, brown, or black, but there is no noticeable difference in structure or properties between wool of these colors and white wool. The outside of the wool fiber is made up of flat, irregular scales that overlap like roof shingles. The fiber grows with a crimp—a wavy form which gives excellent properties of elasticity and resilience. Some of the individual fibers are short, others long; some are fine, others coarse. Basically, length and fineness determine the purpose for which the fibers can best be used.

Chemically, wool is a protein called keratin and is made up of about 18 different amino acids, which are linked to one another to form long, coiled molecular chains, shaped somewhat like a coiled spring. Individual chains are linked to each other by chemical (disulphide) cross-links. Branching off the chains are reactive chemical sites (side groups of some amino acids). The molecular chains uncoil when wool fibers are stretched or distorted, but tend to assume their original shape when the stretch force is removed. Wool fabrics, as a result, shed wrinkles easily and are long wearing because of the unique elasticity of the wool protein. The reactive side groups are easily modified by chemicals to give new wool properties, and they also readily attract dyestuffs.

Woolgrowing. The domesticated sheep is raised in virtually every country of the world, in several hundred varieties, differing in appearance and in the type of wool produced. These variations result from differences in soil, climate, pas-

An expert can shear a sheep quickly, cleanly, and with no pain to the animal. A freshly shorn sheep is seen against the fence.

turage, and breed. No two fleeces, even from the same type of sheep and the same geographic area, are exactly alike. There are, however, three major types of sheep: (1) mutton types, raised primarily for meat; (2) wool types, raised principally for wool; and (3) dual types, raised for both meat and wool.

Most sheep are raised either on large ranches, where they constitute the principal profit-making product, or on small farms with diversified crops and livestock. The first type of enterprise prevails in Australia, New Zealand, South America, and the western United States; the second type in the midwestern United States, England, and continental Europe. In addition, large numbers of sheep are raised under primitive conditions in remote mountain districts, such as the Highlands of Scotland, the Pyrenees of Spain, and the plateau of Central Asia. Sheep raising does not require extensive equipment or heavy labor, but it does necessitate constant attention. Most sheep farms are located in hilly or rough areas on land unsuited to other agricultural enterprises. To distinguish the sheep in each flock, raisers generally mark the animals with paint or a stamping compound. Sheep flocks in Australia may number more than 100,000 head, but flocks ranging from 2,000 to 5,000 are most common. Most flocks in the United States run about 1,000 head, but there are herds as large as 50,000.

Sheep are generally shorn once a year, and within a year's time their wool may grow to lengths varying from 1 inch to 15 or more inches. The shearer works with a power machine, resembling a barber's electric clippers, which removes the whole fleece in one piece; an expert can clip between 100 and 200 sheep in a day. Wool obtained in this way is called shorn wool, whereas the fleece taken from the pelts of lambs or sheep slaughtered for meat is known as pulled wool. Of the two classes, shorn wool is the pre-

dominant type, produced in by far the greater quantities.

The raw wool comes to the manufacturer or mill in the form of fleeces, which are packed or shipped in bags or bales. The weight of the bags or bales varies in the different wool-producing areas. Australian and New Zealand bales, for example, weigh about 300 pounds; South African bales, about 370 pounds; South American bales, 1,000 pounds; and United States bags, from 225 to 350 pounds.

Types of Wool. There are two broad classifications of raw wool based on ultimate use: apparel-class wools and carpet-class wools. Carpet wools are coarser and usually longer than apparel wools. Comparative quality is designated in the wool trade by either the numerical or the blood

The diagram shows variations in fleece quality: the lower the number, the higher the quality.

Table 1—APPAREL WOOL GRADES

Blood system	Count or numerical system
Fine	64's, 70's, 80's
Half blood ($\frac{1}{2}$ blood)	60's, 62's
Three-eighths blood ($\frac{3}{8}$ blood)	56's, 58's
Quarter blood ($\frac{1}{4}$ blood)	48's, 50's
Low-quarter blood	46's
Common	44's
Braid	36's, 40's

system, both of which assign market grades to the various types of wool. The blood system, peculiar to the United States, is compared with the numerical or English system in Table 1. Fiber diameter, length, and general fiber soundness are primary considerations in the evaluation of each of these grades for use and marketing purposes. Among other important properties are contour, crimp, color, and the felting property.

Fine wool has a length of $2\frac{1}{2}$ to 5 inches, up to 2,400 "surface" scales to the inch, and a diameter of about $\frac{1}{2000}$ of an inch. Only pure Merino sheep or breeds with predominantly Merino blood produce fleeces classified as fine wools. These sheep are found principally in Australia, South Africa, and the United States. About 60 percent of the world's apparel wool is produced by crossbred and medium-wool sheep, such as the Corriedale, Southdown, Shropshire, Hampshire Down, and Dorset Down. This type of wool is grown principally in the United States, the United Kingdom, Australia, New Zealand, and South America.

Carpet wools are produced in all parts of the world by sheep that usually live under primitive conditions. A large proportion of these sheep are raised in African or Asian countries, among them the Somali, Hirrik or Iraqi, Sikkim Bera, and Tatarian breeds. Their wool consists of a long outer coat of hair protecting an undercoat of true wool.

Wool Supply. The annual world production of wool has been increasing steadily. Since 1956, it has exceeded 5 billion pounds (greasy basis), of which about 80 percent is classified as apparel wool and 20 percent as carpet wool.

Australia is the largest producer of wools in the world and the leading supplier of fine wools. Five countries of the Southern Hemisphere (Australia, New Zealand, South Africa, Argentina, and Uruguay) produce almost three fifths of the total world supply and about three fourths of the supply of apparel-class wool. Most of this wool is shipped thousands of miles across the world to countries such as the United States, which have large populations and insufficient wool supplies. The United States and the United Kingdom, which are the chief apparel wool consumers, also produce important quantities of this type of wool. The principal sources of carpet wools are the USSR, Argentina, Turkey, India, and China, which account for 45 percent of the total output of this class. The Balkan countries, New Zealand, Iran, Pakistan, Iraq, and the former French territories in North Africa produce the bulk of the remaining 55 percent.

WOOL PRODUCTION

Rank	Country	U. S. Tons (millions)	Metric Tons (millions)
1	Australia	780	710
2	Soviet Union	475	430
3	New Zealand	330	300
4	Argentina	195	175
5	South Africa	110	100
6	Uruguay	66	60
7	Turkey	55	50
8	United States	55	50
9	United Kingdom	55	50
10	Brazil	39	35
11	India	39	35
12	Iran	33	30
13	Spain	33	30
14	Pakistan	28	25
15	France	22	20

Wool-carding machines, which produce rovings (ropes of wool) for spinning, are in operation in a mill in Uruguay.

Marketing. The world's annual wool supply is marketed by two principal methods: (1) private or cooperative trading among growers, dealers, and manufacturers; and (2) auction selling by open competitive bidding. Practically the entire domestic production of the United States is marketed by the first method, while a number of other countries, including Australia, New Zealand, and South Africa, favor the auction method. Important wool marketing centers are located in Sydney, Australia; London, England; Boston, Mass.; and Buenos Aires, Argentina.

Another phase of wool trading is the wool futures market, where standard wool contracts, for either raw wool or wool top, are bought and sold by growers, merchants, and consumers. These contracts specify certain quantities and qualities of wool for future delivery. They are traded to obtain price insurance (hedging), to minimize losses on cash transactions or inventories of wool and processed wool goods, or to speculate for profit.

Uses and Manufacture. Wool is used chiefly to make woven and knitted apparel, but there are many other wool products, such as blankets, carpets, rugs, upholstery, draperies, industrial cloths, and felt. Because of its unique characteristics, wool sustains major segments of the textile and apparel industries.

The first step in preparing wool for manufacture into fabrics is sorting the varieties of wool. Fabrics made from wool for apparel purposes are woven or knit from woolen or worsted yarns, or made by felting the unspun fiber. Preparatory to making yarn, wool fibers of similar characteristics are carefully blended and then put through a

process known as carding in order to disentangle locks and bunches of fibers and to remove very short fibers, any remaining bits of burrs, and vegetable matter. The carding operation can be compared to combing and brushing one's hair. The process produces roving—a rope of wool adaptable for spinning into yarns. From this point, processing differs, depending on whether woolen or worsted yarn is desired.

Manufacturing woolen yarn utilizes a wider range of raw material, and there is more variety in the finished product. Woolen yarns require less processing to be made into cloth, since they are spun directly after carding. They are also more open, hairy, and irregular than worsted yarns.

Worsted manufacturing requires a combing process after carding, to remove the shorter fibers (noils) from the longer fibers; the noils are collected and used in making woolen yarns or pressed felts. The wool roving that comes from the cards in worsted manufacture is a web of fibers condensed into a thick strand adaptable for feeding into the worsted comb. The comb forms the longer fibers into a thick, uniform strand known as wool top, which then is reduced in size to a roving by being drawn through rollers for mixing and parallelization. When wool top is of a predetermined thickness and weight, it is ready for spinning into yarn.

Many wool products are woven on looms. In weaving, two sets of yarns are interlaced at right angles to each other. One, called the warp, runs lengthwise in the loom; the other, called the filling or weft, runs crosswise. The filling threads pass over and under the warp threads, alternately or at longer intervals.

Woolen and worsted fabrics generally vary in width between 54 and 60 inches. The length of a piece or cut is usually 50 to 70 yards, but in a few cases it may run from 120 to 140 yards.

Woolen and worsted cloths go through a series of finishing processes after they leave the loom. The primary object in finishing is to enhance the quality of the cloth by giving it a specific appearance and handle. There are two main groups of finishes for wool fabrics: clear finish and face finish, with modifications of both. Clear-finished fabrics, which include most worsted fabrics, have an even, unnaped surface, the weave and the colors being prominently developed. Face-finished fabrics, on the other hand, have a distinct nap or pile of fibers on the surface, a more indistinct weave, and usually more subdued and softened colors.

Wool may be dyed in any manufacturing stage. Sometimes the fiber is dyed immediately after scouring; in other cases, wool is dyed in the top, at the yarn stage, or in the finished fabric. In addition, wool fabrics are sometimes printed for use as neckwear, blouses, dresses, or beachwear.

Woolen and worsted yarns are knit by machine into such products as hosiery, sweaters, and cloth, the last to be made into coats, dresses, and other products. In addition, woolen and worsted yarns are prepared and marketed for hand knitting. Yarns used in carpet and rug manufacturing are usually coarser than those used in making apparel.

Wool felt is manufactured by a separate division of the wool textile industry, using a method handed down from antiquity. The felting property, which causes the fibers to adhere closely, is a prominent characteristic of wool. Felts are made from masses of unspun fibers by firmly enmeshing them through a combined mechanical-chemical

action that includes treatment by moisture and heat. Unwoven felts are used widely in the hat-making trades and for covering metallic and other surfaces in industry. Woven felt is used extensively in the piano industry, in printing, and in the chemical and optical trades. See also FELT.

Fabric Treatment. Scientists have learned that a marked protection of wool against loss of tensile strength can be obtained by using a surface agent on the fiber during processing. Addition of a nonionic surface-active agent to sulphuric acids was found also to give stronger yarn.

Treatments have been developed to protect wool products from attacks by insect larvae, such as moths and carpet beetles. The ideal mothproofing agent is required to be effective at low concentrations that are nontoxic to the wearer, and also to be undetectable by color or odor and to remain toxic to larvae after long exposure to light and air. One such general purpose insecticide now popular is of the chlorinated hydrocarbon type.

For years scientists have sought a process for shrinkproofing wool products. One development, introduced in 1961, enables all-wool products to retain their original characteristics when placed in home washing machines and drying machines. This process is based on the treatment of wool with potassium permanganate in concentrated common salt solution, followed by a clearing of these chemicals with sodium bisulphite. There are many other processes, one of which is referred to as interfacial polymerization. Here the product is dipped into a water solution of hexamethylenediamine and then into a solution of sebacyl chloride in a standard solvent.

The elasticity of wool fibers causes the desired creases in wool products to be unstable. Methods

High-speed spinning machines convert ropes of wool into tightly twisted yarns suitable for weaving.

AMERICAN SHEEP PRODUCERS COUNCIL

RICHARD DIBON-SMITH/PHOTO RESEARCHERS

Harris tweed is still woven by hand on the island of Lewis with Harris in the Outer Hebrides of Scotland.

have been developed for imparting permanent creases and pleats to 100 percent wool trousers and skirts without altering the recognized desirable characteristics of wool. One method, developed in Australia, involves application of a wool-setting chemical to the finished garment. A variation of this method treats fabrics at the mill with a wool-setting chemical. This remains in the cloth until activated by steam and baking, applied by the garment makers. The latter is referred to as "presensitized" fabric.

Reclaimed Wool, Secondary Raw Materials, and Byproducts. Because of wool's durability and relatively high cost among textile fibers, wool textile manufacturers use mill waste as well as reprocessed and reclaimed wool to make inexpensive fabrics for certain markets. In addition, other fibers are sometimes blended with wool to lower the manufacturing costs and retail prices of fabrics, to add strength, or to produce special effects.

Wool grease, known in its purified form as lanolin, is an important byproduct of the wool industry. It enjoys a wide industrial use in the production of pharmaceuticals, cosmetics, cutting oils, printing inks, lubricating greases, rust preventives, and varnishes.

Specialty Hair Fibers. Most of the wool we use comes from the sheep, but certain other animal fibers, which are closely related to wool and are basically termed wool, are used alone or in conjunction with sheep's wool to make clothing and other types of fabrics. These fibers come from the covering of goats, camels, llamas, alpacas, vicuñas, and certain fur-bearing animals. The specialty hair fibers, as they are called, are employed to add special effects of beauty, color, softness, or luster to fabrics.

Wool Products Labeling. In the United States wool producers, manufacturers, distributors, and consumers are protected against misrepresenta-

tion of wool products by the Wool Products Labeling Act, enacted by Congress in 1939. This law requires the labeling of all products containing wool except upholstery and floor coverings, and stipulates that the label show the percentage of total fiber weight represented by each kind of wool or other fiber present in a wool product. The term "wool" is defined in the act to mean the fiber from the fleece of the sheep or lamb or from the hair of the Angora goat, Kashmir (Cashmere) goat, camel, alpaca, llama, or vicuña, which has never been reclaimed from any woven or felted wool product; it may be reclaimed from spun yarn. Reprocessed wool is defined as wool fiber that has been reclaimed from woven or felted materials that have never been utilized in any way by the ultimate consumer. Reused wool is defined as wool fiber reclaimed from used or worn wool products. Virgin or new wool, as defined in the regulations under the act, is wool fiber that has never been in any way used, or reclaimed, reworked, or reprocessed from any spun, woven, knitted, felted, or manufactured product. Wool upholstery and wool carpetings are subject to the Textile Fiber Products Identification Act, effective March 1960.

WOOL GLOSSARY

- All-over Patterns.**—Patterns that cover the entire surface, as opposed to broken patterns, which appear in "repeats."
- American Spun.**—Wool yarns for worsted cloth construction, spun by a method developed in the United States. The process eliminates several steps used in the French and Bradford systems. See also *Bradford Spun* and *French Spun* in this glossary.
- Astrakhan.**—A heavy, curly pile fabric imitating the fleece of the karakul lamb. A luster wool is used in the worsted construction, along with slack twist yarns.
- Basket Weave.**—A loosely or tightly woven fabric in which two or more yarns are woven together in an over-and-under pattern, similar to that used in basketry.
- Blanket Cloth.**—A heavyweight woolen coating with a soft, raised finish.
- Bouclé.**—An over-all curly, loopy-faced fabric woven or knitted with special-effect yarns known as loop, curl, or bouclé.
- Bradford Spun.**—Yarn spun by the most universal of three systems of spinning. The system uses the circular or Noble comb for removing short wool fibers. See also *American Spun* and *French Spun* in this glossary.
- Broadcloth.**—An elegant lustrous wool fabric with a flatly napped surface.
- Brushed Wool.**—Wool fabrics that are loosely woven so that the fiber may be brushed up on the surface, to

hide patterns and warp and filling characteristics in mill-finished goods.

Challis.—An extremely lightweight, softly finished wool worsted fabric.

Cheviot.—A heavily fulled, hairy-napped wool cloth of either woollen or worsted construction. Wool from the Cheviot sheep was originally used, providing the rough surface characteristic of this cloth.

Covert.—Tightly woven wool with a firm texture and sharply angled lines.

Crepe.—A wool fabric made of fine, tightly twisted yarns, which may have a flat, grainy, or crinkled surface, depending on the amount of twist given to the yarns.

Doeskin.—A smooth, closely woven wool cloth with a soft, peach-skin surface that completely obscures the weave.

Faille.—Plain-weave wool cloth with heavier yarns in the filling than in the warp. It produces a flat, horizontal-ribbed fabric.

Felt.—A matted or web product made by applying heat and moisture to wool fiber. See also separate article **FELT**.

Flannel.—A cloth or fabric woven in both woollens and worsteds with a soft, slightly napped surface, used in suits, dresses, coats, dressing robes, and children's wear.

Fleece.—A heavy wool coating with a deeply napped surface which may be shaggy or close cropped.

French Spun.—Yarn spun by a system using a rectilinear comb for removing short wool fibers. Shorter fibers are used than in the Bradford system. See also *American Spun* and *Bradford Spun* in this glossary.

Gabardine.—A finely woven, finely twilled, clear-faced wool worsted fabric characterized by closely set diagonal ribs.

Harris Tweed.—A soft tweed spun, dyed, and handwoven in the southern part of the island of Lewis with Harris, Outer Hebrides, Scotland.

Herringbone.—A variation of twill weave which produces a pattern of continuous arrows.

Homespun.—A general term applied to loosely woven fabrics made from irregular woollen yarns. It has a rustic look.

Hopsacking.—A rough, loose-textured fabric made with a basket weave or basket-weave effect.

Jersey.—A flat knitted fabric, very elastic and pliable, used for many articles of dress, including blouses, shirts, bathing suits, gloves, and dresses.

Lamb's Wool.—Wool shorn from a lamb, up to eight months old, which never before has been clipped. It is noted for being especially soft in hand.

Looped Fabric.—A term applied to fabrics with bubbly, curly, loopy surfaces.

Melton.—A thick, heavyweight woollen fabric with the weave hidden by a smooth, feltlike surface.

Overcheck.—A design in which one check pattern is woven over another in a different size or pattern. It may also be a check pattern on a solid color ground.

Serge.—A right-hand-twill weave, clear-finish wool cloth, known for its durability and diagonal-rib look.

Sharkskin.—A hard-finished wool worsted fabric having a simple color pattern, for example, one color with white. The fabric is characterized by a delicate pebbly surface.

Shetland.—Properly, wool from sheep raised on the Shetland Islands off Scotland. It has a soft nap and shaggy surface of protruding fibers.

Tweed.—A strong wool fabric with a rough or fuzzy surface, which can be woven into monotone color blends and figured patterns such as checks and plaids.

Twill.—A wool worsted fabric with a steep, prominent diagonal rib. A distinct cut-line separates the ribs.

Velour.—A dressy coating fabric with a thick, raised pile and soft hand.

Wool.—The soft, curled coat of the sheep. Well-known breeds are the Corriedale, Cheviot, Cotswold, Dorset Horn, Merino, and Romney. In the United States, under the Wool Products Labeling Act of 1939, wool is defined as the fiber from the fleece of the sheep or lamb or from the hair of the Angora goat, Kashmir (Cashmere) goat, camel, alpaca, llama, or vicuña, which has never been reclaimed from any woven or felted wool product. It may be reclaimed from spun yarn.

Wool Velvet.—A luxury fabric distinguished by a deep, rich, cut-pile surface, soft and velvety in feeling.

Woollen.—A term applied to fabrics woven or knitted from loosely twisted yarns spun generally from shorter wool fibers. A soft, napped surface is a characteristic of woollen fabrics.

Worsted.—A term applied to fabrics woven from tightly twisted wool yarns that are spun from long, fine, carefully combed wool fibers. A firm, crisp hand is a characteristic of worsted fabrics.

WOOLF, woölf, Arthur, English engineer and inventor: bap. Camborne, Cornwall, England, Nov. 4, 1766; d. The Strand, Guernsey, Oct. 26, 1837. After serving his apprenticeship as a carpenter in Cornwall, he went to London, where he became a master engineer in 1795 and in the following year engineer for a brewery, a post he held until 1806. Meanwhile, he patented a new boiler (1803) and improvements in the steam engine (1804, 1805). He went into partnership with Humphrey Edwards in 1806 and four years later took out a patent on his best-known invention, the Woolf engine, the first practical compound engine. Dissolving his partnership in 1812, he returned to Cornwall, where he devoted himself to improving the mechanics of mining and was superintendent of an engine-manufacturing works at Hayle.

WOOLF, Leonard Sidney, English author and publisher: b. London, Nov. 25, 1880; d. Rodmell, Sussex, Aug. 14, 1969. He held scholarships at St. Paul's School and Cambridge. He then was a member of the Civil Service in Ceylon from 1904 to 1911, when he resigned and returned to England to try his hand at writing. In 1912 he married Virginia Stephen (see **WOOLF, VIRGINIA**), and together they contributed much to the literary and intellectual excitement of the Bloomsbury district of London.

Woolf's first book was a novel based upon his experiences in Ceylon, *The Village in the Jungle* (1913), exposing evils of colonialism. With the advent of World War I he gave up fiction for politics and sociology and began, as a journalist, to contribute to the *New Statesman*, the *Nation*, and other periodicals. He was also on the editorial staff of review journals and political quarterlies and was an active member of such organizations as the Fabian Society and the Labour Party. The following books project his interest in socialism, the cooperative movement, anticolonialism, and international government: *International Government* (1916), *The Future of Constantinople* (1917), *Co-operation and the Future of Industry* (1918), *Empire and Commerce in Africa* (1920), *Socialism and Co-operation* (1921), and *Imperialism and Civilization* (1928).

During the 1920's Woolf undertook a study of "communal psychology," the relationship between political thought and action during the past two centuries, and wrote *After the Deluge* (2 vols., 1931-39), which deals with developments in democracy up to the year 1848. A third volume, *Principia Politica: a Study of Communal Psychology* (1953), treats the 20th century clash of liberty and authoritarianism.

In 1917 he and Virginia Woolf had bought a small printing press and begun the Hogarth Press as an amateur enterprise. It became a notable success, and after his wife's death it was reorganized with associate directors. He edited three volumes of posthumous miscellanea by Virginia Woolf and during her life was her most trusted editor and critic. After World War II he continued to write books concerned with international politics and world government. A rebel against Victorianism and the empire, he never ceased to devote himself to a rational pursuit of truth and justice as writer, publisher, and practical politician.

WOOLF, Virginia (nee **ADELIN VIRGINIA STEPHEN**), English novelist, short-story writer, and critic: b. London, England, Jan. 25, 1882; d. Lewes, Sussex, March 28, 1941. The second daughter of Sir Leslie Stephen (q.v.), she was only 13 at the death of her mother, the former Mrs. Julia Duckworth, to whose beauty and nobility of character Henry James paid tribute. Virginia's combination of humanity and reserve reflected that of her parents. She was educated through "the free run of a large and unexpurgated library," owned by her father. When he died, in 1904, she moved, together with her sister Vanessa and brothers Adrian and Thoby, to Gordon Square, Bloomsbury, London. The first of her many reviews for the *Times Literary Supplement* dates from 1905. The death of her brother Thoby in 1906 gave a further shock to her delicate health, already affected by the death of her father. In 1907 she settled in Fitzroy Square, London, with her brother Adrian, her sister having married the art critic Clive Bell. The meetings of the Bloomsbury Group began at this time, and Virginia started to formulate the critical ideas and theories which preceded her creative career. In 1912 she married Leonard Sidney Woolf (q.v.), and together they launched the Hogarth Press in 1917.

Virginia Woolf

Gisèle Freund

Virginia Woolf's first novel, *The Voyage Out* (1915), is comparatively conventional and autobiographical, though she is already concerned with what she calls in her next novel, *Night and Day* (1919), "arrows of sensation striking strangely through the envelope of personality which shelters us so conveniently from our fellows." The merging of the individual consciousness with the world of sensation or nature leads to the disappearance of character and plot as they existed in the traditional, realistic novel. This method is further developed in the impressionistic study of a talented young man's world, *Jacob's Room* (1922), and in *Mrs. Dalloway* (1925), a complex image of life revealed through the thought and action of a single day in London. The conflict between the art of living (the social graces in which Mrs. Dalloway excels) and the masculine worlds of thought and action, or the actual horrors of existence as it has to be lived by some are also themes of her next and finest novel, *To the Lighthouse* (1927). After the extreme fantasy of *Orlando* (1928) and the symbolism of *The Waves* (1931), her creative urge declined. The next novel, *The Years* (1937), treats repetitive cycles of a London family. In the meantime, she had turned to

biography, alternating between the fancifulness of *Flush* (1933), on Elizabeth Barrett Browning's dog, and a friendly tribute, *Roger Fry* (1940).

Virginia Woolf had experienced mental collapses early in life and finally committed suicide by drowning. Her best critical essays are contained in *The Common Reader* (1925; 2d series 1932). *A Room of One's Own* (1929) is rather strident in its feminism; likewise *Three Guineas* (1938), in its ridicule of masculine pomposity. Leonard Woolf edited several volumes of her criticism, published posthumously. He also printed her final novel, *Between the Acts* (1941), completed just before her death; a collection of short stories, *A Haunted House* (1943), including the major part of *Monday or Tuesday* (1921); *A Writer's Diary* (1953); and *Letters* (1956), collected and edited by Leonard Woolf and James Strachey from her correspondence with Lytton Strachey.

WOOLLCOTT, wōōl'kāt, Alexander (Humphreys), American essayist and journalist: b. Phalanx, N.J., Jan. 19, 1887; d. New York, N.Y., Jan. 23, 1943. After graduating from Hamilton College in 1909, he became a reporter for the New York *Times* and was promoted to drama critic in 1914. During World War I he was assigned to the Army newspaper *Stars and Stripes*. After the war he returned to his post as drama critic on the *Times* but left it in 1922 for the New York *Herald* and from 1925 to 1928 reviewed for the New York *World*. He then began a popular radio program as "The Town Crier" and gained considerable fame as an eccentric public personality, a raconteur, and an arbiter of popular reading. He also edited a column, "Shouts and Murmurs," for the *New Yorker*.

Woolcott's books, though mostly collections of journalistic writing, reveal the qualities that made him famous as a conversationalist and radio entertainer. These essays and sketches display his excitable enthusiasms, acid quips, and genius for anecdotes and gossip. Representative volumes are *Shouts and Murmurs* (1922), *Enchanted Aisles* (1924), *While Rome Burns* (1934), and *Long, Long Ago* (1943). He collaborated with George S. Kaufman in writing the plays *Channel Road* (1929) and *The Dark Tower* (1934); performed in S. N. Behrman's *Brief Moment* (1931) and *Wine of Choice* (1938); and eventually starred briefly in a road production of *The Man Who Came to Dinner* as Sheridan Whiteside, a character that Kaufman and Moss Hart modeled upon Woolcott himself. Since his writing captured the wit and originality so characteristic of his personality, his informal

essays have survived the ephemeral fate that has historically been the lot of most mere newspaper journalism.

WILLIAM BRACY.

WOOLLETT, wŏl'ət, **William**, English engraver and etcher: b. Maidstone, Kent, England, Aug. 15, 1735; d. London, May 23, 1785. Apprenticed at an early age to John Tinney, Fleet Street engraver, Woollett later studied pictorial art at the St. Martin's Lane Academy, where he distinguished himself in such subjects as anatomy and perspective. He soon became preeminent among English reproductive line engravers and won European renown with *The Death of Niobe* (1761), after Richard Wilson's painting. In 1775 he received an appointment to be engraver to George III.

Woollett's two most celebrated works, after pictures by Benjamin West, are *The Death of General Wolfe* (1776) and *The Battle of La Hogue* (1781). Hampered by near-sightedness and the necessity of using a magnifying glass, he was a slow worker, often collaborating with other men. In all, he completed 123 engravings over the course of his lifetime. Most of them were landscapes after Claude Lorrain and his English imitators. Woollett's remarkable output, considering his handicap, constituted an achievement which secured him a mural tablet in Westminster Abbey after his death.

Woollett's landscapes seem to capture the measure and balance of the Augustan language of his day as expressed in such a poet as James Thomson. His practice of having a preliminary etching, followed by a second and even third biting, as the foundation upon which to exercise the graver or burin fixed the method and contribution of the English school of engraving. Working with the burin along the furrows of the etched copper plate, Woollett created the classic look of brightness that falls from the skies to drench the foliage and to meet the silver and gold rising from the waters. In portraits he was equally successful. Here he used his considerable skills to maximum advantage, teasing the lines of expressive tension in face or hands to reveal colorations of mood and transparencies of character.

PHILIP RODDMAN.

WOOLLEY, wŏl'ē, **Celia Parker**, American settlement worker and clergyman: b. Toledo, Ohio, June 14, 1848; d. Chicago, Ill., March 9, 1918. After graduating from the Coldwater Female Seminary in Michigan, she married Jefferson H. Woolley, a dentist, in 1868; eight years later the couple moved to Chicago. There Celia Woolley became interested in the cultural and civic life of the city and developed her talent for writing. Her lifelong interest in religion led her to study for the ministry, and at the age of 46 she was ordained in the Unitarian Church. From 1893 to 1898 she held pastorates in the church but then resigned to return to writing and lecturing. Her urge to serve society finally led her to the field of social work, and in 1904 she established the Frederick Douglass Center on the south side of Chicago for work among the black population. Together with her husband, Woolley lived at the settlement the rest of her life, working tirelessly for the betterment of race relations and gaining the cooperation of many important figures in the city.

WOOLLEY, John Granville, American prohibitionist: b. Collinsville, Ohio, Feb. 15, 1850; d. Granada, Spain, Aug. 13, 1922. After graduating from Ohio Wesleyan University in 1871, he studied law and was admitted to the bar in 1873. He practiced successfully in Paris, Ill., and Minneapolis, Minn., and then about 1885 began practicing in New York City.

Some years earlier he had become addicted to alcohol, which caused him severe problems, but in 1888 he effected a self-reform and became a prohibitionist. His earnestness in helping others to overcome the habit brought a position of world leadership in the prohibition movement. During his speaking tours, while lecturing in many countries to large audiences, he was noted for his sympathy and kindness toward those who had problems with alcohol.

Woolley became editor of the *New York Voice* (later *New Voice*), a prohibition organ, in 1899 and continued in this capacity for seven years. In 1900 the Prohibition Party nominated him for the presidency of the United States, and in the election he received 208,914 votes. For the next 20 years Woolley continued with his prohibition work and died while on a fact-finding tour concerning the issue of alcohol abuse in Europe. Woolley's writings, which were popular with prohibitionists of the time, include *Seed* (1893); *The Christian Citizen* (1900); *A Lion Hunter* (1900); *South Sea Letters*, with his wife (1906); and *Civic Sermons* (8 vols., 1911).

WOOLLEY, Sir (Charles) Leonard, English archaeologist: b. London, England, April 17, 1880; d. there, Feb. 20, 1960. He began his professional career as assistant keeper of the Ashmolean Museum, Oxford. His first archaeological work abroad was in Nubia with the Eckley B. Coxe, Jr., Expedition (1907-1911) and the Oxford University Expedition (1912). With the assistance of T. E. Lawrence he conducted excavations for the British Museum at Carchemish (1912-1914), a site to which he returned in 1919 after having been a prisoner of war in Turkey. Woolley's reports of these excavations were subsequently published in *Carchemish*, 3 vols. (1914, 1922, 1953).

After a season at Tell el Amarna (1921-1922) for the Egypt Exploration Society, Woolley began the work for which he is best known, the excavations at Ur (q.v.) in Iraq on behalf of the British Museum and the Museum of the University of Pennsylvania. This project attracted much public interest by the richness of the objects found and the dramatic circumstances of the burials in the Royal Cemetery. Preliminary reports appeared in the *Antiquaries Journal* (vols. 3-14, London 1923-34). Fuller publication was undertaken in *Ur Excavations*, projected in 10 volumes by Woolley with some contributions by others. Published volumes include volume 1, *Al 'Ubaid* (1927), with H. R. Hall; volume 2, *The Royal Cemeteries* (1934), with chapters by others; volume 4, *The Early Periods* (1955); and volume 5, *The Ziggurat and Its Surroundings* (1939). Woolley's more general books referring to this work are *The Sumerians* (1928); *Ur of the Chaldees* (1929); *Digging Up the Past* (1930); *Abraham* (1935); *The Development of Sumerian Art* (1935); *Excavations at Ur; a Record of 12 Years' Work* (1954); *History Unearthed* (1958); and his posthumous *The Art of the Middle East* (1961). He was knighted

by King George V in 1935.

Woolley later dug at al-Mina near Antioch, Syria (1936-1937), and then at Atchana in the Hatay (1937-1939 and 1946-1949). The results were published in *A Forgotten Kingdom* (1953) and *Alalakh* (1955). Although his dating, especially of the Sumerian period, has been much changed by work on other sites by other scholars, his work is still considered to be of great importance.

CHARLES K. WILKINSON,
Curator, Near Eastern Art, The Metropolitan
Museum of Art, New York City.

WOOLLEY, Mary Emma, American educator: b. South Norwalk, Conn., July 13, 1863; d. Westport, N.Y., Sept. 5, 1947. She was an instructor in Wheaton Seminary at Norton, Mass. (1886-1891), and in 1894 became the first woman to receive a B.A. degree from Brown University. She then completed her M.A. there and taught at Wellesley College (1895-1900), the last two years as professor and head of the Department of Biblical History and Literature. In 1900 she became president of Mount Holyoke College, whose subsequent growth and development were in large part due to her efforts on its behalf.

In a nationwide poll in 1932, Miss Woolley was named one of the 12 greatest American women. She was closely identified with many organizations and movements concerned with education, religion, and world peace, serving on the board of electors of the Hall of Fame, the national board of the YWCA, and the international relations committee of the American Association of University Women. In 1922 she had made a six-month tour of China as a member of the Commission on Christian Education. She was the first woman delegate to the Geneva Conference for Reduction and Limitation of Armaments (1932) and was reappointed by President Franklin D. Roosevelt the following year. In 1944 she organized the Committee for the Participation of Women in Post-War Planning. Her publications include *Early History of the Colonial Post Office* (1894), *Internationalism and Disarmament* (1935) and numerous articles on education and international affairs.

CLAUDE A. EGGERTSEN,
Professor of Education,
University of Michigan.

WOOLLY BEAR, wōl'ē bār, a name applied to the caterpillar of any of the tiger moths, of the family Arctiidae. Frequently the moths are strikingly marked with streaks of yellow, orange, or red on a black background on the front wings and dark spots on a light background on the hind wings. The larvae all have long and, often, dense hair. The best known of the American species is *Isia isabella*, which occurs over the whole of the United States and southern Canada. Its caterpillar is black in front and behind, with the middle portion brownish red. It is famous because it has been looked upon as a weather prophet since colonial times. There is variation in the width of the reddish band, which may be quite wide, the hairs of the posterior black band being partly or wholly replaced by red. It is said that the wider the red band, the warmer the coming winter will be. In the colder regions of the insect's range, the red band usually covers three or four segments, while in

other regions four or five segments are usually covered. Variation in the width of the band occurs in all areas but is less marked in the north.

To determine the accuracy of the woolly bear as a weather forecaster, the present author began a series of annual surveys at Bear Mountain, N.Y., in 1948. From 40 to 70 caterpillars were collected each year, and the average width of the bands, which were extremely variable, was determined by counting the number of red segments. The average ranged from 4.5 to 5.6 red segments. In the first five years the caterpillars were right four times, but they were wrong in predicting a colder winter the fifth year. The cause of variation in the width of the bands is not known, but heredity enters into the picture. The *Isia isabella* caterpillar feeds on sweet clover, plantain, and other weeds.

A common relative is the fall webworm, *Hyphantria cunea*, a white moth, the larvae of which build large, loose tents on the outer branches of deciduous trees in the autumn. The salt-marsh moth, *Estigmene acrea*, occurs over most of North America and is a pest on various cultivated crops.

CHARLES H. CURRAN,
Former Curator, Department of Insects and
Spiders, The American Museum of Natural
History, New York City.

WOOLMAN, wōl'mən, John, American Quaker leader and abolitionist: b. Ancocas (later Rancocas), N.J., Oct. 19, 1720; d. York, England, Oct. 7, 1772. Born in a rural Quaker community, the fourth child in a family of 13, he was a product of the Quaker way of life as well as a genius in his own right. As a child he was thoughtful and compassionate. Having learned the trade of tailoring as a young man, he became a successful shopkeeper in Mount Holly, N.J., and was the proprietor of an orchard. From time to time he was engaged in other means of livelihood, including schoolteaching, surveying, and conveyancing. Uneasy at the prospect of prosperity, he gave up trade in order to have a mind free from "outward care and cumber." When he was 23, his Quaker meeting formally recognized him as having a gift in vocal ministry.

Though in no sense a professional minister, for none existed in the Society of Friends, Woolman frequently traveled under religious concern to visit Friends meetings and families throughout the colonies. Often he journeyed on foot. As a pioneer in the antislavery cause, he ultimately exerted an influence far beyond the religious society to which he belonged and helped to lay the spiritual foundation for the abolition movement. In this work he was joined by a large group of other Quakers, among whom the next in influence was Anthony Benezet. Woolman's last journey took him to England, where he died of smallpox.

Woolman's most remarkable trait was his ability to convey to wrongdoers unpalatable truth in such a spirit of sympathy, love, and sincerity that no feeling of bitterness resulted. In his interviews with slaveholders his success was due to a simple appeal to their consciences. The slaveowner, Woolman felt, suffered as acutely from slavery as did the slave and so became equally an object of compassion. In 1758, largely as a result of Woolman's inspired appeal, the Philadelphia Yearly Meeting of Friends decided

to free itself from slaveholding. By 1776 this process was accomplished, by the use of persuasion. The Quaker abolitionists passed on their concern to their successors in the abolitionist movement, but they did not succeed in passing on their method. The historian George Macaulay Trevelyan expressed the situation in this way: "Close your ears to John Woolman one century and you will get John Brown the next, with Grant to follow."

Woolman was deeply troubled by the wretched condition of the poor and the spiritual state of the rich who caused this condition. The approach of the French and Indian War (1754–1763) found the Quaker rulers of Pennsylvania forced either to compromise their peaceable principles or resign their position of authority. By this time many had become wealthy, and Woolman pointed out that the seeds of war lay in the desire of people for power and possessions. He supported those who refused to pay a tax levied by the Pennsylvania colonial assembly to pay for the war.

Woolman's unaffected love for all human beings, indeed for all living creatures, is shown in many passages of his writings. During a journey among the Indians at a time of war and danger, he carefully examined his motives and concluded "Love was the first motion" and "that I might feel and understand their life and the spirit they live in, if haply I might receive some instruction from them." The Quaker belief in the Inward Light, which Woolman calls "Pure Reason," as existing in all men, operated to break down all barriers of race, religion, sex, age, or education. It was "pure" in the sense of being free from all conventionality.

Today Woolman is known principally for his incomparable *Journal*, or spiritual autobiography, first published posthumously in 1774. The simplicity and beauty of its language reflect parallel qualities in Woolman's life. The *Journal*, said William Ellery Channing, is "beyond comparison the sweetest and purest autobiography in the language." Henry Crabb Robinson describes it as composed in "a style of the most exquisite purity and grace." But it is not the style of the writing in this and Woolman's other works so much as his indefatigable zeal as a social reformer that marks the writing as authentic. The best known of the many editions of the *Journal* was first published in 1871. It contains an extended introduction and appreciation by John Greenleaf Whittier.

In addition to the *Journal*, Woolman's essays had wide circulation and exerted a powerful influence. Notable are *Some Considerations on the Keeping of Negroes*, parts 1 and 2, published in 1754 and 1762; and *A Plea for the Poor*, published posthumously in 1793.

HOWARD H. BRINTON,
Emeritus Director, Pendle Hill Graduate School
of Religion and Social Study, Wallingford,
Pa.

WOOLNER, wōol'nar, **Thomas**, English sculptor and poet: b. Hadleigh, Suffolk, England, Dec. 17, 1825; d. London, Oct. 7, 1892. At the age of 12 he became a pupil and assistant of William Behnes and in 1842 entered the schools of the Royal Academy. His first early success was his statue of *Puck*, done in 1847, which attracted the attention of Alfred, Lord Tennyson. In the same year he met Dante Gabriel Rossetti and the

painter William Holman Hunt, and under their influence became one of the original members of the Pre-Raphaelite Brotherhood. As a result of this association his sculpture became reminiscent of the works of the early Italian Renaissance, and he undertook various literary projects, achieving some recognition for his poetical romances first published in the *Germ*, the magazine of the Pre-Raphaelites. These poems, with others added to them, were collected and separately published in 1863 as *My Beautiful Lady*.

Woolner's lack of early commercial success led him to attempts at portrait sculpture and finally took him in 1852 to the goldfields of Australia where, however, he prospered more by the sculptor's chisel than by the miner's pick. In 1854 he returned to England. Public recognition came to him late, but from then on he occupied a distinguished position in English art. He was acquainted with many of the leading literary figures of his day, such as Charles Dickens, Tennyson, William Wordsworth, and Thomas Carlyle, and made portrait busts and medallions of many of them, as well as of such public figures as Charles Darwin, William Gladstone, John Stuart Mill, and John Cardinal Newman. His other sculptural works were mainly concerned with historical and romantic subjects, such as *The Death of Boudicea* (1844), *Guinevere* (1872), and *Lady Godiva* (1876). He was elected a member of the Royal Academy in 1874 and was professor of sculpture there from 1877 to 1879.

WOOLSACK, wōol'sāk, a large square sack filled with wool, covered with red cloth, and shaped somewhat like an ottoman, serving as the seat of the lord chancellor in the English House of Lords. Often the term is used to symbolize the office of the lord chancellor. The woolsack is believed to have been instituted during the reign of Edward III to remind the lords of the realm of the importance of the wool trade to the kingdom.

WOOLSEY, wōol'sē, **Sarah Chauncey**, American writer: b. Cleveland, Ohio, Jan. 29, 1835; d. Newport, R.I., April 9, 1905. She grew up in a comfortable home in Cleveland, then moved with her family to New Haven, Conn., where her uncle, Theodore Dwight Woolsey (q.v.), was president of Yale. After her father's death in 1870, she began to publish verse and prose under the pseudonym Susan Coolidge. She is best known for her popular books for girls, beginning with *The New Year's Bargain* (1871) and *What Katy Did* (1872) and continuing in rapid sequence during the next two decades. She also did three volumes of verse (1880, 1889, 1906), wrote *A Short History of the City of Philadelphia* (1887), and edited numerous literary papers and letters.

WILLIAM BRACY.

WOOLSEY, Theodore Dwight, American college president and scholar: b. New York, N.Y., Oct. 31, 1801; d. New Haven, Conn., July 1, 1889. A nephew of Timothy Dwight (1752–1817; see DWIGHT), he graduated from Yale College in 1820 and studied law in Philadelphia and theology at Princeton. He was licensed to preach in 1825 and, after studying abroad (1827–1830), became professor of Greek at Yale (1831–1846) and president of the college (1846–1871). Be-

sides editions of several Greek plays and dialogues, his publications include *Introduction to the Study of International Law* (1860; 5th ed. 1879); *Essay on Divorce and Divorce Legislation* (1869); *Religion of the Past and of the Future* (1871); *Political Science* (1878); and *Communism and Socialism* (1880). Some authorities hold that he made the first systematic study of American politics and consider his writings on international law to be authoritative sources. Woolsey also edited Francis Lieber's works *On Civil Liberty and Self-Government* (3d ed., 1874) and *Manual of Political Ethics* (2d ed., 1875). From 1871 to 1881 he was chairman of the American company of revisers of the New Testament. Woolsey Hall at Yale University was named in his memory.

Woolsey's son, Theodore Salisbury Woolsey (1852-1929), was a jurist and a professor of international law at the school of law at Yale.

CLAUDE A. EGGERTSEN.

WOOLSON, wŏol'sŏn, **Constance Fenimore**, American novelist: b. Claremont, N.H., March 3, 1840; d. Venice, Italy, Jan. 24, 1894. She grew up in Cleveland, Ohio, and decided to become a professional writer after her father's death in 1869. During the 1870's she lived mainly in the Carolinas and Florida. Following the death of her mother (a niece of James Fenimore Cooper), in 1879, she lived and traveled in Europe, mostly in Italy and England.

Miss Woolson's early writings include reminiscences of life in Ohio, *The Old Stone House* (1873), and numerous magazine publications, some of which were collected in *Castle Nowhere: Lake Country Sketches* (1875). Sympathetic observations of Southern postwar conditions are found in *Rodman the Keeper: Southern Sketches* (1880). Her five novels have special interest for their regional settings: *Anne* (1882), Mackinac Island; *For the Major* (1883), western North Carolina; *East Angels* (1886), St. Augustine, Fla.; *Jupiter Lights* (1889), Georgia and the Great Lakes country; and *Horace Chase* (1894), Carolina and Florida. Constance Woolson's fame rests chiefly upon her pioneer work as a regionalist, particularly her stories about the South.

WILLIAM BRACY.

WOOLSTON, wŏol'stŏn, **Thomas**, English deist: b. Northampton, England, 1670; d. London, Jan. 27, 1732/1733. After graduating from Cambridge University, he became a fellow of his college, Sidney Sussex, and was duly ordained. The study of Origen converted him to the allegorical interpretation of Scripture, and his first book (*The Old Apology for the Truth of the Christian Religion Against the Jews and the Gentiles Revived*, 1705) advocated this approach to the Bible. In three *Letters* (1720-21) he maintained that allegory was the only key for unlocking Biblical truth. Next he defended the Quakers, whom he considered exponents of his position. Woolston began to show symptoms of abnormality, and even his sympathizers questioned his sanity. In 1722 he published *A Free Gift to the Clergy* (the first of four companion volumes), in which his tendency to indulge in uninhibited abuse appeared in pronounced form. In his first incursion (1725) into the deistic controversy (see **DEISM**), he applied his allegorical method of Biblical criticism to the virgin

birth and the resurrection of Christ, and challenged the historical reality of both in *The Moderator Between an Infidel and an Apostate*. As a result he was prosecuted for blasphemy, but friends induced the authorities to drop the case. In his next book (*A Defence of the Miracle of the Thundering Legion*, 1726), Woolston appeared to greatest advantage. The work reflected his learning and ingenuity, and it ended with a noble plea for liberty of the press: "It is the opposition of others which sharpens wit and brightens truth."

Woolston's most serious contributions to the deistic controversy concerned New Testament miracles. In 1727 he published *A Discourse on the Miracles of Our Saviour*; by 1729 five further installments had appeared. His views became increasingly extreme. He dismissed the raising of Lazarus as "a fraud" and branded Christ's resurrection as "the most barefaced imposture ever put upon the world." The results were twofold: a spate of books attacked his opinions, and his prosecution for blasphemy was revived in 1729. He was found guilty and sentenced to imprisonment and a fine; since he could not pay the fine, nor could he give the required security for his good behavior during his lifetime, he remained in prison until his death. Woolston was an able scholar and a vigorous writer, but even his friends found him extreme and unbalanced.

GERALD R. CRAGG,

Andover Newton Theological School

WOOLWICH, wŏol'tj, metropolitan borough, London, England, lying mostly on the south bank of the Thames River, about 10 miles southeast of the City. It is joined to an outlying section north of the river by a vehicular ferry and a pedestrian subway. The borough, which includes Plumstead and Eltham, is a busy industrial center for engineering and other industries, especially telecommunications equipment.

Woolwich was a fishing village when Henry VIII chose it as the site of his chief naval dockyard. The 1,000-ton *Henry Grace à Dieu* (*Royal Harry*) was launched here in 1514, and ships were also constructed here for Sir Francis Drake and Sir Walter Raleigh. Ships continued to be built at the yard until the mid-19th century. To the east of the dockyard is the Royal Arsenal, which originated in the 17th century as a fortification against the Dutch Fleet. Also to this location (known as the Warren until 1805) were transferred various ordnance departments. Woolwich Common lies 400 feet above the old town.

At Eltham, in the southern part of the borough, are the well-restored remains of a royal palace, used by English monarchs from the time of Henry III to James I. Part of the structure, a 15th century banqueting hall, has been incorporated into Eltham Hall, the building that now houses the Institute of Army Education. Pop. (1961) 146,397.

H. GORDON STOKES.

WOOLWORTH, wŏol'wŭrth, **Frank Winfield**, American merchant: b. Rodman, N.Y., April 13, 1852; d. Glen Cove, April 8, 1919. After receiving a public and commercial school education, he worked as a clerk in various stores and in 1877 entered the employ of W. H. Moore, a merchant of Watertown, N.Y. Hearing of a store which sold only five-cent items, Woolworth persuaded Moore

to try the scheme, which immediately proved successful. Moore then established Woolworth in a five-cent store in Utica, N.Y., but the venture failed. Woolworth, again backed by Moore, next opened (1879) a five-and-ten-cent store in Lancaster, Pa., which was successful. From then on he began launching other stores in other cities. In 1912 four chains of stores owned by former partners of Woolworth's were absorbed by the F. W. Woolworth Company, of which he was president; by 1919 the company was operating more than 1,000 stores in the United States and Canada. Woolworth himself amassed a great fortune and was director of various banks and trust companies. In 1912-1913 he built, in New York City, the famous Woolworth Building, a handsome Gothic structure of 60 stories (800 feet), designed by Cass Gilbert and for a time known as the world's tallest building.

WOONSOCKET, wōon-sōk'it, city, Rhode Island, in Providence County, on the Blackstone River, 13 miles north-northwest of Providence. Woolen and worsted goods are the principal products of this industrial city; other manufactures include rubber, electronic and metal products, and paper products, textile machinery, machine tools, and chemicals. Woonsocket is the seat of Hill College and the Harris Institute Library. There are many parks in the city, including Barry Memorial Field and Cold Spring Park. Of the numerous churches, a large proportion are Roman Catholic since the population of Woonsocket is predominantly French Canadian.

History.—The name of the city is derived from the Indian name Miswosakit, meaning "at the very steep hill." The land was bought from the Nipmuc Indians by a Providence committee in 1662. The first settlers were John and Richard Arnold, the latter of whom built a sawmill on the Blackstone River here in 1666. In 1720 a group of Quakers established a forge which produced farm tools for the locality. The textile industry began in 1810 with the opening of cotton mills, and until 1901 cotton was the chief product of the city. The wool industry gained prominence from 1840 on and gradually outstripped cotton. Machine and tool manufacture was stimulated by the needs of the textile industry.

The early inhabitants of Woonsocket were of colonial stock, but, with the advent of industrialization in the early 19th century, there was heavy immigration, first from England and Ireland and later from Canada. Woonsocket was originally situated within the towns of Cumberland and North Smithfield. The Cumberland area was separated in 1867, the North Smithfield area in 1871, and Woonsocket was incorporated as a city in 1888. It is governed by a mayor and council. Pop. 45,914.

WOOSTER, wōos'tar, **David**, American Revolutionary officer: b. Stratford, Conn., March 2, 1711; d. Danbury, Conn., May 2, 1777. He graduated from Yale College in 1738 and was commissioned in the Connecticut militia in 1741. After serving as a captain of Connecticut troops at the successful siege of Louisburg (Louisbourg), Canada, in 1745, he was one of the few colonials to win a regular British army commission. During the French and Indian War, he advanced to militia brigadier general and saw extensive action in the lengthy northern campaign. At the beginning of the American Revolution in 1775, he was an

early advocate of the capture of Ticonderoga and was made a major general of Connecticut militia; but when the Continental Congress awarded him a regular commission as a brigadier general only, he became quarrelsome. He participated, nevertheless, in the abortive Canadian expedition of 1776 and succeeded to command after the death and seizure of his superiors; but his leadership was ineffective, and Congress recalled him, leaving him with his rank but no field command of troops. He returned home and was later killed at the Battle of Danbury while serving as a militia major general.

DAVID ALAN WILLIAMS.

WOOSTER, city, Ohio, seat of Wayne County, situated on Killbuck Creek, 30 miles southwest of Akron. A trading center in a dairying and farming area, it manufactures rubber, metal, and paper products, truck bodies, mill machinery, food products, pumps, and tools. Oil and gas wells are in the vicinity. The city is the seat of the College of Wooster (see WOOSTER, COLLEGE OF), and the Ohio Agricultural Experiment Station is nearby. The Wayne County Historical Museum has a collection of natural history specimens and relics of pioneer days. Settled in 1807, the town was named for David Wooster (q.v.), the Revolutionary War general, and incorporated in 1817. It is governed under its original charter by a mayor and council. Pop. 19,289.

KATHERINE SCHANTZ.

WOOSTER, College of, a coeducational liberal arts institution in Wooster, Ohio, affiliated with the United Presbyterian Church. It was chartered in 1866 and opened in 1870. In 1914 the name was changed from the University of Wooster to the College of Wooster. The campus occupies 276 acres in the northern part of the city. The college offers bachelor of arts, bachelor of music, and bachelor of music education degrees. A significant feature of the curriculum is a required independent study program for juniors and seniors. The college colors are gold and black; the athletic teams are nicknamed the "Scots." Enrollment averages approximately 1,650.

RODNEY S. WILLIAMS.

WORCESTER, 6TH EARL and 2D MARQUESS OF. See STEAM ENGINE.

WORCESTER, wōos'tar, **Elwood**, American clergyman: b. Massillon, Ohio, May 16, 1862; d. Kennebunkport, Me., July 19, 1940. After receiving degrees from Columbia College and the University of Leipzig, he was appointed chaplain and professor of philosophy and psychology at Lehigh University (1890) and ordained in the Protestant Episcopal Church. Desiring a broader scope for his ministry, he went to St. Stephen's Church in Philadelphia (1896) where, in addition to his preaching, he developed various philanthropic projects. In 1904 he became rector of Emmanuel Church in Boston and from that time began developing his theory that a combination of religion and medicine could be effective in curing nervous disorders. Many of Boston's leading doctors and psychiatrists cooperated with him wholeheartedly, and the church clinics were thronged. Samuel McComb, another clergyman, became Worcester's close associate in this work, which came to be known as the Emmanuel Movement. In 1929 Worcester resigned his rectorship and opened

Worcester's imposing cathedral, overlooking the River Severn, was largely completed in the 14th century.

offices for patients. His doctrine of Christian psychotherapy continued to receive attention both at home and abroad. His publications include *The Christian Religion as a Healing Power*, with S. McComb (1909); *Body, Mind and Spirit*, with S. McComb (1931); and the autobiographical *Life's Adventure* (1932).

WORCESTER, wŏɔs'tər, **Joseph Emerson** (1784–1865), American lexicographer and geographer. He was born in Bedford, N.H., on Aug. 24, 1784. He worked on his father's farm until he was 21 years old, then prepared himself for college at Phillips Academy, Andover, and took his bachelor of arts degree at Yale in 1811.

After teaching for five years in Salem, Mass., he settled in Andover to compile *A Geographical Dictionary* (1817) and *A Gazetteer of the United States* (1818). In 1819 he moved to Cambridge, Mass., where there were better library facilities. There he lived a quiet life, producing reference works one after another for the next 46 years. He brought out *Elements of Geography* (1819), *Sketches of the Earth and Its Inhabitants* (1823), *Elements of History, Ancient and Modern* (1826), and the *American Almanac* (1831–1842), an annual compendium.

Turning his attention to dictionary making, Worcester prepared (1828) a revision of Samuel Johnson's *Dictionary of the English Language* "as Improved by Todd and abridged by Chalmers, with Walker's Pronouncing Dictionary Combined." As a favor to his friend Sherman Converse, Noah Webster's publisher, he compiled an abridgment of Webster's *American Dictionary of the English Language* (1829) and then produced a work of his own, the *Comprehensive*

Pronouncing and Explanatory Dictionary of the English Language (1830). The "War of the Dictionaries" broke out on Nov. 26, 1834, when the Worcester, Mass., *Palladium* published an editorial sharply attacking Worcester for "gross plagiarism" of Webster. Long exchanges of letters were widely reprinted over the country, and the battle between Webster's and Worcester's dictionaries continued to the end of the century. An enlarged work of 1846, *Universal and Critical Dictionary of the English Language*, enhanced his reputation, and conservatives flocked to his side in opposition to the alleged radicalism and Americanism of Webster. A London edition of his last work (1851), with the utterly false description "compiled from the materials of Noah Webster, LL.D.," occasioned many heated pamphlets, especially *A Gross Literary Fraud Exposed* (1853).

Though threatened with a loss of vision in 1847, Worcester continued courageously until he issued his crowning work in a thick quarto, *A Dictionary of the English Language* (1860). His publishers were not as enterprising as Webster's, however, and his work gradually lost out in competition. In 1864, at the age of 80, he brought out a very popular spelling book. He was plodding and unoriginal, but worked patiently and conscientiously in his pursuit of facts. He died in Cambridge, Mass., on Oct. 27, 1865.

ALLEN WALKER READ
Columbia University

WORCESTER, wŏɔs'tər, a historic cathedral town in west central England, in the county of Hereford and Worcester, about 100 miles (160 km) northwest of London. The town is situated mainly on the east bank of the River Severn.

Worcester has been a center of trade and a transportation hub since early times. Glovemaking and cloth manufacture were established in the 13th century, and Royal Worcester porcelain has been made since 1751. The production of Worcestershire sauce began in 1845. Other industries include the manufacture of chemicals, machine tools, clothing, and vinegar. The town lies in the center of a fertile agricultural region whose products include fruits and hops.

The renowned Worcester Cathedral was begun in the 11th century, and construction continued into the 14th century. Other notable buildings include the Commandery, founded as a hostel for travelers in 1085; the Guildhall (1721–1723); and the Victoria Institute, which houses a public library, art gallery, and museum. St. Helen's Church, mainly 15th century, is built on the site of a Saxon church dating from 680.

Worcester Cathedral King's School was founded by Henry VIII in 1541; its premises include the 13th century refectory of a Benedictine priory. Another institution, the Royal Grammar School, dates from 1561. Worcester is the home of the oldest surviving newspaper in the United Kingdom, *Berrow's Worcester Journal*, which has appeared weekly since 1709.

The town's first charter was granted by Richard I in 1189. The first and last battles of the English Civil War were fought at Worcester. Parliamentary forces plundered the town in 1642, and Charles I established his headquarters in the town in 1646. It was captured by the Parliamentarians on Sept. 3, 1651, when Charles II narrowly escaped capture. Population: (1981) 74,790.

WORCESTER, wŏōs'tər, a city in east central Massachusetts, one of the two seats of Worcester county, on the Blackstone River, about 40 miles (64 km) west of Boston. Situated on a series of rolling hills rising from east to west, the city contains a number of small lakes and ponds. Lake Quinsigamond, 7 miles (11 km) in length, marks its eastern boundary. Worcester is the second-largest city in Massachusetts and an industrial and educational center.

The Economy. Worcester's economic base is diversified. It is a major distribution, service, retail, and trading center for central Massachusetts. Manufactures include abrasives, machine tools, heavy machinery, valves, forgings, apparel, data-processing accessories, and plastics. Insurance, banking, education, and research are major employment areas.

Places and Events of Interest. Cultural resources include the Worcester Art Museum, which has a distinguished collection of paintings by Dutch, English, Italian, and French masters, as well as American painters; the American Antiquarian Society, founded in 1812, featuring a large collection of rare Americana; the Higgins Armory Museum; and the Worcester Science Center. Mechanics Hall is a fine concert and lecture facility. The community sponsors a number of concert series, including an annual Music Festival that has been held since 1858. Worcester has several important pieces of outdoor sculpture, including works by Daniel Chester French, Maurice Sterne, Randolph Rogers, and Chaim Gross. There are more than 1,200 acres (486 hectares) of city parkland and a state park within the city limits at Lake Quinsigamond.

Education. An extensive public school system and a separate publicly supported system of vocational secondary schools are maintained in the city. There are also a number of private and parochial schools.

Institutions of higher learning include the College of the Holy Cross, Worcester Polytechnic Institute, Worcester State College, Clark University, Becker Junior College, Worcester Junior College, Assumption College, Quinsigamond Community College, and Central New England College. The University of Massachusetts Medical School is here.

Government. Worcester secured a town charter in 1722, and in 1731 became the seat of a county of the same name. A city charter was granted in 1848. Worcester operates under a council-manager form of government, in which day-to-day administration of city affairs is vested in the city manager and policy-making in the council. In addition to the usual municipal services, the city maintains a hospital, a nursing home, an airport, and a cemetery.

History. After two early attempts had failed (1673-1675 and 1683-1702), permanent settlement was effected in 1713. During Shays' Rebellion, the courthouse was seized and closed. Worcester was a center of antislavery sentiment and Free Soilism from the 1830's through the 1850's. The New England Emigrant Aid Society was established by Eli Thayer in 1854 to encourage settlement of Kansas as a free state. The Republican party of Massachusetts was founded here in 1854. National Women's Political Rights conventions were held in Worcester in 1850 and 1851.

Early economic activity was stimulated by the construction of the Blackstone Canal (1828),

linking Worcester and Providence. More important, railroads to Boston (1835), Norwich (1840), and Springfield with connections to Albany (1839) made Worcester a transportation hub. Extensive manufacturing, particularly of wire, took place in the late 19th century, which in turn stimulated substantial immigration. The population grew from 58,291 in 1880 to 179,754 in 1920, with large numbers of Irish, Canadian, and Swedish immigrants arriving before 1900. They were followed by Italian, Polish, Lithuanian, Greek, Armenian, Syrian, and Lebanese settlers in the first decades of the 20th century. Worcester's population reached a peak of 203,000 in 1950.

Population loss and economic difficulty characterized the 1960's, but by the late 1970's an economic revival took place, including the construction of a major downtown shopping facility and a civic center, Centrum at Worcester, which opened in 1983. Population: of the city, 161,799; of the metropolitan area, 372,940.

JOHN B. ANDERSON
College of the Holy Cross

WORCESTER PORCELAIN, wŏs'tər pŏr'sə-lin, china or porcelain made in Worcester, England, since 1751, when the Worcester Tonquin Manufacture (since 1862 called Worcester Royal Porcelain Company, Ltd.) began producing ceramics in the manner of Chinese porcelains. The factory attained a leading position in its field, its wares setting a standard for technical and artistic excellence.

History. Of 14 partners named in the original deed, Dr. John Wall remained with the company until shortly before his death in 1776, and William Davis, Sr., managed the firm until 1783. Wall's name has been given to the entire period 1751-1783. A long series of new owners, members of the Flight and Barr families, succeeded. The first were Joseph and John Flight, sons of the London agent for the Worcester factory, who bought the property for £3,000. On John's death in 1791, Joseph took Martin Barr as a partner. The firm was called Flight & Barr from 1792 to 1807; Barr, Flight & Barr to 1813; Flight, Barr & Barr to 1829; and Barr & Barr to 1840.

After the Dr. Wall period, a rival firm came into being when the chief Worcester porcelain decorator, Robert Chamberlain, and his brother Humphrey began potting and decorating their own wares. Porcelain production in Worcester was divided between the two firms until 1840, when Chamberlain's absorbed the older company. In 1852, W. H. Kerr and R. W. Binns, as new proprietors, began the second century of Worcester porcelain production under the name Kerr & Company. Finally, the Worcester Royal Porcelain Company took title to the plant and stock as a nucleus for expanded facilities.

The distinctive characteristic of Worcester porcelain was originally a formula incorporating Cornish steatite (soapstone) into the frit paste. An artificial or frit-paste porcelain had been made at Chelsea, possibly as early as 1743, and a formula had been patented by Frye and Heylyn of Bow in 1744. In 1748, Benjamin Lund of Bristol obtained a license to quarry soaprock, and

production of steatite-body porcelain, an English invention, received its initial impetus at Lund's porcelain works about 1750.

Lund's Bristol was the proving ground for Worcester ware, for in July 1752, Benjamin Lund and his associate, William Miller, moved to Worcester with workmen and molds and joined forces with Worcester Tonquin. Chemical analysis shows no dividing line between early Worcester and Lund's Bristol. These wares are distinguishable only by their marks.

Design. The earliest Worcester wares were modest pieces, suitable for the small kilns that prevailed in the first years of production: sauceboats, small butterboats, mugs, and hexagonal vases and pots. A favorite form was a leaf-shaped dish used as a pickle tray. The footed sauceboats and jugs owed their shape directly to metalwork forms. The creamy white fabric was covered with a transparent lead glaze. Molded swags and panel outlines were supplemented by decoration painted either in blue and white or in other colors.

The positive blue of the underglaze painting was peculiar to Worcester and remained a basic decoration. In 1756 the engraver Robert Hancock introduced the use of copperplate engraving on the factory's porcelains, first printed in black and called jet enameled, and by 1759 printed in the blue. The results were so attractive that these transfer-printed wares were sold in great quantity. The subjects were taken from many sources: royal portraits; romantic themes after the paintings of Jean Antoine Watteau, François Boucher, and Nicolas Lancret; English scenes after Thomas Gainsborough and Francis Hayman; and chinoiserie after Jean Pillement.

A change in the formula in 1765 made Worcester ware highly resistant to heat and crazing. Serviceability was the Worcester forte. Figures were made, but only seven subjects have been identified.

Finely black-pencilled scenes and monochrome paintings on pale yellow grounds can be

(Below) The porcelain breakfast plate and cream jug made for Admiral Nelson and Lady Hamilton after they visited the Worcester factory in 1802. (Left) In this century Dorothy Daughtry, carrying on an honored tradition, designed a series of bird figures, like this meadow pipit, which reproduce nature in Worcester porcelain.

WORCESTER ROYAL PORCELAIN COMPANY

dated to the 1760's. Added to Chinese motifs were the Japanese Kakiemon type and Imari patterns. Meissen, in addition to Oriental themes, inspired miniature harbor scenes and delicately tinted German flowers and sprigs. A second phase of the Wall period began in 1768 when a large group of decorators came from Chelsea. They introduced bold and brilliantly colored painting of landscapes, figures, birds, and flowers in stock patterns. The influence of Sèvres became increasingly evident in design and in the use of colored grounds. Salmon-scale grounds, executed in blue, pink, and yellow, were enhanced with gilding. Leaf-gold was ground in honey and applied to the decorated piece for a final firing. In the 1770's, formal panels and patterns regulated the painted flowers.

With the advent of the Flights, a new china-clay and bone-ash body replaced the old stearite formula, and wares were produced that elicited royal orders in 1788 and thereafter. Subsequent production followed the rigidly neoclassical style, with hard mercury gilding, and eventually pursued the sequence of 19th century design.

Among the 20th century Worcester productions should be mentioned the full-round bird figures of the artist Dorothy Doughty. Painted birds sing their minor note all through the 18th century production; the modern bird figures, on botanical mounts, are faithful models of natural specimens.

Marks. From the arms of Walmstry House, site of the porcelain works until after 1840, came the crescent mark used on many 18th century pieces. The great body of Worcester marks includes workmen's and factory symbols, versions of square Chinese marks, Meissen-type swords, Flight marks, and (after 1788) the royal crown. A combined RH with anchor is the rebus mark of Richard Holdship, a principal proprietor in the first decade. The present trademark, registered in 1862, includes earlier elements. It consists of four cursive W's encircling the numeral 51 (the founding date, 1751) and surmounted by a crown.

(Faber and Faber 1966); Banyan, Lawrence, and others, *Worcester Blue and White Porcelain: 1751-1790* (Hutchinson 1981); Sandon, Henry, *Illustrated Guide to Worcester Porcelain 1751-1793* (Seven Hills Books 1980).

WORCESTERSHIRE, wōōs'tar-shir, a former county in west central England. It lay between Gloucestershire on the south, Shropshire and Staffordshire on the northwest and north, Warwickshire on the east, and Herefordshire on the west. Under the local government reorganization of 1974, Worcestershire became part of the new county of Hereford and Worcester, and its industrialized areas in the north were absorbed into the new metropolitan county of Midlands. Chief cities include Worcester, historically the county town; Reddich, known for its manufacture of needles; and Kidderminster, a producer of rugs and carpeting.

The Malvern Hills in the southwest mark the highest elevation in the former county. To the southeast is the escarpment of the Cotswolds, and to the north are the Clent and Lickey hills and the urbanized area of Birmingham and its

suburbs. The River Severn flows through the low-lying region and is joined by the Avon near the Gloucestershire border. The region is famed for its fruit crops, and grows grain and hops.

WORD PROCESSING, the writing, editing, storing, and printing of text electronically. A typical word-processing system has a keyboard, a video screen, a computer with a CPU (central processing unit), and hardware for storage and printing. The most widely used word processors consist of personal computer systems equipped with word-processing software. *Dedicated* word processors are similar systems designed for word processing exclusively.

The main value of word processing lies in the fact that the user can revise text quickly and efficiently. The laborious manual cutting and pasting associated with typewritten copy are no longer needed. Retyping is unnecessary, too. The user can simply print revised text on a printer. Furthermore, revision with word processing is an interactive process. As in sculpturing, the effect of each change is immediately apparent and becomes the basis for any further alteration. A result is that traditional distinctions between writing, revision, and editing become blurred. Displaying ideas on the screen, writing more about those ideas, revising the writing, and editing the revisions become one integrated activity rather than separate tasks.

History. The age of word processing began with IBM's introduction of the Magnetic Tape/Selectric Typewriter (MT/ST) in 1964. The MT/ST was a "semi-intelligent" typewriter that stored typed documents on magnetic tape. Corrections could be made by typing over unwanted text, offering error-free typing at speeds up to 180 words per minute. The term "word processing" was derived from the term *Textverarbeitung* ("text processing"), coined in 1965 at IBM's Office Products Division in West Germany.

An explosion of word-processing technologies occurred during the 1970's as other companies introduced their own word processors. Olivetti entered the market in 1971, and Savin in 1972. These companies were joined by Royal, Xerox, DEC, Lanier, and A. B. Dick in the mid-1970's. "Intelligent" electronic typewriters—with increased memory, more editing features, and greater speed—appeared in the late 1970's. The first was from QYX, a division of Exxon Enterprises, in February 1978; and IBM unveiled its Models 50 and 60 in June of that year.

Magnetic tape and the transistor made possible the birth of word processing, but mass production of microchips, such as the Intel 8080, introduced in 1970, opened the way for computerized word processing. In 1972, Lexitron offered the first word processor with a video display, and Vydec featured the first use of floppy disks with word processing in 1973. Disk-based word processors proved better than tape-based systems, because they could store and retrieve text more quickly.

By the end of the 1970's, video displays, CPUs, magnetic disks, keyboards, and high-speed printers were readily available and made possible the development of stand-alone, dedicated word processors—the basis of modern word processing. In June 1980, IBM introduced its Displaywriter, and Wang offered its Wangwriter in December. In the same month, Sony

announced its Typecorder—a portable, paperless typewriter.

Word processing on microcomputers also emerged during the 1970's. The earliest programs were written in BASIC, ran on 8-bit machines, and displayed only uppercase letters on 40-column screens. One of the first full-featured programs was Electric Pencil, a cassette-based program that later was modified to run under the CP/M operating system. By 1980, popular programs included Apple Writer, EasyWriter, PIE Writer, and Supertext—all for the Apple II computer; Scripsit for the Tandy TRS-80; Wordpro for the Commodore PET; and Select, Spellbind, and WordStar for CP/M computers.

In August 1981, IBM introduced its Personal Computer, which was designed for word processing and other applications. The greater storage capacity and speed of the IBM PC and PC-compatibles promoted the use of word processing with microcomputers and motivated software manufacturers to provide more powerful word-processing programs.

During the early 1980's word processing became increasingly integrated with other information-processing functions, such as the downloading and manipulation of information from remote data banks, the sending of messages electronically, and electronic typesetting. Improvements in laser printing made possible "graphics-quality" printing and spurred interest in self-publishing.

Basic Features of Word Processors. Word-processing programs that run on microcomputers vary greatly in capability and cost. Most programs have versions for different computers, but some are machine-specific—that is, they run only on a particular kind of computer, such as an Apple II, a Commodore 64, or an IBM PC.

Most programs are *menu driven*: the program displays menus from which the user chooses a desired function. Some programs, like WordStar or WordPerfect, are *command driven*: the user can issue a command from the keyboard without first leaving the text to call up a menu. Menu-driven programs are easy to learn but slow to use. Command-driven programs are quicker but work well only after the user has memorized the needed commands. *Mouse-driven* programs, like Microsoft's Word or MacWrite for the Apple Macintosh computer, are operated by means of a small desktop mechanical device (the mouse). The commands can be invoked also from the keyboard.

Most programs have horizontal scrolling as well as vertical scrolling, so that lines longer than 80 characters can be displayed at one time. Most programs also have *word wrap*, a feature that moves to the next line a word that does not fit at the end of the current line. The user, therefore, does not have to press the Return key but can type continuously line after line. Most programs display help messages to assist the user, and some have adjustable levels of help.

Flexible cursor movement is important in word processing. The *cursor* is a flashing mark (often an underscore) that indicates where the user types the next character. Typically, the cursor can be moved by character, word, line, or screen, and to the beginning or end of the file. In some programs, it also can be moved by sentence, paragraph, page, or punctuation mark.

Almost all programs permit typing in either insert mode or replace (typeover) mode. In the former mode, room is made for newly typed char-

acters at the cursor by moving existing characters to the right. In the latter mode, each newly typed character wipes out the cursor character.

The most useful programs have many formatting capabilities, such as horizontal centering of a title or phrase, automatic paragraph formatting, right-justification, hyphenation, indentation, variable tab settings, and variable left and right margins. In the best programs, the format on the screen matches the format of the printed document. This feature is sometimes called WYSIWYG ("what you see is what you get").

The ease with which a user can define and manipulate blocks in word processing eliminates cutting and pasting and encourages revision. A block can be anything from a single character to pages of text. Some programs allow the definition of columns as blocks. A defined block can be moved, copied, deleted, or written as a separate file to the disk.

A powerful, full-featured word-processing program allows searching and replacing to be global (throughout the whole document), either automatic or discretionary (the user decides in each instance whether replacement should occur), backward or forward, and with or without regard to capital letters. Some programs permit searching for a string of characters that is self-contained and not part of a larger string, so the cursor would stop at occurrences of the word "in," for example, but not at "in" in the word "find." The best programs provide numerical specification as an option: finding the *n*th occurrence in a search operation or replacing a string with another string *n* times. Programs of this level of sophistication allow "wild cards" to stand for some or all of the characters in search and replacement strings.

In file control, the best programs can handle large files of text, can save files automatically during editing or let the user quickly save a file and continue editing, automatically create backup files during saving operations, and make it possible to merge files.

Basic printing features include underlining, boldfacing, double-striking, printing or suppressing page numbers, formatting top and bottom margins, editing during printing, and superscripts and subscripts.

Good error-handling is a mark of a "friendly" program. Some programs beep when the user commits an operational error. Most programs display error messages and allow recovery from hardware failures without loss of text. Some programs have an *undo* command that restores accidentally deleted text and some even permit disk swapping during editing. Other friendly features include displaying a "disk-full" warning to prevent file loss through a lack of disk space and displaying a warning if the user tries to exit a program without saving an edited file.

Advanced Features. The most powerful word-processing programs include *windowing* with split screens so that two or more files can be edited simultaneously. Some programs, like Electric Pencil PC with Pencil-ACE, let the user determine the colors of each screen. Advanced formatting features include headers and footers, prevention of widows and orphans, and drawing with lines and boxes.

Macro capability is a powerful feature for automating word-processing operations. A *macro* is a long command made up of a series of commands. When a user initiates a macro, usually

by pressing one key or a two-key combination, the program processes the commands of the series in turn. Macros can transpose characters, words, phrases, sentences, and even paragraphs. Macros are often used to provide a format for a memo, a conventional close for a letter, or a boilerplate paragraph for a contract. Macros can even insert blank lines between the sentences of a paragraph to aid analysis and revision—a technique called *blockbusting*—and then reconsolidate the revised text.

Advanced printing features include print spooling, which makes possible simultaneous printing and editing; proportional spacing of characters; printing of multiple copies; and pausing for text entry during printing.

Other enhancements provided by some programs include math functions, bilingual commands and multilanguage keyboard options, outline capability, table of contents generation, index generation, footnote capability, a built-in spelling dictionary, and encryption.

Choosing a Word Processor. If a person wants to do only occasional word processing at home, an easy-to-use entry-level program may be adequate. Business word processing and professional writers require a more advanced program with features such as merge-print and mailing-list capabilities, the capacity to move and copy large files, macro capability, and a full range of search and replace options.

A person who uses a microcomputer in a corporate environment may want to investigate programs that can exchange files with mainframe computers and dissimilar word processors. A programmer might prefer a word-processing program that can run sophisticated macros with conditional logic and nested statements. A user who wants the feel of a dedicated word processor on a microcomputer should consider a program that emulates a dedicated word processor. If the machine's sole use will be high-volume word processing for a business, a dedicated word processor itself may be the right choice.

Choosing a Printer. Factors to consider in choosing a printer include the quality of printed characters (draft quality, letter quality, or both), printing technique (dot matrix, daisy wheel, ink jet, or laser), speed, method of receiving information from the computer (parallel or serial transmission), durability (light or heavy duty), color-printing capability, noise level, and adequacy of documentation and vendor support. Other features to consider include proportional spacing; superscripts and subscripts; variable pitch, line spacing, and line height; graphics capability; and various font sizes and type styles.

Customizing a Word Processor. Most word-processing programs have installation procedures that allow the user to tailor the program to a particular system. Possible options are choice of color with a color monitor, choice of printer configuration and terminal, and user definition of function keys. Many programs can also be customized by means of macros created with the program itself or with a supplementary "macro processor" or "keyboard enhancer," such as ProKey or SuperKey. Macros enable the user to redefine keys for convenience even to the extent of changing the layout of the whole keyboard, such as from the standard QWERTY pattern to the faster Dvorak layout.

WORDEN, wûr'dən, John Lorimer (1818–1897), American naval officer, who commanded the federal ironclad *Monitor* in its sea battle with the Confederate *Merrimack*. Worden was born in Ossining, N.Y., on March 12, 1818. Appointed midshipman (1834) and commissioned lieutenant (1846), he served at sea and at the Naval Observatory in Washington, D.C. On April 7, 1861, just before the outbreak of the American Civil War, he was sent overland to Pensacola, Fla., with secret orders to the Union naval commander off that port to land the reinforcements that saved Fort Pickens. Believing a return by sea would be an admission of a hostile act, he went by land but was arrested near Montgomery, Ala., and held prisoner of war for seven months.

In January 1862, Worden was ordered to command the new ironclad *Monitor*, and he commissioned it on February 26. The *Monitor* was not a seaworthy vessel, and only Worden's resolution and the loyalty of his crew kept it from being lost on the voyage from New York City to Hampton Roads, Va. (March 6–8). Worden was wounded in the eyes in the famous battle next day between the *Monitor* and the *Merrimack*, and that night he was evacuated to Washington where he received the personal thanks of President Lincoln. (See *MONITOR* and *MERRIMACK*.) Recovering his sight, Worden took command of another ironclad, the *Montauk*, in October 1862 and served in it until April 1863. He twice bombarded Fort McAllister, Ga., on the Ogeechee River and, while under fire of that fort, destroyed the Confederate cruiser *Nashville* farther up the river on Feb. 28, 1863. Returning from this action, his ship was mined, but he beached it beyond range of the fort. The *Nashville*, had it been able to get to sea, could have become another *Alabama*, and Worden took more professional pride in its destruction than in his battle with the *Merrimack*. His last action was in the ironclad attack on Fort Sumter, S.C., on April 7, 1863.

Worden was promoted to commander in 1862 and captain in 1863, both times with the thanks of Congress. He was named commodore in 1868, and served as superintendent of the United States Naval Academy from 1869 to 1874. He was commissioned rear admiral in 1872 and commanded the European Squadron in 1875–1877. On his retirement in 1886, Congress awarded him full pay, and he lived in Washington until his death there on Oct. 18, 1897.

Worden was an able officer and a forceful but modest man whose character impressed both President Lincoln and his own crews. He never used his renown to his own advantage and did not even submit an official report on the famous battle at Hampton Roads until 1869, fearing to reflect discredit on the young executive officer who took command of the *Monitor* after Worden was wounded. He had a low opinion of ironclads as warships but accepted his duty in them willingly and used them to the limit of their capability.

JOHN D. HAYES
Rear Admiral, United States Navy (Retired)

WORDSWORTH, Dorothy (1771–1885), English diarist and sister of the poet William Wordsworth. She was born in Cockermouth, Cumberland, England on Dec. 25, 1771. After her mother's death in 1778, Dorothy lived with a succession of relatives until 1795, when she and William shared a house at Racedown, in Dorsetshire.

Wordsworth's only sister, she is a prominent figure in his poems from the early *An Evening Walk* to the *Tintern Abbey* lines and *The Prelude*, and is the probable original of his "Lucy" and "Emma." From 1795 she was his indispensable housekeeper-companion, remaining with him the rest of his life and even accompanying him on his honeymoon with Mary Hutchinson in 1802. In 1829 she succumbed to an obscure illness (quite possibly a nervous breakdown), from which she never fully recovered, and finally became distressingly senile.

Although Wordsworth printed a few of his sister's poems with his own, her more delicate talent found its fullest expression in her journals. The most elaborate is *Recollections of a Tour Made in Scotland* (1874), which she started soon after returning from a tour with Wordsworth and Samuel T. Coleridge in September 1803 and finished in May 1805. Her miscellaneous diaries kept at Alfoxden (January to May 1798) and Grasmere (May to December 1800, October 1801 to January 1803) range from mere trivia to exquisite landscape effects, lively observations of country life, and poignant personal comments. She was also an excellent letter writer. She died at Grasmere, Westmorland, on Jan. 25, 1855.

F. W. BATESON

Author of "Wordsworth: A Reinterpretation"

WORDSWORTH, William, English poet: b. Cockermouth, Cumberland, England, April 7, 1770; d. Rydal Mount, near Ambleside, Westmorland, April 23, 1850. As the second son of John Wordsworth, steward and electioneering agent to the wealthy and influential Sir James Lowther (later created earl of Lonsdale), and Ann Cookson, daughter of the leading draper in nearby Penrith, William was born into the upper stratum of the provincial middle class, and his speech never lost a distinctive northern burr. He was taught by his sensible mother and learned to read early and voraciously; Henry Fielding's novels and *Don Quixote*, *Gulliver's Travels*, *Gil Blas*, and an abridged *Arabian Nights* were early favorites, and his father made him learn long passages from Spenser, Shakespeare, Milton, and Pope by heart. After short periods at the indifferent Cockermouth school and a "dame's school" at Penrith (staying with his mother at her parents' shop), he went as a boarder in May 1779 to the excellent grammar school at Hawkshead, in the heart of the Lake District, where he remained until October 1787. The mother died in 1778, and the father survived only until 1783, leaving small sums for the five children's immediate upkeep and some £4,000 still owed to him by his unscrupulous employer, which the Wordsworths recovered only from his successor in 1802. Two uncles (Richard Wordsworth and Christopher Cookson) became the children's guardians and reluctantly advanced the money for their education.

Books 1 and 2 of *The Prelude* demonstrate that Wordsworth had a happy enough boyhood during the school terms at Hawkshead. William Taylor, the headmaster, was a poetry lover and a

good scholar with progressive views; he allowed the boys plenty of freedom outside school hours. The holidays, unrecorded in *The Prelude*, were tragically different, especially those spent with the money-conscious Cooksons at Penrith. Writing in the summer of 1787, Dorothy—the one sister and henceforth William's special confidant and ally (she had been separated from her brothers on the mother's death)—described to a friend what life above the shop was like: "We are found fault with every hour of the day by the servants and my grandfather and grandmother, the former of whom never speaks to us but when he scolds, which is not seldom."

Cambridge.—William Cookson, a younger uncle who was at this time a fellow of St. John's College, Cambridge, came to the rescue, and through his influence William obtained a scholarship at St. John's and came into residence there in November 1787. Uncle William's hope was that his nephew would distinguish himself in the college examinations, be elected to a fellowship, and in due course—as in his own case—acquire a fat college living. Unfortunately, though he placed in the first class in the college examination held in December 1787, his later performances in these half-yearly tests were mediocre, especially in mathematics. When he decided to spend his third long vacation (1790) in a walking tour with an undergraduate friend through France, Switzerland, Italy, and Germany, instead of sticking to his books, he gave up any chance he had for a fellowship. He certainly felt no vocation whatever for the Anglican Church. When he had taken his B.A. in January 1791, he settled in lodgings in London, where his elder brother Richard was now an attorney. The law was a possible career, but Wordsworth's secret ambition was to become an officer in the army, and he must have hoped that his share of the money owing from Lord Lonsdale would buy him a commission. (The Carlisle Assizes decided in the Wordsworths' favor in August 1791, but the precise sum to be repaid was left to an arbitrator, and the legal proceedings dragged on.)

William Wordsworth in 1842, the year before he was appointed poet laureate of England.

The Mansell Collection,

France.—To equip himself for a temporary traveling tutorship, Wordsworth went to France in November 1791 to learn the language. It was an eventful moment in the French Revolution and in the young Englishman's private life. A passionate love affair with Annette Vallon, a barber-surgeon's daughter four years older than Wordsworth, began at Orléans and was continued at Blois. At Blois too he was initiated into revolutionary politics by an idealistic officer in the local garrison (the future Gen. Michel Armand Beaupuy). By the end of October 1792, Wordsworth was in Paris, anxious to assist in any way possible the Girondist cause. His illegitimate daughter Anne Caroline was baptized in Orléans Cathedral on December 15, but by then Wordsworth, his funds exhausted, had gone back to London. England's declaration of war on France (Feb. 1, 1793) made a return impossible, and the marriage, on which Annette was certainly counting, did not take place. They were not to meet again until August 1802, soon after the Peace of Amiens and shortly before Wordsworth's marriage to Mary Hutchinson. Later still he contributed, not ungenerously, to Caroline's dowry.

Judged by worldly standards, Wordsworth's early life had been singularly inglorious. Christopher Cookson's grumbles to Richard about his extravagance must have been very galling: "He has had very near £300 since he went to Cambridge, which I think is a very shameful sum for him to spend, considering his expectations," Wordsworth's justification came later, in *The Prelude*—perhaps the most brilliant subjective autobiography ever written. In terms of the *Growth of a Poet's Mind*, as the poem is subtitled, "Residence at Cambridge," "Summer Vacation," "Cambridge and the Alps," "Residence in London," and "Residence in France"—the titles respectively of books 3, 4, 6, 7, and 9–11—undergo a sort of sea change. Even the Annette affair is romanticized into the melodrama of a fictitious Vaudracour and Julia.

Early Verse and the "Annus Mirabilis."—*The Prelude* was not written until 1804–1805, but Wordsworth was already writing poetry of considerable promise in his schooldays. The earliest surviving piece is a set of vigorous Popian couplets on the bicentenary of Hawkshead School. More interesting are the fluent love lyrics (addressed to an unidentified Mary) and the long, part-descriptive, part-Gothic *The Vale of Esthwaite*, all of which date from 1786 and early 1787. *An Evening Walk*, the best of the early poems and the first to be published (in 1793, at the same time as the later and inferior *Descriptive Sketches*), was written at Cambridge and in the long vacations of 1788 and 1789. Though an uneven poem, its vivid descriptions of the Hawkshead district are as fine as anything in James Thomson's *The Seasons*. This boy was the father of the man.

Wordsworth spent the first half of 1793 in London. He had hoped to make his way as a radical journalist and pamphleteer, but his eloquent *Letter to the Bishop of Llandaff* in defense of the execution of Louis XVI, which was written at this time, was much too outspoken to find a publisher. (It remained in manuscript until 1875.) The two poems published in 1793 found few readers (one of them, however, and an enthusiastic one, was Samuel T. Coleridge). A rambling period followed, mainly on foot, in the Isle of Wight, Salisbury Plain, the Wye Valley (including Tintern Abbey), north Wales, and the north

of England. The later months of 1794 were spent in helping and nursing Raisley Calvert, a consumptive friend, who died in January 1795 and left Wordsworth £900. The providential legacy enabled him to make poetry his career, and he set up house with his sister in September 1795 at Racedown Lodge in Dorset. A productive period followed: *Salisbury Plain* (now known as *Guilt and Sorrow*), *The Borderers* (1796), and *The Ruined Cottage* (early 1797, now *The Excursion*, book 1). A dramatic visit by Coleridge in June 1797—they had met briefly in Bristol in 1795—led to a transmigration in July to Alfoxden House, Somerset, to be near the Coleridges at Nether Stowey.

Many of the poems of the *annus mirabilis* (July 1797 to July 1798)—including *The Idiot Boy*, *The Thorn*, *We Are Seven*, and the Tintern Abbey lines, as well as *The Rime of the Ancient Mariner* and three other pieces by Coleridge—were collected in *Lyrical Ballads* (Bristol, September 1798; reissued October in London), with a challenging "Advertisement" (by Wordsworth). On the strength of the 30 guineas, promised by the publisher and their hopes of earning a little as German translators, the Wordsworths spent September 1798 to April 1799 in Germany, sailing with Coleridge to Hamburg and then proceeding on their own to Goslar in Saxony, where they endured four and a half cold and lonely months. Surprisingly, Wordsworth wrote several of his finest poems at Goslar, including most of the early episodes in *The Prelude* and *Nutting*, *Lucy Gray*, several of the "Lucy" and "Matthew" poems, and *Ruth*.

Grasmere and Later Years.—On returning to England, having acquired (unlike Coleridge) only a smattering of German, the Wordsworths spent a long visit with the Hutchinsons, old Penrith friends then in Durham, but by December 1799 they had found a modest house of their own in their beloved Lake District—Dove Cottage, Grasmere, Westmorland (now an excellent Words-

worth museum). A second edition of *Lyrical Ballads* came out in 1801 (dated 1800), with an elaborate "Preface" instead of the "Advertisement" and a second volume containing the Goslar poems and such later poems as *Michael*. A third edition followed in 1802 and a fourth in 1805. Though *The Prelude* was also completed in 1805, Wordsworth would not permit its publication until after his death. With *The Excursion* (1814) it was all that was ever completed of *The Recluse*, a vast philosophical epic Wordsworth had planned, with Coleridge's prompting, in 1798. The shorter Dove Cottage poems were assembled in *Poems in Two Volumes* (1807), which includes *Intimations of Immortality, Ode to Duty, The Solitary Reaper, Resolution and Independence*, and many of the best sonnets. *Poems* (2 vols., 1815) collected most of the shorter poems already published and added others as well as a new critical preface and an interesting supplementary essay.

Wordsworth's Grasmere period—it ended in May 1813 with a move to Rydal Mount—was externally uneventful. He had married Mary Hutchinson in October 1802, and by 1810 their five children had all been born (two died in 1812). In 1813, however, he was appointed official distributor of stamps for Westmorland—the "handful of silver" of Robert Browning's *Lost Leader* (who is known to have been Wordsworth). The apostasy from republicanism had been gradual (Shelley considered the *Thanksgiving Ode*, 1816, in which Carnage was hailed as God's daughter, to be the last straw). In 1842 Wordsworth was given a civil list pension, and in 1843 he became the poet laureate. The last poem, however, with any claim to greatness was the *Extempore Effusion upon the Death of James Hogg* (1835), and there were good sonnets in *The River Duddon* (1820), *The White Doe of Rylstone* (1815), *Peter Bell* (1819), and *The Waggoner* (1819) had all been written many years before they were published.

Criticism.—Wordsworth was a poetic extremist who made few concessions in his best work to his earliest readers' expectations. To Francis Jeffrey of the *Edinburgh Review*, the most vocal of the anti-Wordsworthians, the formula "emotion recollected in tranquillity" offended against all the canons of literary decorum. "This will never do," he pronounced in the first sentence of a scathing review of *The Excursion*. But for a whole generation of English middle-class intellectuals—most notably Coleridge (*Biographia Literaria*, 1817), William Hazlitt (*Lectures on the English Poets*, 1818), and Thomas De Quincey ("Lake Reminiscences" in *Tait's Magazine*, 1839)—Wordsworth's "intense" (subjective) poetry did very well, and by 1820 his admirers had won most of the reviewers and the reading public to their side. At that time only fragments of *The Prelude* had been printed. Matthew Arnold's influential selection, *Poems of Wordsworth* (1879), persuaded the Victorians to prefer the shorter poems. But the trend of later criticism—Émile Legouis' *La jeunesse de Wordsworth* (1896; Eng. tr., 1897), Walter A. Raleigh's *Wordsworth* (1903), A. C. Bradley (1909), H. W. Garrod (1923), Herbert Read (1930), Lascelles Abercrombie's posthumous *Art of Wordsworth* (1952), John Jones' *The Egotistical Sublime* (1954)—has been to *The Prelude* as Wordsworth's supreme masterpiece. It should be read in the 1805 version.

WORK, wûrk, Henry Clay, American songwriter: b. Middletown, Conn., Oct. 1, 1832; d. Hartford, June 8, 1884. A printer by trade, he taught himself music and began to write songs, achieving his first success with *We're Coming, Sister Mary*, composed for the Christy Minstrels. In Chicago, where he had moved in 1854, he met the songwriter and publisher George Frederick Root, who encouraged him to compose Civil War songs. An ardent abolitionist whose father had operated a station of the Underground Railroad, Work produced for the firm of Root & Cady a number of partisan war songs, beginning with *Kingdom Coming* (1861). Its success enabled him to devote full time to composition; after *Babylon Is Falling* (1863) and *Wake, Nicodemus* (1864), he wrote the still well-known *Marching Through Georgia* (1865). Meanwhile he had composed the prototype of temperance songs, *Come Home, Father* (1864), better known by its opening line, "Father, dear father, come home with me now," and sung for many years in the play *Ten Nights in a Bar-room*.

After the Civil War, in spite of the earnings of such sentimental successes as *Grandfather's Clock*, Work suffered financial ruin—first, with the destruction of Root & Cady (including all the plates of his songs) in the Chicago fire of 1871, then with the loss of his savings in a speculative land investment in New Jersey. However, the reestablishment of his publisher in 1875 enabled him to resume his career. The exact number of his published songs is unknown, but totals at least 73.

WORK, in mechanics. See ENERGY—Energy in Mechanics; ENGINEERING TERMS—Work; MECHANICS—Work; POTENTIAL—Potential Function as Measure of Work; POWER.

WORK FUNCTION, Electronic, a numerical quantity approximately equal to the minimum energy required to remove a loosely bound electron from the surface of a solid. The work func-

tion, which is usually expressed in electron volts (1 electron volt = 1.60×10^{-19} joule), is essentially constant for a given solid and is of great importance in thermionic emission, photoemission, and other types of electron emission. In thermionic emission, the energy required to eject the electrons is supplied by heating the solid, whereas in photoemission the solid needs to be irradiated with light.

The Richardson formula, $J \propto T^2 e^{-W/kT}$, gives the current density J of electrons emitted from the surface of a heated conductor in terms of the temperature T , Boltzmann's constant k , and the work function W . The value of W for a given emitter can be determined experimentally from this relation. Obviously, the lower the value the greater the electron emission. Unfortunately, most metals with extremely low values of W have melting points below the temperatures required for appreciable emission.

In photoemission, the value of W for a metal can be determined by noting the lowest frequency ν of the incident light for which emission occurs (called the threshold frequency), and applying the Einstein photoelectric law, $E = h\nu - W$, where h is Planck's constant and E the kinetic energy of the ejected photoelectron ($E = 0$ at the threshold frequency). In the case of nonmetallic solids the photoelectric threshold energy is not equal to the electronic work function. See also QUANTUM THEORY—*The Photoelectric Effect*.

Average values of W in electron volts for some important emitters are: tungsten, 4.54; tantalum, 4.13; thoriated tungsten, 2.6; cesium, 1.93; oxide emitter (a suitable metal or alloy coated with a mixture of barium and strontium oxides), 1.1. The value of W for a given solid varies slightly with temperature and also depends on the crystallographic surface exposed; it cannot be accurately predicted by quantum theory.

KENNETH W. PERKINS

Science Editor, "The Encyclopedia Americana"

WORK PROJECTS ADMINISTRATION (WPA), a former agency of the United States government, created in 1935 by executive order of President Franklin D. Roosevelt as the Works Progress Administration to provide useful public work for needy unemployed persons. It was renamed Work Projects Administration in 1939, when it was placed under the Federal Works Agency. It should not be confused with the PWA (see PUBLIC WORKS ADMINISTRATION). In its eight years of operation it employed about 8,500,000 individuals at a total cost of nearly \$11 billion. The average monthly wage, which varied according to skill and location, was \$54.33.

Sponsored usually by state or local agencies but paid for chiefly by the federal government, the WPA's projects were manifold. Under the construction program 651,000 miles of roads, 125,110 buildings, 78,000 bridges, and many airports, public utilities, and recreational facilities were built or improved. The art project produced paintings, drawings, sculpture, and more than 2,500 murals in public buildings. Writers prepared a number of notable guide books. The theater project developed striking dramatic techniques. Many kinds of musical groups gave thousands of performances. Adult education classes were conducted. Women engaged in sewing, gardening and canning, and school lunch enterprises. Until 1939, the WPA supervised the National

Youth Administration, which found part-time work for youths.

The WPA was praised for its physical accomplishments and its training of workers, but there were criticisms of waste and lack of planning and accusations that workers shirked and malingered. Appropriations were cut in 1939, and building workers struck unsuccessfully against wage reductions. With the approach of World War II, the WPA contributed to the national defense effort by its participation in construction at military installations. The war brought increasing employment, and on June 30, 1943, the agency was terminated.

WORK SONGS. At the end of the 19th century, Karl Bücher, a pioneer theorist on the origin of music, held that work songs were the original type of singing and that rhythm first appeared as a coordinating element for group effort. Although this is an appealing notion, in which there is probably some germ of truth, it was largely rejected as it was discovered that some primitive peoples had no work songs and that others sang songs at work which bore no rhythmic relationship to the task at hand.

Nonetheless, work songs are an old musical type. Where they occur, they often exhibit the song culture of a people in a fundamental form. When a verse, a tune, and a rhythm are joined in such a way that the people of a culture realize the maximal release of energy by singing at work, the song is not likely to change until the activity loses its importance. Thus, for instance, the songs of the porters of the salt works of Trapani, Sicily, retain a system of counting that goes back beyond any record of the salt works themselves. In the same way, the tuna-fishing chanteys used by the Sicilian fishermen hauling up their great undersea nets show strong African characteristics which are discoverable in no other Italian folk music and very probably date back hundreds of years to the time when similar fisheries flourished along the whole North African coast. The stone cutters in Portland Bill, England, still hew out the sandstone to chants that were used about 1700 when the architect, Sir Christopher Wren, was engaged in the construction of St. Paul's Cathedral using Portland stone.

Thus, work songs are more conservative than most other types of folk songs, even though new verses may be improvised continually by the work-song leader. At harvest time in Spain, Italy, and Corsica the threshing is done by driving horses and mules around and around through the newly cut grain while the drivers sing a wailing appeal to the Virgin to keep their mules strong and safe from accidents. The same activity is depicted in ancient Egyptian art, and there is a fragment of an ancient Egyptian text encompassing a point of view that would not seem outlandish to a Mediterranean peasant today.

Work-Bee Songs.—All through peasant Europe and in pioneer America, where wool was carded, corn was husked, and the innumerable tasks of the farm were performed, the people came together in work bees, in which singing played an important part. Young people played games, courted, and picked out their future mates while work songs inspired the group to complete its task. Such songs are still an important part of peasant life in eastern Europe, rural Italy, and among the Basques.

Perhaps the most striking survivals of this

work-bee custom in the West are the so-called waulking songs of the Hebrides in Scotland. The manufacture of wool and tweed of this region was one of the principal activities of women. A suit of heavy tweed protected a man from the rigors of wet and cold as he hunted, fished, and tended his flock in his wintry world. Thus, a stout waterproof length of tweed was the strongest expression of feminine care for a man. In the last stage of tweed making, the women gathered in a cottage to hand-shrink the cloth. They dipped it in a shrinking solution and then rhythmically pounded it on a wooden table and passed it from hand to hand around the work circle. While they kneaded the tweed, they sang songs of erotic and heroic content, the leader giving out the verses and her companions joining in superb unison on the rolling, chanteylike refrain. Even today, when the handicraft of tweed making has almost disappeared, folklorists have recorded hundreds of waulking songs in the Hebrides, and these noble work songs are still sung by the Gaelic-speakers of Nova Scotia at their parties.

In all such songs the singing leader expresses the joint sentiments of his group, and the work-song chorus immediately affirms in its refrain what he has stated. Thus, in the work song one can see the human community in action, making what it needs and at the same time voicing its fantasies and its desires, often in very uninhibited fashion. Indeed, the texts of work songs are often the most frankly erotic of all folk music. In a group of Haitian peasants engaged in preparing a field for cultivation with their hoes, the song leader indulges in the wildest fantasies of erotic humor to keep his comrades amused and heartened. Hardly a word of such text could be printed without shocking most readers. Sicilian sea chanteys concern only one topic—sex; and all collectors of the Anglo-American sea-chantey tradition have confessed privately that the texts of most of these songs must be toned down for print.

Sea Chanteys.—Sea chanteys not only candidly describe the pleasures of sailors ashore, but deal frankly with the character of the officers who commanded the ships and the harsh conditions of work and life on board. The work-song leader voicing the woes of his comrades has apparently long been important in the work-song tradition:

A Yankee ship came down the river,
Blow, boys, blow,
Her masts and spars, they shone like silver,
Blow, boys, blow.
And who do you think was the captain of her?
Old Bully Hayes the devil-driver.
And what do you think we had for dinner?
Monkey heart and baboon liver.

The custom of singing chanteys aboard sailing vessels is very probably prehistoric. Francisco Fabri, a 15th century Venetian friar, aptly sums up the importance of the custom: "There are others who sing when work is going on, because work at sea is very heavy, and is only carried on by a concert by one who sings out orders and the laborers who sing in response."

It was natural that a seagoing nation like England became the home of sailor work songs. Probably the chanteys *Bowline* and *Amsterdam Maid* were familiar to the men who adventured for Queen Elizabeth I. Thereafter, the chantey flourished in the British Navy and merchant marine until about the middle of the 18th century. Shipboard discipline became much more formalized after that time, and no spontaneous singing

was permitted. The independent seafarers of the American colonies kept up the custom, however, and in the 19th century Irish-American and Afro-American chanteymen took over all of the old songs and contributed many new pieces to the tradition. Thus, during almost a century, the sea chantey was thoroughly Americanized, and some of the noblest songs, such as *Shenandoah* and *Johnny, Come Down to Hilo*, spread from American ships to the merchant marine of the whole English-speaking world.

The testimony of the men who drove the clipper ships at a speed no man had sailed before was unanimous on one point: without the enlivening and coordinating melodies of the sea chantey, these ships never could have been sailed at all. The chantey put heart and muscle into men furling a heavy sail in a storm and made it possible for them to match their strength against the wind and the sea. Songs such as *Mobile Bay*, *Hanging Johnny*, *Rio Grande*, and *Whiskey Johnny* became familiar in every port and on every ocean of the planet. No matter how hard and dangerous the passage, no matter how brutal and tyrannical the officers, no matter how rotten and unpleasant the food, the chanteyman could voice the feelings of his mates and knit them together in anger and a common will to survive somehow and drive their vessel on.

There were rhythmic work songs for every shipboard task where concerted group action was necessary, and for the hours off watch in the fore-castle there were splendid ballads of wrecks, sea fights, and pirates to while away the time. Both these types of Anglo-American sea songs deeply influenced the development of the work song in the United States. The sea chantey became a model for Negro longshoremen in the ports along the Atlantic and Gulf coasts, and these slave singers began at once to contribute new verses and new songs to the sea tradition:

Oh, was you ever in Mobile Bay,
Lowlands, lowlands, away my John,
A-screwing cotton by the day,
My dollar and a half a day.

Echoes of this genre are still to be heard along the Georgia coast, where old-time longshoremen sing:

Pay me or go to jail,
Pay me my money down,
Pay me, Mister stevedore,
Pay me my money down.

Forecastle Ballads.—During the War of Independence and the War of 1812 numerous ballads were composed celebrating American heroes like John Paul Jones and relating America's victories at sea. Concurrently whalers, fishermen, and clipper-ship sailors were adapting the British sea-ballad tradition to their own purposes in songs such as:

From Boston Harbor we set sail
When it was blowing a devil of a gale,
With our ring tail set on abaft the mizzen peak
And our dolphin striker plowing up the deep.

We poor sailors standing on the deck
With the blasted rain all pouring down our necks.
Not a drop of grog did he to us afford
And he damns our eyes with every other word.

The harsh conditions of the seamen's life during the early part of the 19th century caused many American sailors to stay ashore and seek their fortunes on the expanding American frontier. In this way the familiar ballads and ballad forms of the fore-castle soon reappeared in the work ballads

of lumbermen, miners, cowboys, lake sailors, and cannallers. For example, the *Sailor's Alphabet*,

A is the anchor that ships from the bow,
B is the bowsprit that puts from the prow,
C is the capstan we merrily go 'round, and
D is the derrick that throws us all down . . .

soon was transformed into the *Lumberman's Alphabet*:

A is for ax you very well know,
And B is for boys that can use them just so,
C is for chopping, and now I'll begin,
And D is for danger that we're oftentimes in.

The sentimental sailor song *Bury Me Not in the Deep Blue Sea* was touched with the melancholy of the lonely cowboy on the Western plains and became *Bury Me Not on the Lone Prairie*. There are numerous examples of ballads that passed through several stages of transformation, from forecastle song to lumberman's song and finally to cowboy ballad.

"Come-All-Ye" Ballads.—The majority of the foregoing American work ballads were modeled on the style of the Anglo-Scots-Irish come-all-ye ballad that sprang up during the 18th century. Such songs were turned out in the tens of thousands by the ballad presses of London, Glasgow, and Dublin to document the lives, loves, and attitudes of the rising British working class. Their simplicity and matter-of-factness caused them to replace the older ballads, such as *Sir Patrick Spens* and *The Douglas Tragedy*, which treated largely of the lives of the upper classes. In America, especially among the freeborn workingmen of the woods and the rivers, the democratic, journalistic come-all-ye became the universal model for song making.

During the period that the American woods tiger cleared the coniferous forests from Maine to Washington, the principal form of recreation during the lonely winter months in the bunkhouses was singing and composing ballads. The life was hard, the work was arduous, and the lumberjack was threatened by danger in the woods, on the skid roads, and on the wild river drives. Some of his ballads seem overly sentimental to us today, but they capture, as no other literature does, the period and the feelings of these men who supplied the lumber for the growth of a young nation:

The choppers and the sawyers, they lay the timber low,
The skidders and the swamper, they holler to and fro,
Next come the sassy loaders before the break of day,
"Come load your teams, my bully boys, and to the woods away."

One of the ballads recounts a hauling contest between two teams of oxen:

Not a thing on the river McClusky did fear,
As he swung his gourd stick o'er his big, spotted steers,
They were round, plump and handsome, girtin' eight feet and three,
Said McClusky the Scotchman, "They're the laddies for me."
Then along came Bull Gordon, whose skidding was full,
As he hollered, "Woah, hush," to his little brown bulls,
Short-legged and shaggy, girtin' eight feet and nine,
"Too light," said McClusky, "to handle our pine."

The most popular of these songs and the model for the most frequent type was *The Jam on Gerry's Rocks*, which recounts the death of a heroic young riverman during a log jam. Although many old lumberjacks swore they knew the very spot in the river where the fatal incident occurred, researchers have never been able to locate Gerry's

The Bettmann Archive

The dangerous life of the lumberman was reflected in the melancholy ballads he composed and sang about his work.

Rocks or discover any more facts than those recounted in the ballad itself. In truth, the ballad—a fantasy about a sympathetic hero—and its discovery in Ireland and Scotland indicate that its appeal lies more in fantasy than in reality.

Perhaps the function of the majority of these work ballads was to voice the valid complaints of the men about the hard conditions of their lives. One song was sung with equal relish by the woodsmen of Maine, Michigan, and Canada:

To describe what we have suffered is past the art
of man,
But to give a fair description, I will do the best I
can;
Our food the dogs would snarl at, our beds were
in the snow,
We suffered worse than murderers in Canady-i-o.
Our hearts were made of iron and our souls were
cased in steel,
The hardships of that winter could never make us
yield;
Field, Phillips and Norcross, they found their match
I know
Among the boys that went from Maine to Canady-i-o.

This ballad was recreated and given an epic grandeur by the buffalo hunters of the stake plains. When John A. Lomax brought *The Buffalo Skinners* to the attention of George Lyman Kittredge, founder of American ballad research at Harvard University, Kittredge declared it the finest

American folk ballad; yet, true to the come-all-ye tradition, it was in essence a remake of the lumberjack song:

Our hearts were 'cased in buffalo hocks, our souls
were 'cased in steel,
The hardships of this summer, they surely make
us reel,
In skinning them damned old stinkers, our lives they
had no show,
For the Indians waited to pick us off on the range
of the buffalo.

Cowboy Songs.—Isolation has often played an important part in the development of a new branch of folklore. It was, perhaps, the most important factor in the growth of the large literature of cowboy songs discovered by Lomax in his research, sponsored by Harvard University, during the first years of the 20th century. The cowhands lived most of the year on lonely ranges, banding together for cattle drives across the vast and empty stretches of the Western plains, or coming together for brief periods of jollification, at such centers as Abilene, Kans., or Cheyenne, Wyo. Their cultural origins were diverse; Southern mountaineers, ex-lumberjacks, expatriate Englishmen, Irish navvies, desperadoes, Mexicans, Negroes—such were the components of the cowboy melting pot. In their diverse styles, their songs and ballads reflect this human vitality. Some were parodies of music-hall songs; others were reworkings of English ballads and well-known American folk songs from the East; one or two show French Canadian influence; the major type belongs to the come-all-ye strain. Their heroes were brave cowboys, faithful and agile cow ponies, and the ever-present little dogies—the orphan calves that moved along at the tail of the herd.

Cowboy songs described in tragic, sentimental, and humorous fashion the dreary life of the cowhand and the conditions and adventures of his work. A pervasive theme is the loneliness of a male who has turned his back on his family and all normal society for the solitude of the plains

Loneliness was a common theme in the songs of the cowboys who drove their herds across the western plains.

The Bettmann Archive

and an entirely masculine society. Perhaps the most typical, as well as the most evocative, of all cowboy songs is the cattle lullaby *Git Along, Little Dogies*. In its original Irish form, the song satirizes an old man married to a gay young wife who leaves him at home to rock the baby while she goes out to dance. He mournfully speculates on the paternity of the child in his arms. The cowboy transforms the baby into the dogie, which he often carried on the pommel of his saddle, and links his fate with that of his charge in a mournful chorus.

Whoopee-ti-i-o, git along little dogies,
It's your misfortune and none of our own,
It's whoopin' and cursin' and damnin' those dogies
To their soul's perdition and none of our own.

Labor Songs.—Songs about work have been discovered for a wide range of activities. The forty-niners had their songs, as did the copper miners, the lake sailors, the canal boatmen, and the miners of hard and soft coal in Kentucky and Pennsylvania. George G. Korson has collected a large literature of topical ballads in the American coalfields, which present a picture of the miner at work, at play, and on strike. As the American movement to the West became more and more industrialized, a new note of militancy appeared in these topical songs. The Industrial Workers of the World (IWW), the so-called Wobblies, capitalized this sentiment in their organizing songs, many of them composed by the now legendary Joe Hill. These songs, compiled into a little chapbook called *The Red Song Book*, were known to all the wandering workers of the West during the period before World War I and proved tremendously effective in their organizing drives. This new strain of topical songs from the militant working class again and again produced new batches of local ballads during the 1920's and the years of the depression. The tenant farmers of Arkansas had their song literature. The embattled soft-coal miners of eastern Kentucky discovered a number of bards in their midst, notably Aunt Molly Jackson, who rhymed their cause into rough but strong ballad poetry. The violent years of the textile workers' union in the South Atlantic states—the late 1920's and the early 1930's—gave rise to another batch of strike poetry. All of this material served its local usefulness, was circulated by word of mouth, and has subsequently been reprinted in various publications such as *The Peoples' Song Book*.

American Negro Work Songs.—By far the richest veins of American work songs, however, are the rhythmic work chants of the American Negroes. A number of travelers in the low-lying coastal regions of the Atlantic states and in Mississippi in antebellum days were deeply impressed by the paddling songs of the Negro slave crews who transported them from place to place. These wild and, to the ears of their European listeners, barbaric chants seem to have been closely related to African work songs. The melodies that have been preserved are among the most exotic discovered on the North American continent. This tradition seems to have survived to some extent in the longshoreman chants of Charleston, S.C., and Savannah and Brunswick, Ga. Fortunately, Mrs. Maxfield Parrish organized a group of singers on St. Simons Island, Ga., who knew how to sing some of these primitive American work songs. They are to be found in her book and were recorded in 1962.

These Sea Island songs are characterized by

complex rhythms, by an antiphonal linking of leader with chorus, and by the regular use of some intervals which are more reminiscent of African melodies than of European. Their form is typical of the majority of American Negro work songs. The leader initiates a half line:

LEADER: Kneebone, didn't I call you?
 CHORUS: (overlapping the leader's last note):
 Oh, Lawd, kneebone!
 LEADER: (overlapping the chorus' last note):
 Called you in the morning!
 CHORUS: (overlapping): Oh, Lawd, kneebone bend!

United by this rhythmic chant, the work gang heaved together at the same instant and, by these spaced concentrations of energy, moved a huge timber into place in the hold of a lumber schooner. The leader improvised verses to suit the mood of the moment and the events of the day, keeping the men diverted from the heat, the dirt, and the weariness of the job. Between pulls the men had a moment to relax all together, and a strong group emotion fused them into a unit for the moments of exertion. Thus, formidable tasks were accomplished in a fashion common to all West African cultures. Slave owners recognized the importance of work songs; frequently talented slaves were selected to do nothing but sing while their companions worked and joined in the chorus. Thus, the grueling labor of clearing the land of the South and cultivating it was lightened for generations of toiling slaves by ax songs, cotton-picking songs, cane-cutting songs, plowing songs, corn-husking songs—in fact, by songs for every type of group labor—composed by unknown work birds.

There can be no question that, without these songs for group labor, the big jobs of opening up the South would not have been accomplished. The levees along Southern rivers were built largely by Negro mule skimmers, who handled teams of mules dragging heavy steel scoops. These highly skilled levee camp workers sang all day at their work, their high, wailing voices rising through the dust and heat as they rhymed out their sorrows and their ironic observations about life and love. These levee camp hollers were most common in the Mississippi delta, and it seems very likely, from their melodic shape, that they were the raw stuff out of which the now famous American Negro folk blues developed. Typical verses

I looked all over the whole corral,
 I couldn't find a mule with his shoulder well.
 I asked my captain to give me a dime,
 He said, "Sorry, old bully, you're a dime behind."
 I asked my captain when the money would come,
 He said, "The river is foggy and the boat won't run."

Both road building and, especially, railroad construction developed special Negro work-song types of their own. Until the 1930's, the construction gangs on every Southern railroad sang for each separate operation in laying a road—pick-and-shovel songs for the right of way, tie-toting chants, steel-calling chants for dumping the heavy rails, tie-tamping songs for packing the gravel around the ties, track-lining songs for aligning the track, and spike drivers' songs for spiking the rails home to the ties. All railroad work songs are signalized by a special mood of tenderness and gentle irony, as in the following couplets:

Matty and the baby layin' in the shade,
 Figurin' and studyin' on the money I ain't made.
 You fool the captain and I fool the straw,
 But the general road manager, he's gonna fool us all.
 Railroad workers were better paid and better

treated and had more independence than the generality of Negro labor during the 19th and early 20th centuries, and this fact is reflected in the mood of their work songs. A heroic note, new to the South, began to be heard in their verse. The spike driver, swinging his hammer in flashing arcs over his shoulder, sang:

When you hear my hammer fallin',
 Steel's runnin' like lead, Lawd, Lawd,
 Runnin' like lead.

This old hammer killed John Henry,
 Can't kill me, Lawd, Lawd,
 Can't kill me.

In these lines we find probably the earliest reference to America's earliest work hero, John Henry, the steel-driving man. John Henry probably stands for Mr. Anonymous. Little John was an English folk hero. 'Ti Jean appears as the hero of folk tales in France, Canada, and Haiti. Ol' John played tricks on his slave master in many a slave folk tale. John Henry, according to the legend in the 1870's, matched his strength against the first automatic steam drill, won the contest, and died of overwork, immortalizing the lines:

A man ain't nothin' but a man,
 Before I'd let your steam drill beat me down,
 I'd die with my hammer in my hand.

His ballad has been found among Negroes and whites everywhere in the South and, with the rising popularity of folk songs, has become a national song that is still growing.

Chain Gang Songs.—During the cruel years of Reconstruction, the old slave system perpetuated itself in forced labor drafts, by means of which state roads were constructed and huge plantations farmed. Any Negro who got into trouble was headed for the chain gang, an institution that could be found in every Southern county and state between 1870 and 1930. In most of these prison camps even the simplest care once exercised by the slaveholders was abandoned. A prisoner who died was easily replaced by a new one. The men worked from "can to can't—from when you can see in the morning till when you

Negroes imprisoned on chain gangs found that rhythmic work chants seemed to ease their burdens.

The Bettmann Archive

can't see at night." Food was the crudest:

You wake up in the morning,
You hear the ding-dong ring,
You go marching to the table,
See the same damn thing.

The guards were often sadists:

You kicked and stomped and beat me, kind captain,
And you call that fun, sir.

The slogan was, "Kill a mule, buy another; kill a Negro, hire another." Hundreds died of sunstroke, overwork, and brutality:

You oughta been here in 1904,
You could find a dead man on every turn row.

Go down, Ol' Hannah [the sun],
Don't rise no more,
If you rise in the mornin',
Set the world on fire.

Out of this human hell rose the voices of men who could look death in the face every day and defy it in laughing, ironic lines:

Cap'n got a pistol and he wanna play bad,
Gonna take it in the mornin' when he makes me mad.

Ain't but the one thing I done wrong,
Stayed in Mississippi just a day too long.

The thoughts of these men locked away from the world often by a double life sentence usually turned on the women whom they missed by night and day:

"Yonder comes little Rosie."
"How in the world do you know?"
"I know her by her apron
And the dress she wore.
Umberreler on her shoulder,
Piece of paper in her hand;
She's come to tell the captain:
'Lawd I wants my man.'"

For the convicts who still kept their spirit, there was only one decision—when to run out from under the rifles of the guards:

Every mail day I gets a letter,
"Son come home, son, come home,"
I'm gonna bust right past that shooter,
I'm goin' home, babe, I'm goin' home.

Their heroes were John Henry; Stewball, the magic racehorse whose feet were shod in gold; the Old Grey Goose, who couldn't be killed; Stagolee, the Memphis gambler and gunman; Po' Lazarus, who ran off with the camp payroll; and Long John, who could outrun anything moving:

Ol' John made a pair of shoes,
The funniest shoes that were ever seen,
Had a heel in front and a heel behind,
So you couldn't tell where that boy was gwine.

He's long gone, like a turkey through the corn,
He's gone, gone.

This prison-song literature is touched here and there with epic grandeur. The melodies are as powerful and deeply moving as the best of the spirituals. One singer said, "We starts singing early in the morning, and when we look around, it's dinner time." These songs kept the hearts of thousands of men alive and whole during conditions that match those of the Nazi concentration camps of World War II. They stand for the noble and dauntless spirit of men everywhere.

WORK-STUDY PROGRAM, a plan by which students, usually at the college level, alternate periods of on-campus academic study with periods of full-time, paid employment. The program originated in the School of Engineering at the University of Cincinnati. See also BUSINESS EDUCATION; VOCATIONAL EDUCATION; and the Index entry *Work-Study Program*.

WORKMAN, Fanny Bullock, American explorer and mountain climber: b. Worcester, Mass., Jan. 8, 1859; d. Cannes, France, Jan. 22, 1925. Daughter of Gov. Alexander Hamilton Bullock of Massachusetts, she married (1881) a prominent physician, William Hunter Workman (1847-1937), with whom she traveled in Europe, North Africa, and the Far East. From 1899 to 1912 they explored and mapped parts of the Himalaya and Karakoram ranges, making several first ascents of peaks over 20,000 feet. In 1906, Mrs. Workman established on one of the peaks of Nunkun in Kashmir a world's record ascent for women (23,300 feet). The Workmans collaborated on eight books of travel, notably *In the Ice World of Himalaya* (1900); *Ice-Bound Heights of the Mustagh* (1908); *Peaks and Glaciers of Nun Kun* (1909); *The Call of the Snowy Hispar* (1910); and *Two Summers in the Ice Wilds of Eastern Karakoram* (1917).

WORKMEN'S COMPENSATION, payment of benefits to injured employees or to dependents of those killed at work, regardless of fault. The laws of individual states of the United States vary. Some apply only to those in hazardous work; others apply only where employees are not less than a specified number. See also SOCIAL SECURITY—U. S. Developments.

WORLD, in the most comprehensive sense, the universe, including the earth and the heavens; in a more restricted sense, the earth and its inhabitants. For a discussion of the world in the first sense, see the article UNIVERSE. The present article deals with the subject in the second sense—the earth as the habitat of man. For a discussion of the earth as part of the solar system, see EARTH.

The earth as the habitat of man presents two kinds of environmental elements: physical and biological. Among the physical elements are continents and oceans, weather and climate, landforms, soils with the rocks from which they are derived, and water. The biological elements include flora, fauna, and the peoples of the world. None of these, either physical or biological, exists alone, unrelated to the others. In recurring combinations, they form a sort of mosaic of major geographical regions that is the world. In the following discussion, the physical environment is considered first, and then the biological environment.

PHYSICAL ENVIRONMENT

Continents and Oceans. The earth approximates a sphere in shape, but is somewhat flattened in the polar regions. The diameter from North to South Pole is 7,899.99 miles; halfway between the poles, it is 7,926.68 miles. Furthermore, the face of the earth is far from uniform. The solid crust sags inward in some places and bulges out-

Only 29 percent of the earth's surface is land; the rest is covered by water.

ward in others. In the sags, water covers the solid crust, forming oceans and seas; the bulges rise above these waters as continents and islands. Both sags and bulges are of varied size and are irregularly arranged. All of the sags are interconnecting, so that the bulges are separated and are entirely surrounded by water. The distribution of land and water is the world's basic physical feature.

Only 29 percent of the surface is land. Largest of the land masses is that which includes Europe, Asia, and Africa. Traditionally called separate continents, they are actually one huge land mass broken only by a man-made waterway, the Suez Canal. This land mass, with adjacent islands, constitutes 57 percent of all the land area. Second largest is the land mass that includes North and South America and the narrow connecting land bridge of Middle America, broken only by the Panama Canal. This land mass is just under half the size of Europe-Asia-Africa. Third is the ice-covered continent of Antarctica, centered on the South Pole and constituting 9 percent of the world's land area. The smallest land mass of continental size is Australia, with 5 percent of the land area. Thus, nearly all of the world's land area, 57,225,000 square miles, is included in four land masses with their adjacent islands. See also **CONTINENT**; and articles on the individual continents.

Water covers 71 percent of the surface. West of the Americas, east of Asia and Australia, and north of Antarctica lies the Pacific Ocean, largest and deepest of the world's water bodies, covering about 64 million square miles. If all the land area of the world were fitted into the Pacific basin, a water area larger than Antarctica would still remain. The Pacific opens eastward into the Atlantic Ocean between South America and Antarctica. Separating the Americas from Europe-Asia-Africa, the Atlantic is half the size of the Pacific. Between Africa and Antarctica, the Atlantic leads to the Indian Ocean, which lies between Africa, Asia, Australia, and Antarctica. One tenth smaller than the Atlantic, the Indian Ocean is larger than any of the world's land masses except Europe-Asia-Africa. Centering on the North Pole and opening southward to both the Pacific and Atlan-

tic is the smallest of the world's oceans, the Arctic. Only slightly larger than Antarctica, it is mostly ice-covered throughout the year.

Oceans indent continental shores to form many bodies of water, almost surrounded by land, known as seas. The largest of these is the Mediterranean (965,000 square miles), which with its eastward extension, the Black Sea (173,000 square miles), forms the traditional break between Europe and Africa and between Europe and southwestern Asia. Other large seas include the Bering (878,000 square miles), between Alaska and Asia; the Caribbean (750,000 square miles), indenting southeastern North America; the Sea of Okhotsk (590,000 square miles), on the northeastern Asiatic coast; and the Sea of Japan (400,000 square miles), between the Japanese islands and the Asiatic mainland.

See also **OCEAN, THE**; and articles on individual oceans and seas.

Weather and Climate.—The earth's surface lies under a thick blanket of atmosphere which makes life as we know it possible. It provides relatively narrow temperature ranges in which man, other animals, and plants can exist, and it makes available water, upon which all life depends.

The atmosphere is a mechanical mixture of gases with finely divided solid impurities: 78 percent of the volume of dry air is nitrogen and 21 percent is oxygen; the remainder includes several inert gases and a small proportion (about 0.03 percent) of carbon dioxide. Oxygen is necessary for all living things in the cellular oxidation of food, which releases energy. Carbon dioxide is essential for plant growth. The proportion of elements remains relatively fixed in the lower atmosphere; only at heights over 40 miles is there appreciable change. There is less available oxygen and carbon dioxide as height increases, because the particles of all gases are more widely separated from one another.

Water vapor and solid impurities are present in the lower atmosphere, varying in amount from place to place and from time to time. At a maximum, water vapor approaches 4 percent of the air by volume; at a minimum, it is almost entirely absent. Solid impurities include microorganisms,

Wide World

This photo was sent by Tires 7 on June 20, 1963 from a height of 450 miles. The curvature of the earth can be seen, as well as the constantly changing atmosphere.

chemical salts, smoke, and dust. Even the finest particles are effective in promoting moisture condensation and precipitation.

The atmosphere is a mobile and constantly changing body. Because of this and because of the earth's motions as a planet, weather varies both in place and time, creating many different climates. Weather means the state of the atmosphere at a given place and time, while climate is the average state of the atmosphere at a given place over a considerable period of time. Weather can be observed directly; climate can be determined only from past records. Yet, climate does imply expected weather types and provides a measure of differences and similarities from place to place. The general climatic pattern is modified locally by latitudinal position, detailed arrangement of land and water, size of land mass, altitude, and surface relief.

Low Latitudes.—From 0° to 30° latitude, the outstanding climatic characteristic is the absence of a cool season or winter. Temperatures are always high; although they rarely reach 100° F., they seldom fall below 60° F. Often the temperature difference between day and night is greater than that between the averages of the warmest and coolest months. There are three principal patterns of precipitation. Along the equator and east coasts, precipitation is heavy and evenly distributed throughout the year. Farther from the equator and inland from east coasts, it is heavy in the warmer part of the year, but there is drought during the cooler part. Between these extremes are areas with enough rain during the warmer season so that, even though a dry period occurs, there is no drought. Climate with precipitation throughout the year is the *tropical rain forest* type; that with rain in one season and drought in the other is the *savanna* type; that with a dry season, but no drought, is the *tropical monsoon* type.

Still farther from the equator and east coasts, the range of temperature between the warmest and coolest months becomes greater, and the dry period becomes longer and drier. Eventually, *semiarid* and *arid* climates are encountered. Dry climates occur along continental west coasts be-

tween 20° and 30° latitude, reaching inland and poleward to continental interiors in the middle latitudes. The hearts of these zones are the driest areas in the world, while the outer fringes are semiarid, giving way to humid conditions poleward and toward each coast.

Middle and High Latitudes.—In middle latitudes (30° to 60°), flanking the dry interiors there are areas of moist climates which have in common marked temperature seasons. East of the dry interiors are areas of *humid subtropical* or *subtropical monsoon* climate. The former have mild winters, hot summers, and plentiful precipitation throughout the year; the latter have similar temperatures, but with summer rain and winter drought. West of the dry interiors are areas of *Mediterranean* and *mid-latitude marine* climate. Mediterranean climate has mild winters, either warm or hot summers depending on location close to the coast or inland, and precipitation concentrated in winter, summer being a drought season. Mid-latitude marine climate has mild winters, warm to cool summers, and plentiful precipitation throughout the year.

In higher middle latitudes and high latitudes (60° to 90°) in the Northern Hemisphere, northward from the mild-winter and dry climates is a belt, narrow at the coasts and wide in the interior, of *humid continental* climate, characterized by severe winters. On the southern margin, summers are hot but become progressively cooler and shorter northward. Precipitation is plentiful and evenly distributed through the year except in the interior, where it is concentrated in summer. Severe winter climates do not occur in the Southern Hemisphere because there are no land areas large enough to produce great temperature ranges in these latitudes. The Arctic and Antarctic areas have *polar* climates, whose significant feature is the absence of a really warm season or summer.

See also ATMOSPHERE; CLIMATE; CLIMATOLOGY, APPLIED; METEOROLOGY; RAINFALL. WEATHER.

Landforms.—The earth's crust has been broken, warped, wrinkled, and eroded into an immense variety of shapes. These landforms may be large or small, complex or simple. Locally, detailed landforms are highly significant in determining habitat quality, and major landforms provide guidelines to the world pattern. Major landforms are mountains, plateaus, plains, and hills. Each continent has a distinguishing landform distribution.

Mountains surround the Pacific Basin. The Aleutian Islands of southwestern Alaska represent peaks of a submerged mountain belt which continues through southern Alaska, western Canada, and into the western United States. After a short break, mountains continue through Middle America and southward through western South America. After another break, the mountains, nearly entirely covered by ice, cross Antarctica. With many breaks, partially drowned mountains, reappearing first in New Zealand, form island arcs along the east coast of Asia and back to the Aleutians. Other mountains exist on the Europe-Asia-Africa land mass, radiating in three belts from the Pamir mountain node, where Pakistan, Afghanistan, China, and the USSR come together. One stretches westward through southern Europe, ending in the Atlas Mountains of northwestern Africa; one stretches generally eastward between India and China, then southeastward through Indonesia; the third reaches northeastward into

Siberia. These belts contain many individual ranges and are broken in places by lowland passages. See also MOUNTAINS; LAND BRIDGES ACROSS THE OCEANS.

Enclosed within the mountains, flanking them, or lying somewhat removed from them are the world's major plateaus, relatively high and smooth surfaced in contrast to the steeply sloped mountains. In Asia, the Tibetan, Iranian, and Anatolian plateaus are all nearly enclosed by mountains; the Deccan of India and the Arabian Plateau lie close to mountains rather than within them. So much of Africa is tableland that it is often called a continental plateau. In western North America, plateaus occupy the area between the Pacific coastal mountains and the Rockies, and between the eastern and western sierras of Mexico. In South America, much of Brazil and Uruguay is plateau, as is southern Argentina. Antarctica and Greenland are essentially plateaus of ice. See also PLATEAU.

Plains are low-lying, nearly level tracts of land—the most productive and most densely peopled parts of the world. Between the higher and rougher lands of eastern and western North America, plains reach from the Arctic to the Gulf of Mexico, with eastward extensions to the lowland of the St. Lawrence Valley and along the southeastern coast northward to New York. In South America, a narrow plain reaches up the Amazon and, widening, extends southward between the Andes and the Brazilian Plateau into northern Argentina. A third extensive plain stretches from western Europe eastward, widening into central Siberia. Many smaller plains occupy areas between mountain and plateau, fill hollows on plateau surfaces, or occur as coastal fringes. See also PLAIN.

Hills are rough lands, less high and less rugged than mountains. They occur primarily along mountain and plateau fringes, or as remnants of long-eroded mountains or plateaus of the geologic past. In a sense, they form the "filler" between other major landforms.

See also PHYSIOGRAPHY.

Rocks, Minerals, and Soils.—The earth's crust is composed of rocks, all of which are composed of minerals. These in turn are composed of chemical elements, either singly or in combination. The three major rock types are igneous, sedimentary, and metamorphic. Igneous rocks have crystallized from a molten or partially molten mass. Sedimentary rocks are composed of particles accumulated by erosion and deposition, and are usually laid down in ocean basins. Metamorphic rocks are those that have undergone a marked change from their original state, as a result of heat and pressure or the action of underground water.

Rocks exposed to the atmosphere are weathered and eroded. Weathering is the natural breaking up of rocks either physically or chemically. As finer and finer particles are produced, the formation of soil begins. Water sinking into the ground performs two major actions: leaching and eluviation. Leaching is a chemical action: soluble minerals are dissolved from the upper part of the rock debris and carried downward, to be re-deposited or carried away by underground seepage. Eluviation is a physical action: very fine mineral particles are carried downward from the surface layer. These processes, over long periods of time, create a surface layer which is coarse textured and poor in soluble minerals, and a lower layer, compact and relatively rich in minerals.

Another element in soil formation is the accumulation at the surface of organic matter from plants and animals. This deposit, in partially decomposed form, is carried downward, providing an organic element in the soil.

After a long period of development, soil reflects climate rather than the type of rock from which it was produced. There are, thus, soil zones similar to climatic zones. Local departures from the broad pattern occur in places where normal soil formation is interrupted or is incomplete.

See also GEOLOGY; MINERAL WEALTH OF THE WORLD; MINERALOGY; ROCKS; SOIL.

Water.—Man's use of the world's lands depends in major degree upon the availability of water for domestic use, industry, irrigation, power development, transportation, production of food and raw materials, and recreation. Rivers and lakes provide water for all of these needs; underground water adds materially for some.

When precipitation occurs, part is reevaporated, part runs off the surface, and part sinks into the ground. Reevaporated water maintains some of the vapor content of the atmosphere, from which all precipitation is derived. That which runs off the surface forms rivers and lakes. That which sinks into the ground maintains a water reservoir for plants and man.

Water moves downward into the earth's crust under the influence of gravity, filling spaces between rock particles and cracks and fissures in bedrock, to become groundwater. Where all the spaces are filled is the zone of saturation. The top of this zone is the water table, which follows approximately the profile of the land above it, closer to the surface in low places and deeper below in high places. It is closer to the surface in humid than in dry areas. Where the water table intersects the surface, springs are formed. In surface hollows, swamps or lakes may develop. By digging from the surface to intersect the water table, wells may be made. Between the water table and the surface is a zone in which the spaces are alternately wet and nearly dry. Water in this zone provides moisture for plants.

Artesian water differs from ordinary groundwater. It is water trapped in a dipping coarse-textured rock layer which is capped by an impervious layer. Water soaking into the porous layer where it is exposed at the surface builds up pressure because the impervious capping layer prevents escape. When a break is made in the impervious layer, pressure forces water to or toward the surface. See also ARTESIAN WELLS.

The abundance or paucity of available water is closely related to climate except for artesian systems. In humid climates, streams and lakes are numerous, and groundwater is usually plentiful; in dry climates the reverse is true.

See also HYDROLOGY; LAKE; RIVERS; WATER SUPPLY; WATERWAYS OF THE WORLD.

Major Geographical Regions.—The concept of geographical regions arises as an attempt to "leave together" those features which actually occur in combination, giving a distinctive quality to each part of the world. A geographical region is an area in which there is some conspicuous unity of environment, resting either predominantly on one element or on a combination of several. This does not mean that the distribution of environmental elements is exactly uniform throughout a given region. It does mean that there is a coincidence or strong correspondence in the distribution of most of the elements, and that there is an extensive core

The contour of the valley floor determined the path this road would follow in east-central Mexico.

American Airlines

area within which the similarities are greater than the differences. Names of regions usually reflect the dominant element.

There are many schemes of world regional division. All have certain similarities; none can be considered final and unalterable. Because of the variety that exists and the changes that constantly take place in both physical and biological elements, rigid categorization is neither accurate nor desirable. One of the most usable schemes is that proposed by Preston E. James, who identifies the following types of broadly similar landscapes: dry lands, tropical forest lands, mediterranean scrub forest lands, mid-latitude mixed forest lands, grasslands, boreal forest lands, polar lands, and mountain lands. The first seven are based primarily on natural vegetation; the last includes all mountainous areas. They offer a framework for observing and describing variety and change throughout the world, and can be subdivided further to express the degree of detail desired.

BIOLOGICAL ENVIRONMENT

Flora.—The flora of the world is highly diversified, varying in its composition according to latitude, altitude, climatic conditions, and past geologic events. The flora of any one area represents the surviving elements of the many plant populations that have followed one another through the various geologic periods. Many different plant formations are recognized on the earth's surface. Only the major ones are considered here. Within any one formation, there may be variations whose appearance is due to special climatic or geologic features.

Tundra.—The tundra extends northward from the tree line to the areas of perpetual snow and ice, and is similar in North America, Eurasia, and at higher mountain elevations. Sedges, rushes, lichens, mosses, low-growing shrubs, some grasses, and flowering herbs characterize the tundra. Seed germination is poor, and most plants require several years to produce their first flowers; thus most are perennial, and reproduction by vegetative parts of plants is important. Because of a perpetual cover of ice and snow, very little tundra is found in the Antarctic region. See also TUNDRA.

Coniferous Forest.—These forests are largely confined to the Northern Hemisphere and are found across Canada and Eurasia, and at higher

elevations in mountains. The boreal forest of North America extends across southern Canada to the northern Rocky Mountains, north into Alaska, and south into the Appalachians. The principal trees found in these forests are various species of pine, spruce, fir, and hemlock; the composition varies with the latitude, altitude, and other factors. Alder thickets are often found in wet areas, heath shrubs in openings; varying-sized stands of quaking aspen, paper birch, willow, and tamarack are often present. Northward, the forest trees decrease in height and density, and lichens and mosses increase in depth and extent, interspersed with bogs or muskegs. Higher elevations of the Rocky Mountains have spruce, fir, and pine, while the Cascade Range and Sierra Nevada have mountain hemlocks, larch, pine, and red fir. White fir, ponderosa pine, and Douglas fir, are found at lower elevations in the Rocky Mountains. Humid areas of the Pacific slope are characterized by hemlock, Douglas fir, Sitka spruce, and redwood. Eurasian coniferous plants are of the same genera as those of North America, but usually of different species. Most trees are evergreen and carry on photosynthesis even at reduced temperatures.

Temperate Deciduous Forests.—These forests have broad-leaved trees that are leafless during the winter and are similar in appearance in North America, western Europe, eastern China, and Japan. Usually they are dense, but where they merge with prairies, savannas with scattered trees or groves are found. Northern areas of the United States have beech, maple, and basswood as the common trees. To the west and south, hickories and oaks predominate. There is a mixed vegetation of basswood, buckeye, and other trees in the Appalachian Plateau. The deciduous forests of Eurasia have different species of the same genera of plants that occur in North America.

Chaparral.—Open stands of trees with a growth of grasses or shrubs between are characteristic of this vegetation type. Usually the trees are evergreen and tolerate low moisture. In North America, chaparral extends from California and Arizona southward into Mexico. These areas usually contain many different species of oaks, some of which grow to an enormous size. During the winter, rains are frequent, and the countryside appears quite green. In summer, however, there is little rain, the grasses becoming dry, and fires are a hazard. A similar chaparral formation occurs around the Mediterranean Sea.

Grassland.—In all continents where precipitation is low and evaporation high, grassland

occurs. Most grasses are perennial, with leaves originating at the base. Most tolerate grazing well. Important genera of New World grasses include *Andropogon*, the blue stem; *Agropyron*, the wheat grass; *Festuca*, the fescues; and *Buchloë*, buffalo grass. Taller grasses are found where rainfall is greater; short and bunch grasses, in arid areas. Many other herbaceous plants are also found in grassland. In the spring, the prairies are often very colorful because of the many blossoming plants.

Desert.—These areas of very low annual precipitation characteristically have widely spaced shrubs, bushes, or cacti, which are often covered with thorns or prickles. The ground between is usually a pavement of soil, gravel, or rock. Desert plants are able to survive long dry periods and to resist desiccation. See also **DESERT**.

Tropical Areas.—The tropics are characterized by a uniform temperature and uniform daylight length throughout the year. Rainfall varies in distribution but is often abundant. The vegetation is a continuum from desert through savanna to tropical deciduous forest and finally to the broad-leaved evergreen or rain forest. The savanna is extensive and has a stratum of herbaceous plants, such as grasses and sedges, with scattered shrubs, trees, or palms. The tropical deciduous forest is leafless during the dry season and has a high, nearly continuous canopy during rainy periods. The broad-leaved evergreen forest is almost completely evergreen and is rich in woody lianas and epiphytes. Seasonal changes are minimal, and at least three strata of trees occur, as well as one of shrubs and giant herbs, and one of low herbs and undershrubs. Tree bases may have buttresses or stilts, and palms and tree ferns are usually found. The variety of species is enormous.

See also **ADAPTATION; PLANTS AND PLANT SCIENCE; TREES; TROPICS**.

Fauna.—The distribution of animals, like that of plants, is dependent upon both climatic and historical factors. Climatic influences include the availability of water, temperature ranges and fluctuations, wind, and relative humidity. Historically, distribution has been influenced by climatic changes, glaciation, geographical changes (mountain formation, or the appearance of land bridges or barriers), and evolutionary changes within the animals themselves.

Forest Animals.—Forests offer many habitats to animals. The floor usually has leaf litter, low-growing herbs, and rotting logs, all of which offer niches to small vertebrates and invertebrates. Burrowing forms utilize the soil itself. Above the forest floor is the herb layer, and then the low shrubs. Depending upon the type of forest, there may be one or more layers of trees, at times topped by a canopy of taller trees. The tree covering assures a high moisture content at the floor level and permits the development of a rich fauna of snails, millipedes, centipedes, land isopods, amphipods, arachnids, and amphibians. Tropical areas also have land planarians, crabs, and leeches. Forest reptiles are less effectively adapted to evaporation than are desert reptiles. In North America, mammals of the forest floor include the shrews *Sorex* and *Blarina*, and many rodents, especially of the genus *Peromyscus*. In the tropics of Africa and the Orient, shrews of the genus *Crocidura* are found.

Air currents are mild in forests, and many insects, especially the butterflies, have weak powers

of flight. The mammals utilize their sense of smell less than those of open country, but tend to be noisier, for the sense of hearing is important in maintaining flocks. Sight is not well developed; the forest interferes with vision. Tree growth also impedes rapid locomotion, and forest mammals often have short limbs and wedge-shaped heads. The ungulates have less development of horns and antlers.

The arboreal habit of forest animals is well developed, particularly in the tropics, where climbing animals have powerful claws and often have opposable digits. The hands of monkeys are modified for grasping, and tree-climbing marsupials have the hind feet similarly modified. Frogs and toads have sucking disks, and lizards may have adhesive organs on their feet. Arboreal vipers, some pit vipers, an arboreal mouse of New Guinea, and some kinkajous, tree porcupines, and New World monkeys possess prehensile tails. Many forms have evolved rigid supporting membranes which permit gliding flight. These include lizards (*Draco*), the flying lemur of the Malay region, flying squirrels of North America, and some Australian marsupials.

The forests have an abundance of animals, though they may be difficult to see. The forest margin actually has the greatest number of animals, for the forest serves as a hiding place, and the grasslands supply food.

Grassland and Desert Animals.—In these areas, the wind blows strongly, temperature and humidity fluctuations are great, the danger of desiccation is high, and there are few hiding places. Animals of these areas are fitted by both habit and structure to withstand the extremes of the environment. Many forms, including some tortoises, monitor lizards of the genus *Varanus*, some snakes, and many rodents, all form burrows. The burrowing prairie dog (*Cynomys*) of the western United States, members of the genus *Ctenomys* in Patagonia, the piping hares (*Ochotona*) of the Mongolian steppes, and the jumping hares (*Pedetes*) of the South African steppes are all common prairie rodents. Birds tend to nest on the ground; a few, such as the burrowing owl of Uruguay and Guiana, prepare a nesting hole in the ground. The burrowing owl of North American plains inhabits abandoned prairie dog holes.

Both mammals and birds have keen eyesight in open country and rely less on hearing than do their counterparts in forests. Groups rely on sight for keeping together and are less noisy than forest animals. Many desert and grassland animals congregate in groups or herds; the ungulates and ostriches of Africa, the kangaroos of Australia, and the bison of the United States and Canada have this habit. Open-country animals are adapted to running. Some outstanding runners are the zebras, cheetahs, antelopes, and ostriches of Africa and the rheas of South America. Predatory forms, such as the wolves, lions, and cheetahs, are long limbed and capable of sustained running. In Australia, the characteristic grass eaters are the kangaroos, jumping forms with enormously developed hind limbs and tails. Other jumping forms include the African jumping hare and the kangaroo rat of the North American deserts.

Large numbers of grasshopperlike forms are found in grassland. The migratory locusts, which often develop large swarms, occur on all continents. Termites and ants also abound and may form spectacular nests. There are large numbers of reptiles, including snakes, lizards, and turtles;

many feed on insects. The large number of insects and seeds also favors ground feeding by birds. Many birds are adapted to running, and their young are quite mature when hatched. Among mammals, herbivores predominate, and rodents occur in large numbers.

In colder arid regions, snails, insects, spiders, the few reptiles present, and the small mammals become dormant during the cold months. Birds usually migrate southward.

In deserts, animals tend to be pale in color, and they have structural adaptations or habits that help conserve water. They often form burrows, which aid in escaping desiccation. Reptiles are particularly abundant, and running, jumping, and burrowing vertebrates are important in the fauna.

Northern and Alpine Animals.—The area above the timberline in mountains is a special environment with difficult terrain, isolation, and storms. A few true alpine forms are the marmot and pika of the Rocky Mountains, the European redstart, and the snowfinch of the Alps. Animals of the polar regions likewise have a difficult climate, with long winters, short summers, and low temperatures. In the north, the springtails are abundant insects on the ice; reptiles and amphibians are few. The warm-blooded animals of polar regions have special heat conservation structures, such as thick layers of fat and heavy coverings of hair or feathers. The polar bear, lemming, hare, musk ox, reindeer, ermine, wolf, and fox are found in Greenland, an Arctic area with a large number of land mammals. Land birds are few, though there often are many marine forms. Smaller birds, geese, and swans are migratory.

Aquatic Animals.—Ocean fauna is adapted to life under the varied conditions of different regions. Depending upon the substratum, the intertidal zone provides a habitat for many invertebrates, including some worms, mollusks, sea anemones, starfish, and corals. Below this zone, the shallow parts of the ocean have many varied invertebrates as well as fish. In the great depths, where pressure is high, many bizarre animals dwell, including long, slender fish with gaping jaws, and bottom-dwelling worms, starfish, mollusks, crustaceans, and other invertebrates. Some of these animals produce light by bioluminescence.

Penguins have evolved as a highly specialized life form in order to cope with a generally harsh environment.

U.S. Coast Guard

Inland waters (streams, lakes, ponds, swamps) have many animals. The bottom mud is a home for worms, mollusks, insect larvae, and other small forms. Above the bottom are the microcrustaceans, protozoans, and aquatic insects. Many species of fish also inhabit these waters.

See also ECOLOGY; OCEANOGRAPHY—*Biology of the Ocean*; ZOOGRAPHY.

Peoples and Their Distribution.—Like all organisms, man is subject to the many factors of his physical environment, but because of his cultural development, he tends to react on the environment more strongly than does any other organism. He is structurally, physiologically, and psychologically a highly adaptable form; and even before the establishment of complex types of culture, man had spread into nearly all land communities. The movement into the Americas was slower than that into other areas, but it occurred thousands of years ago.

Distribution by Race.—Living men constitute a single species, *Homo sapiens*; thus all human beings possess a similar genetic heritage. Within this single species, there is great biological and cultural diversity. The variation within the species is biologically favorable, for it extends the range of adaptation and is material for progressive changes. Evidence is lacking to prove that any one race or group is inherently or biologically better than any other. It is possible that racial differences originally suited each race better to the area in which it lived, but cultural changes have tended to eliminate this very local superiority.

Groups of human beings are differentiated from one another by hair form, skin color, shape of head, facial features, and stature. They are divided into three main races—Negroids, Mongoloids, and Caucasoids—each of which is considered to have a common ancestry and similar physical characteristics. At present, individuals of these races are found on all continents, but their distribution before 1492 was more restricted. The races have been blended by intermarriage, so that they are not always distinct. Their exact number of subdivisions is uncertain, and classification is difficult.

The Negroids are characterized by their woolly hair and a skin color that varies from yellow through dark brown to black. Most dwelt originally in Africa, but the Negritos of the Philippines, the Malay Peninsula, and Western New Guinea, and the Melanesians found from New Guinea to Fiji and in Micronesia are also members of this race. The Mongoloids usually have straight black hair, little or no facial hair, and a skin color that varies from yellow-white to brown. They probably had their origin in Asia, but migrations that occurred thousands of years ago resulted in the establishment of the populations known as the Indians of North and South America, the Eskimos of North America and northeastern Asia, the Patagonians of southern South America, and the Polynesians found from Hawaii to New Zealand and from Samoa to Easter Island. The Caucasoids tend to have hair that is smooth to wavy and a skin color varying from pinkish-white to brown-black. Originally they were found in Australia, northeastern Asia, India, northeastern Africa, Arabia, Europe, and parts of Russia.

Distribution by Population.—The exact site of man's origin is unknown, but fossil evidence indicates that it occurred in the Old World. From his earliest origins, man must have wandered constantly in search of food and shelter or in response

to seasonal and climatic changes. Later, curiosity or a desire for trade may have provided additional motivation. During these many wanderings or even migrations, groups met, intermarried, and drifted gradually into all habitable areas of the earth. Populations that became isolated gradually developed racial and cultural characteristics of their own. The rate of cultural development varied widely in different groups.

The peoples occupying such forbidding areas as portions of the Arctic, the extreme southern regions, and the tundra have a relatively low cultural level. While man is highly adaptable, the stresses of these environments are such that the inhabitants spend all their energies simply to keep alive. Even the coniferous forest formation, with its severe winters, is heavily populated only in its southernmost reaches.

Man has reached his highest development and greatest population density within the deciduous forest zone. Though the climate of the area originally occupied by these forests often has extremes of temperature, they tend to be less severe than those of more northern areas and of the grasslands. The seasonal changes and variable climatic conditions appear to be most favorable for the greatest efficiency of man's activities and his best health and energy.

The grasslands of the world are still, in many areas, occupied by scattered groups, some of which are seminomadic. In the United States, many large cities and the most productive food-growing areas are found in this formation, but this development has been made possible only by modern technology. Formerly, the grasslands offered nearly insurmountable problems for habitation. Swarms of biting insects attacked people, there was not always sufficient water, and building materials were lacking.

In general, the tropics are only sparsely settled, by peoples who often have a low level of culture. Malaria, hookworm, and skin parasites still present great health problems, and large populations are found in the tropics only in those areas where the many diseases have been somewhat controlled. At the time of the arrival of white men in Central and South America, two native cultures were flourishing: the Incan, chiefly in the invigorating climate of the Andean Highlands; and the Mayan, which had its origin in the rain forests of Central America. Remarkable cultures also flourished in the tropics of southeast Asia. These civilizations, however, were exceptions to the general picture of only scattered populations in the equatorial belt.

The arid regions of the world likewise have been relatively unpopulated until the development of modern technology. Even now, except where irrigation makes agriculture possible, the arid regions are occupied only by nomadic peoples who often are of a low cultural level.

WORLD BANK. See under INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT. See also BANKS AND BANKING—*World Bank*.

WORLD COUNCIL OF CHURCHES, an international association of over 250 major churches, Protestant, Anglican, and Eastern Orthodox, in all the continents. Its purpose is to foster co-operation and greater unity among all churches of the world. Its activities embrace major common concerns, including worship, evangelism, education, social and interracial justice, and international understanding and peace. An important function is mutual aid on a worldwide scale. Its work is administered in three divisions: Faith and Witness, Justice and Service, Education and Communication.

Officially inaugurated at an assembly in Amsterdam, Aug. 22 to Sept. 4, 1948, it was the outgrowth of several earlier international gatherings in the interest of cooperation and unity among the churches, especially the Oxford Conference on Christian Life and Work and the Edinburgh Conference on Faith and Order, both in 1937. In the next decade a "Provisional Committee for the World Council of Churches" laid the groundwork.

For several years the European and North American members exercised a dominant influence, but after the third assembly, held in New Delhi in 1961, the participation of the Asian, African, and Latin American churches became greater, and churches in the Soviet orbit joined. Although the Roman Catholic Church is not a member of the council, its relations with the World Council have been increasingly cooperative, especially since the Second Vatican Council in 1962–1965, and a "joint working group" meets regularly. Member denominations send delegates to a plenary assembly about every five years. A central committee of about 100 meets annually. A small executive committee oversees day-to-day operations of the permanent secretariat in Geneva.

SAMUEL MCCREA CAVERT

WORLD COURT. See INTERNATIONAL COURT OF JUSTICE.

WORLD GOVERNMENT. Strictly speaking, the concept of a world government could not arise until some two centuries after the great discoveries of the 15th century and the spread of trade and settlement had produced the world we know today. But since the problem of world government is essentially that of bringing together in one state a number of independent or "sovereign" states, that is, the process of political integration, the known past of this process is helpful in the understanding of the contemporary problem of political integration of the whole world. In the historic past the process has often resulted in the formation of larger political units from numerous smaller ones; the great seal of the United States sums it up neatly: *e pluribus unum*, from many one. Purely for purposes of analysis, one may distinguish one extreme of integration by force or conquest, and another of integration by consent, the first known briefly as imperialism, the second as federalism. The historical record from the beginnings of civilization in the Middle East, India, and China 4,000 to 5,000 years ago rarely shows integration by either imperialism or federalism in their pure logical extremes. Successful empires in part initiated by conquest, like the greatest and most successful in our Western civilization, the Roman Empire, have been held together by at least the tacit consent of conquered peoples. Such spectacular conquests as those of the Huns and Mongols are, in terms of true integration, superficial and ephemeral. Permanent rule based on conquest alone is hardly to be achieved save by the annihilation of the conquered and usually very primitive population, as in Australia and in the United States east of the Mississippi. On the other hand, union by consent alone is also rare; federalism in pure form has triumphed most notably in such countries as the United States and Switzerland, and in a sense in the association of the (British) Commonwealth of Nations.

Modern Theory and Practice. In modern times, planning for wider union of independent states by some form of consent goes back to such vague plans for some alternative to warfare as the "Great Design" of Henry IV of France (r. 1589-1610) and his minister, the duc de Sully, and continues, through the writings of the Abbé de St. Pierre and others in the 18th century on down to such contemporary American planners of world government as Grenville Clark, or of Atlantic Union, such as Clarence K. Streit. This body of writings forms a by-no-means unimportant part of the history of political theory and, like all such theory, has some effect on the course of events. World government, if it does come, will owe much to this long line of theorists.

In practice, over the last four centuries, two sorts of efforts at more extensive political integration, corresponding to the previous analysis, may be distinguished: those aiming at conquest and those aiming at voluntary union. Within an increasingly wide-flung network of states having organized international relations—now literally covering the whole world—certain preponderant states have at various times attempted what in rhetoric was often called "world conquest." The Habsburgs under Charles V and Spain under Philip II in the 16th century; France under Louis XIV in the 17th and early 18th centuries, and under Napoleon in the late 18th and early 19th centuries; Germany under William II and Adolf Hitler in the 20th century—all made more or less definite attempts to break down the European

and world system of "sovereign" states in balance of power. None of them succeeded; nor was the less aggressive (at least as far as Europe was concerned) preponderance of Victorian Britain anything like world government. Napoleon and Hitler came closest to building a new order by conquest, but neither built permanently. Nonetheless, it is likely that the future historian will record that even these fugitive experiences with wider governing units, including "spheres of influence" and "satellites," have played a part in preparing mankind for political integration on a world-wide basis.

Specific attempts at wider peaceful cooperation by consent among states have come, not without the influence of war-weary public opinion, at the end of each one of the half dozen or so world wars of modern times. The series shows an unmistakable progress toward more extensive and more effective voluntary union. After the Treaty of Utrecht in 1713 the great powers, having defeated Louis XIV of France, set up an alliance system specifically aimed at preserving the peace and held two congresses which at least helped delay outbreak of war. After the Congress of Vienna in 1815, the powers victorious over Napoleon, with France included, set up a similar alliance and congress system, backed up by the idealistic document called the Holy Alliance—a system which again helped to prevent a general war until 1914. In 1919 the Treaty of Versailles set up a League of Nations with headquarters at Geneva, Switzerland, with a formal charter, its own civil servants, and various functional organs. The League failed to keep the peace challenged by the Axis powers 20 years later, but even before the final defeat of those powers in World War II, a new and stronger league was set up at San Francisco in 1945. This United Nations (UN) organization, with headquarters in New York City and functional branches in Geneva and Paris, had 111 members in June 1963, including both the rival superpowers, the United States and the USSR. Of regional unions, the European Economic Community is a real union in the sense that it limits the sovereignty of its members on specific matters. Even the Organization of American States, though it does not directly limit the sovereignty of its members, is a much tighter group than the old-fashioned classic alliance. The same is no doubt also true of the Soviet satellite system in Europe.

United Nations. The UN is not a true government in the sense of possessing sovereignty over the individual citizens of its member states. Nor can it levy taxes and raise armed forces from an unwilling government of a member state. It has, however, its own armed forces and its own income raised voluntarily from its members. The Charter provides (Article 19) that a member-state not paying its regular assessments may lose its vote in the General Assembly. Certain member-states have refused to pay special assessments levied for purposes they disapproved—for example, the sending of a United Nations army to Katanga in the Congo in 1961—but the Charter contains no provision for penalties in such cases.

Attempts at some kind of ordered international politics that will keep the peace, in a way that the classic alliances and balance of power system did not, have been progressively more and more deliberate, sweeping, and in a sense successful. It would be rash to prophesy an effective world government in the near future, but it would

equally be shortsighted to maintain that no such government is possible. On the contrary, the precedents point clearly, assuming no catastrophic destruction of civilization, to the establishment of some form of organized world government possessing the necessary police and financial powers, and it is not inconceivable that the United Nations will develop into such a government.

WORLD HEALTH ORGANIZATION (WHO), a specialized agency of the United Nations, with headquarters at Geneva, Switzerland. It came into official existence on April 7, 1948, when its constitution had been ratified by 26 member states of the United Nations. It acts as the directing and coordinating authority on international health work; its aim is the attainment by all peoples of the highest possible level of health.

Work of the Organization. WHO provides to national governments, on request, advice and practical assistance in strengthening national health services; training doctors and health workers; controlling or eradicating such major diseases as malaria, yaws, tuberculosis, and leprosy; protecting the health of mothers and children; improving sanitation and water supply; and promoting mental health. As of 1962, 143 countries and territories were receiving direct help from WHO. Permanent services to all member states include a daily epidemic information broadcast; the establishment of international quarantine regulations; setting international standards for drugs, vaccines, and other biological substances; the promotion of medical research in certain fields; and the exchange of information through seminars, publications, and other media.

Organs and Staff. The governing body is the World Health Assembly, composed of delegations from all member states. It meets once a year, usually at Geneva, but occasionally elsewhere if invited by a member government. It alone decides the policies, program, and budget of the organization. The assembly chooses the countries entitled to designate one member each on the 24-man Executive Board, which meets twice a year, scrutinizes the program and budget proposed by the director general for the succeeding year, carries out investigations and surveys requested by the assembly, and reports to that body. The director general is responsible for the day-to-day

work of the organization. He appoints the staff of about 2,000 working at the Geneva headquarters, in the regional offices, and in the field projects. Six regional organizations—each composed of a regional committee, on which all governments in the region are represented, and of a regional office—are responsible for the conduct of the organization's work in Europe, the Americas, Africa, the eastern Mediterranean, Southeast Asia, and the western Pacific. The regional offices are situated in Copenhagen, Washington, Brazzaville, Alexandria, New Delhi, and Manila, respectively, for the areas indicated.

Membership and Resources. Membership in the organization is open to all states. It increased from 56 member states in 1948 to 151 in 1980, plus two associate members (countries not responsible for the conduct of their own international relations). The regular budget is contributed directly to WHO by its member states. Other financial resources include two funds consisting of voluntary contributions, one for malaria eradication and the other for health promotion; and the United Nations Fund for Technical Assistance to Underdeveloped Countries, of which a substantial part is employed for health work. In addition, the United Nations Children's Fund (UNICEF) assists numerous international health projects by contributing supplies and materials.

WORLD SERIES, in major league baseball, a championship tournament played by the pennant winners of the National League and the American League. Seven games are scheduled, and the team that wins four games is the champion. First played in 1903, the series has been an annual event since 1905. Beginning in 1969, when each league was expanded into East and West divisions, a League Championship Series has been held between the winners of each division to decide the contenders in the World Series.

Medical specialists from many nations have volunteered to work for the World Health Organization.

WORLD WAR I

WORLD WAR I, the name commonly given to the war of 1914-1918, which began in Europe and was fought principally on that continent but eventually involved all the continents of the world. While the wars between Great Britain and France from 1689 to 1815 had been extended to North America, Africa, and Asia, they remained wars between European governments. The term "world war" is properly applied to the conflict of 1914-1918 because the various parts of the British Empire in all continents as well as many countries in Asia and North and South America participated in it. For the first time, all the great powers of the world were engaged: Austria-Hungary, France, Germany, Great Britain, Italy, and Russia in Europe; Japan in Asia; and the United States in North America. It is estimated that by the end of the war about 93 percent of the population of the world was in greater or less degree involved.

The causes of World War I, its military operations, diplomacy, costs, and aftermath are discussed under the following headings:

1. General Survey

At the time World War I broke out, no general war had been fought in Europe since 1815.

EUROPE IN 1923

There had been many revolts as well as a number of short wars, the latter being fought mostly with small professional armies, which did not seriously affect the life of the countries involved; the casualties were not excessive. Among these were the three wars that occurred between Russia and Turkey (1828-1829; 1853-1856—the Crimean War; 1877-1878); and three wars among the Balkan states (Serbia and Bulgaria, 1885-1886; Greece and Turkey, 1897; Balkan states and Turkey, 1912-1913). Three wars with Austria were required for the unification of Italy (1848-1849; 1859; 1866); and three wars were also needed for the unification of Germany (1864; 1866; 1870-1871). The Russo-Japanese War lasted somewhat longer than most of these conflicts, from February 1904 to September 1905; it came to an end because Japan had run out of money, and Russia was faced with revolution. There had also been such international conflicts as the Spanish-American War of 1898 and the South African (Boer) War of 1899-1902.

The most destructive war of the 19th century was the American Civil War of 1861-1865, which cost the lives of considerably more than half a million soldiers (out of a population of less than 32 million) and stopped only when the South was completely exhausted. From a military point of view, it was the first modern war. Railways were used extensively for the transport of troops and supplies, and communications were maintained by military telegraphs. Rifled cannon replaced the conventional smoothbore guns; breech-loading repeating rifles firing metallic cartridges took the place of muzzle-loading muskets. Machine guns, wire entanglements, hand grenades, land mines, and trenches proved themselves formidable in defense, as was shown by the Confederate Army in front of Richmond. Observation of the battlefield was undertaken by balloons, and signaling by flags and lamps was

highly developed. At sea the first duels were fought between ironclads. But European observers were not impressed by the volunteer, essentially civilian armies which fought the war; the chief of the Prussian General Staff, Field Marshal Count Helmuth von Moltke, referred to them as "armed mobs chasing each other around the country, from whom nothing could be learned." As Lynn Montross points out in *War Through the Ages* (3d ed., pp. 590-592, New York 1960), while the generalship of Thomas J. (Stonewall) Jackson may have been much admired, European students of war did not deduce from the American experience that modern weapons gave the defensive a strong advantage over the offensive, and that a war fought with all the resources of modern industry would be a long-drawn-out affair.

In the century after Waterloo, Europe had been transformed politically by the universal adoption of constitutional governments (even Russia and Turkey had parliaments) and by the widespread, though not universal, provision for manhood suffrage. In greater or less degree all governments were responsive to public opinion, and they could hope to wage war successfully only if they enjoyed popular support.

During this same period the economy of Europe was transformed even more by the Industrial Revolution—that is, by the use of iron and steel in the manufacture of machines and the use of the steam engine (and later electricity) to provide power for operating the machines. By 1914 the machine age had spread to Russia, though not on so extensive a scale as in western Europe. An important accompaniment of this economic revolution was the enormous increase in population: that of the British Isles, for example, rose from 15 million in 1815 to 45 million in 1914; that of Germany, from 25 million to 65 million; and that of Russia (including Russian Poland and Finland), from 45

million to 178 million. These millions could be fed only by vastly improving the methods of agriculture or by importing food. From the military point of view, much larger armies could be raised than in previous ages and, after the Franco-Prussian War of 1870-1871, which seemed to demonstrate the superiority of the German armies raised by conscription, the principle of universal military service was adopted by all the Continental great powers. Every able-bodied man was required to serve a period of years with the colors; after this active service he passed into the reserves, but he could be recalled to arms in the event of war. In 1914 the standing armies of France and Germany totaled about 800,000 men each. Including trained reserves, France had 4,017,000 men and was able during the war to mobilize another 4,393,000; the corresponding figures for Germany were 4,500,000 and 6,500,000, respectively. The numbers in proportion to total population were lower in Italy, Austria-Hungary, and Russia, while Great Britain, which had not yet adopted conscription, maintained a small volunteer army and had no system of reserves except for retired soldiers.

When war came in 1914, mobilization was ordered instantly. The war was fought by the entire manhood of the belligerent countries. Although the levy en masse had been employed to a considerable extent during the wars of the French Revolution and the Napoleonic period, the effect on national life was nothing like what took place from 1914 to 1918. In the earlier conflicts industry in the modern sense hardly existed, and the peasants were able to supply enough food for both armies and civil populations. In World War I the withdrawal of millions of men from agriculture and industry greatly reduced production. At all costs the soldiers had to be fed, clothed, and armed. As the war progressed, the state was forced increasingly to take over the management of the national economy. After the armies had been supplied with what they needed, what was left of both food and manufactured goods was rationed to the civilian population, which, as time went on, suffered privations of all kinds. The war, in short, became an all-out effort not only on the part of the military forces, but on that of the civilian front as well.

From a technical point of view, World War I was the war of the internal combustion engine, which was used in the trucks that conveyed troops and supplies from railheads to the front; and in airplanes, tanks, and submarines, all of which were employed on a practical basis for the first time. Another technical innovation was wireless telegraphy, which was used at sea to communicate with ships and on land to transmit orders.

In Russia morale collapsed in 1917, and revolution resulted. In Germany and Austria-Hungary morale did not break until the armies were defeated in the field, but the fighting qualities of the armies deteriorated in 1918, as supplies at the front ran short and the soldiers learned of the ever-growing distress at home. If Britain, France, and Italy were able to hold out until victory had been won, it was because they received help on an enormous scale from the United States for both military and civilian needs. (This help was made possible through the defeat of the German submarine campaign by the adoption of the convoy system.) Thus the war was not a mere contest of governments,

but a struggle of peoples.

Each people entered the conflict with a deep conviction that it had been attacked by its enemies, and this conviction helped to keep up the courage necessary to see the war through. Not only must the enemy be thoroughly beaten, but guarantees must be obtained that he could never repeat his aggression. Furthermore, instead of the short war that was generally expected, the struggle lengthened into years and the casualties became almost unbearable, so that both governments and peoples came to feel that the terms of peace to be imposed on the defeated enemy must be extremely harsh. In December 1916, during a lull in military operations, Germany and its allies proposed peace discussions; Britain, France, and their allies not only refused any discussion, but in January 1917 announced terms of peace that could be realized only if the other side were completely defeated. Germany's terms, which were not made public but were communicated to the president of the United States, were equally severe. The few voices that were raised then and later in favor of a compromise peace got no hearing. The war had to continue until victory was won. Early in 1917 the fabric of European society had not been severely shaken; the emperors of Germany, Austria-Hungary, and Russia and the sultan of Turkey still sat on their thrones. The world would probably have been spared much agony if peace could have been made at that time, but psychologically this was impossible.

So the war continued until the end of 1918, bringing in its train the Communist revolution in Russia and the overthrow of monarchy in Austria-Hungary and Germany. Not only did the house of Habsburg lose its throne, but the territory of Austria-Hungary was divided among six states consisting of the principal peoples that had been held together in the monarchy for several centuries: German, Magyar, Polish, Czechoslovak, Yugoslav, and Rumanian. When peace was made after the war, the new states were recognized by the victorious Allies. This doctrine of self-determination was also applied in the areas in western Russia that split off after the Communist revolution. The most important single consequence of the war was probably the recognition of the principle of nationality on the broadest possible scale. For the first time in European history, almost every people in Europe was able to establish an independent government and a unified state. In most cases, it was not possible to draw frontiers without leaving minorities on the wrong side of the line, but the number of such minorities after the war was much smaller than it had been before 1914. The establishment of the succession states of Austria-Hungary has often been criticized on the ground that they replaced the much larger economic unit of the former state, but except in minor details the arrangements made in 1919 survived World War II and, historically speaking, appear to have justified themselves.

Since the democratic parties had won the war, the world had supposedly been "made safe for democracy," as President Woodrow Wilson put it, and after the war a democratic form of government was adopted in Germany and in most of the countries of central and eastern Europe. By the 1930's, however, this experiment had failed, and the new democracies, with the exception of Czechoslovakia, had gone over to

fascism, nazism, or some other form of autocracy or totalitarianism. This came about because Europe had never recovered from the terrible losses of the war. Before 1914 the European economy was based on the gold standard and on an almost complete freedom to export and import goods except as limited by tariffs. The war almost completely destroyed this system, which was replaced by managed currencies and by all kinds of governmental regulations. While a superficial recovery took place in the 1920's, it depended on American loans, by means of which such reparations as were paid were financed; when these loans dried up as a result of the great depression in the United States, European prosperity also collapsed.

Apart from the material destruction caused by the war in many parts of Europe, the human losses—at least 10 million men were killed or missing, and many millions more were wounded—could never be made good. Not since the Thirty Years' War in the 17th century had Europe passed through such suffering and horror as in the years 1914–1918. So it was hoped that World War I had taught mankind a lesson; those who suffered through it little dreamed that two decades later a second and even more terrible world war would take place.

BERNADOTTE E. SCHMITT,
Professor Emeritus of Modern History, University of Chicago.

2. Prelude to War

World War I began suddenly and unexpectedly in July 1914 as a result of the murder of Archduke Francis Ferdinand, heir to the throne of Austria-Hungary, which took place on June 28 at Sarajevo, Bosnia. Since no war involving all of the six great powers of Europe had occurred since 1815, the possibility of a general war had generally been discounted, at least by ordinary persons. Although in the winter of 1912–1913 the small Balkan states had staged a successful war against Turkey, almost expelling the latter from Europe, and then fought among themselves, the great powers had kept the peace. Questions concerning the new state of Albania and the islands of the Aegean Sea remained unsettled in the spring of 1914, but it was generally assumed that another Balkan crisis would result in another compromise. Statesmen in all countries were in the habit of proclaiming their devotion to peace, and perhaps believed their professions. Few persons in any country were psychologically prepared for the catastrophe of a general war, for while there had been many British, French, German, Italian, and Russian predictions of impending disaster, they had commanded little attention.

The reason for this indifference was the widespread belief, at least in the democratic countries of Europe, that modern governments were too enlightened to go to war. In 1910, Norman Angell, a Briton who, after some years in the United States, had spent most of his life on the Continent, published a book called *The Great Illusion*, which caused a sensation. Angell said bluntly that wars did not pay. Modern economic life, he argued, was a highly complicated affair and depended on mutual confidence between nations and on an elaborate system of international credit, both of which would be destroyed by war. If governments were so foolish as to go to war, they would lose much more than they

could gain, and the victors would be ruined as well as the vanquished. Angell's thesis was by no means universally accepted, particularly in Germany, but the opinion was often expressed that war was much too expensive for governments to contemplate, and that, if any government did so, it would be stopped by financial pressure. And it was a fact that in July 1914 the strongest opposition to war came from bankers in England and Germany.

In all European countries the Socialist parties, which were growing more powerful with each election, were in principle opposed to war, and they championed the idea that the workers should not respond to an order of mobilization. Moreover, there were many persons who hoped that somehow the influence of the Christian churches, especially that of the Roman Catholic Church, would be thrown into the scale against war.

Underlying Causes of the War.—When, on July 23, 1914, Austria-Hungary accused Serbia of responsibility for the murder of the archduke and made demands that seemed to foreshadow military action, the illusions of pacifism vanished overnight, and the citizens of all countries who before Sarajevo had had no thoughts of war accepted it as something unavoidable. Men then began to ask themselves how the war had come about, distinguishing between the immediate antecedents and the deeper roots. A popular explanation was that it had been caused by economic jealousies and rival imperialisms. Thus for 25 years Germany had been challenging the century-old commercial supremacy of Great Britain; Germany, it was argued, was pushing Britain to the wall, and Britain had gone to war to destroy German competition. Then there were the rivalries between Britain, France, Germany, and Russia in the Balkans, Africa, and Asia that more than once had brought them to the brink of war; and along with the activities of governments went the intrigues of high finance in all parts of the world to obtain concessions for railways, canals, oil wells, and other profitable enterprises. This explanation of the "international anarchy" was championed by socialists, who derived their ideas from Karl Marx, but it was not exclusive with them; on the very eve of the war in 1914, Henry Noel Brailsford, an English radical, published a book entitled *The War of Steel and Gold* that said much the same thing.

Undoubtedly economic interests and rivalries played a considerable part in creating international tensions in the 43 years between the Treaty of Frankfurt, which closed the Franco-Prussian War, and the outbreak of World War I. The dispute between Austria-Hungary and Serbia, which set off the explosion, was greatly envenomed when Austria sought to control Serbia by harsh commercial treaties and by the imposition of severe sanitary legislation against the importation of Serbian livestock (the so-called Pig War, which began in 1905). A long tariff war (1888–1898) embittered the relations between France and Italy. In colonial matters there were such sharp conflicts as those between Britain and Russia in Persia (Iran), between France and Italy in Tunisia, between Germany and France in Morocco, between Britain and France in Egypt, and between Britain and Germany in Africa. More than once war seemed imminent. Likewise the project of building a

railway from Constantinople (Istanbul) to Baghdad and the Persian Gulf, the Baghdad Railway (q.v.), which was the most famous undertaking of financial imperialism, involved Britain, Germany, France, and Russia in years of bitter wrangling. In consequence of these rivalries for colonies and the competition for concessions, all the governments built up their navies, which seemed necessary for the protection and expansion of their interests overseas. The naval rivalry between Germany and Britain became the most important single factor in their antagonism.

Yet economic interests, in the usual meaning of that phrase, had little to do with the outbreak of war in 1914. The trade rivalry between Britain and Germany, which had been so much advertised 10 years before, was easing off because the two countries were increasingly developing their markets in different parts of the world—Britain within its own empire, and Germany on the continent of Europe. In the spring of 1914 the various powers interested in the Baghdad Railway arrived at a compromise which seemed to ensure the completion of the line, and at the same time they divided the Ottoman Empire in Asia into spheres of economic influence for the laudable purpose of avoiding war over the Turkish succession.

On the colonial side the great powers were able to partition Africa without recourse to war. The British fought the Afrikaners (Boers) in South Africa, and British, French, Germans, and Italians fought native peoples throughout the continent, but the Europeans did not fight one another. In the spring of 1914, Britain and Germany were ready to sign an agreement concerning the ultimate disposition of the Portuguese colonies in Africa. Instead of going to war over Persia, Britain and Russia had divided it into zones of economic exploitation. To be sure, Japan and Russia had fought a serious war over Korea and Manchuria, but it may be said that by 1914 the economic rivalries and colonial disputes that loomed so large in the first decade of the 20th century had greatly diminished, and they played no part in the negotiations which immediately preceded the war.

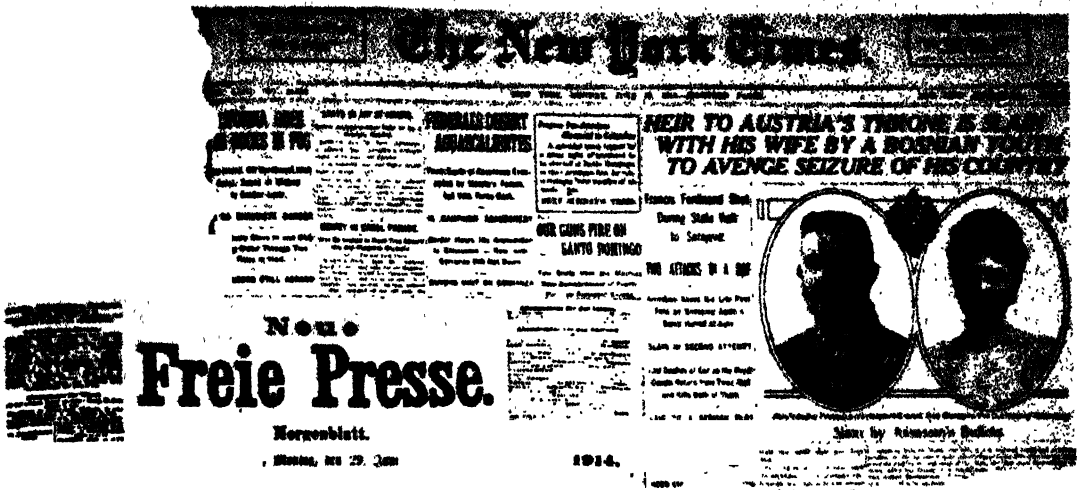

But if strictly economic questions were of small importance in bringing on the war, that could not be said of problems of strategy and military power and national prestige because of the German enigma. Germany was the most restless nation in Europe. Its population, industry, and foreign trade were growing more rapidly than those of any other European country, and it had become the second industrial and commercial nation of Europe, with every prospect of becoming the leader and thereby upsetting the balance of power. The Germans did not, however, feel sure of their future. As they looked around them, they observed that Britain had secured control, in one form or another, of the most desirable parts of Africa, held large possessions in Asia, and ruled the ocean lanes from innumerable islands in the seven seas which provided naval bases and coaling stations. In comparison, the German colonies in Africa and Asia and the German islands in the Pacific were pitifully inadequate. They were not generally suitable for white colonization, the small German population consisting of officials, soldiers, and traders; their trade with the mother country was infinitesimal; and they were a financial

burden to the home government. Even the early colonial nations that were no longer major powers—Spain, Portugal, and the Netherlands—were better off than Germany. The prevailing view was that colonial possessions were necessary for an industrial nation in order to supply the raw materials needed in industry, to furnish markets for manufactured goods and opportunities for the investment of capital, to provide outlets for emigration, and to offer careers for ambitious persons. Germany, not having rich, productive, and populous colonies, felt discriminated against, even though it could and did buy and sell freely throughout the world.

So, in the last decade of the 19th century, there arose in Germany a tremendous agitation and a loud cry for "a place in the sun"; along with this, the charge was frequently made that out of jealousy and hatred Germany's rivals, principally Britain and France, were standing in the way of the nation's acquiring its just due. The achievements of Germany in industrial progress, social legislation, and municipal administration were so universally admired by foreign visitors and observers that the Germans came to believe that they were a superior people, and they proclaimed this belief in innumerable books, pamphlets, and speeches. While other nations have always held high opinions of themselves, they have never carried self-adulation to the pitch reached in Germany before 1914.

The Alldeutscher Verband (Pan-German League; see PAN-GERMANISM), a small but noisy and influential association of prominent persons, proclaimed that it was necessary to complete the unification of the Germanic peoples of Europe, millions of whom did not live within the empire established in 1871, and writings of all kinds set forth in detail what was wanted elsewhere in the world. Since these programs were to be realized at the expense of other nations, it was often stated that Germany would use force if necessary to achieve its ends. A vast literature in praise of war as a necessity for Germany and as a purifying experience came into existence, and the German Army became the most venerated institution in the country. Emperor William II helped by his flamboyant speeches to create the impression that Germany was bent on war and would stop at nothing. Foreign visitors were uniformly impressed and alarmed by German militarism, which before 1914 was regarded outside of Germany with something like the horror felt in the 1950's and 1960's toward communism outside the Soviet world.

The German government never associated itself with the demands of the agitation for colonial expansion, but it resorted to methods of diplomacy which gave great offense. It utilized the South African (Boer) War of 1899–1902 to force concessions from Britain in Samoa; it seized the opportunity offered by the Russo-Japanese War of 1904–1905 to secure from Russia a commercial treaty that was unduly favorable to Germany; and when Russia, the ally of France, was defeated in the Far East, Germany forced France to get rid of its foreign minister and to change its policy with respect to Morocco. The British, Russian, and French governments regarded the German actions as blackmail and became increasingly suspicious of the ultimate aims of German policy. Inevitably they drew together in a diplomatic combination which

came to be known as the Triple Entente (q.v.), and the Germans denounced this action as "encirclement."

In addition, in 1900 Germany embarked on the construction of a navy intended to be second only to that of Great Britain. This was a favorite project of William II, and he declined all suggestions from Britain for a limitation of naval armaments. The greater the German Fleet grew, the more dangerous it seemed to the British, who regarded their century-old naval supremacy as the foundation of their political independence and the condition of national existence. For military as well as for political reasons, therefore, Britain drew closer to France and Russia, and the closer these relations became the more Germany complained of encirclement. The problem presented by Germany to the other European powers must be kept in mind in considering what happened in July 1914.

Nevertheless, despite what has been said about German ambitions, the primary cause of World War I was the conflict between the political frontiers of the European nations and the distribution of the various peoples of Europe—the denial of what is commonly called the right of self-determination, although this term was not generally used before 1914. From the Rhine eastward the political frontiers of Europe, as fixed by the Congress of Vienna in 1815 or determined by the wars of the 19th century, cut across recognizable lines of nationality. In the west, Germany held Alsace-Lorraine (q.v.), taken from France in 1871 against the wishes of its people, who disliked German rule and wished to return to France; it is not too much to say that the blunder of Germany in annexing Alsace-Lorraine and the refusal of France to recognize its loss constituted the most important single factor in the history of Europe from 1871 to 1914. East of Germany lay Austria-Hungary, which contained 11 different ethnic groups, 9 of which were kept in greater or less subjection by a ruling clique of Germans and Magyars;

many of the Germans dreamed of union with the German Empire. In the Balkans ethnic and political boundaries, the latter determined by the Treaty of Berlin (1878) and the Treaty of Bucharest (1913), rarely coincided. The Russian Empire in 1914 possessed vast non-Russian territories, which were later represented by Finland, Estonia, Latvia, Lithuania, Poland, and the Rumanian province of Bessarabia. Poland was the most notorious case of the denial of self-determination, for it had been divided between Austria, Prussia, and Russia in the late 18th century and again in 1815. A minor case was presented by Schleswig-Holstein (q.v.), where a Danish minority lived under Prussian rule.

The Austro-Hungarian, German, and Russian

governments showed little skill in handling their minorities. Some groups were treated more harshly than others, but everywhere the minorities grew increasingly restless under political repression and economic oppression, and they demanded concessions. In Austria-Hungary some minorities were able to look across their frontiers to the free kinsmen who, they hoped, would one day free them from the antiquated rule under which they suffered. The Yugoslavs of both Austria and Hungary, refused concessions by their Habsburg rulers, looked for help to Serbia, which, under King Peter I Karageorgevich, was independent nation; and the Rumanians of southeastern Hungary, gazed

which had a Hohenzollern king. The Poles refused to give up hope of reunion, which, they were well aware, could come about only as the result of a war involving their three partitioners, and many Poles undoubtedly welcomed the coming of war in 1914.

This conflict between existing governments and their unhappy minorities was the factor primarily responsible for the catastrophe of 1914. Germany understood that the annexation of Alsace-Lorraine could be maintained only by the sword and armed accordingly; France was equally aware that the lost provinces could be regained only by the sword, and for years many Frenchmen dreamed of a war of revenge. This Franco-German irreconcilability poisoned the international atmosphere. The multinational Habsburg monarchy came to rely more and more on force and less and less on the loyalty of its peoples, which was slowly but surely seeping away. The partition of Poland was maintained only by the armies of the three partitioning powers; and the frontiers of the Balkan states depended exclusively on armed might.

The victories won by Prussia in its wars against Denmark, Austria, and France in 1864-1871 were generally attributed to the superiority of its conscript armies over the semiprofessional troops of the vanquished. It was not surprising, therefore, not only that the new German Empire continued to recruit its armies by universal military service, but also that the Continental neighbors of Germany adopted the same system. Only Great Britain retained the volunteer system for raising its relatively small army, which was designed to defend the British Empire and not to join in a Continental war. As population increased, so did the numerical strength of the European armies; in addition, every improvement in the weapons of war by one country was a challenge to all. From 1872, when France adopted the German system, until 1914, every government spent as much money on armaments as it could persuade its people to pay for in taxes or as the national economy could afford; the cost was easily borne by an increasingly prosperous Germany but was ruinous for Italy. This competition did not, however, produce any increased feeling of security. On the contrary, the proportionate strength of the various armies was not very different in 1914 from what it had been 40 years earlier; the feeling of insecurity was much greater, as may be seen in the war memoirs of Gen. Erich F. W. Ludendorff.

Disputed and unstable frontiers were not, of course, the only reason for great armies. European governments had always maintained armies, partly to keep order at home, partly as levers in

diplomatic bargaining, and sometimes for aggression and conquest; but the determination of monarchs and governments to preserve their territories intact in the face of increasing dissatisfaction with existing frontiers and conservative institutions made the competition in armaments more costly and more dangerous than it had been in previous generations.

Development of Rival Alliances.—It was the growing feeling of insecurity that led the European governments, one after another, to try to strengthen their positions by concluding alliances with other governments having similar interests. To Germany belongs the doubtful honor of inaugurating this system of alliances as well as the system of conscript armies, for it was Prince Otto von Bismarck, the principal author of the wars of 1864-1871 and German chancellor after 1871, who in 1879 made an alliance with Austria-Hungary and in 1882 brought about the Triple Alliance (q.v.) of Germany, Austria-Hungary, and Italy. These alliances were something new in the history of Europe, since in the past alliances had usually been concluded for specific purposes and were dissolved when the aim was accomplished; the alliance of France and Sardinia in 1859 to drive Austria out of Italy is an example. The alliances arranged by Bismarck were intended to be permanent; the Triple Alliance survived until 1915, and the Austro-German treaty until it was dissolved by military defeat in October 1918. According to the tradition of the balance of power (q.v.), which is centuries old in European history, the creation of a counterpoise to this grouping was to be expected. Bismarck was able to stave off such a counterpoise by clever diplomacy, first by the renewal of the Three Emperors' League (Germany, Austria-Hungary, and Russia) from 1881 to 1887, and then by the Reinsurance Treaty with Russia from 1887 to 1890, which kept France isolated. After his dismissal in 1890, however, his successor, Gen. Count Leo von Caprivi, rejected his system as too complicated, and in 1891-1894 a Franco-Russian alliance, which had been Bismarck's nightmare, came into being. One combination of powers dominated the center of Europe, while the other possessed the periphery.

Both of the Continental alliances were originally strictly defensive, providing for the maintenance of the status quo and for assistance only if one of the parties were attacked. Gradually, however, each alliance was altered. The Triple Alliance was modified to permit changes in the status quo in the Balkans, in Africa, and even in Europe; in the second treaty of the alliance, concluded in 1887, Germany promised under certain conditions to support Italian claims to Nice and Savoy (which had been ceded to France in 1860 as payment for French help in the war for Italian unification). In 1899 the Franco-Russian alliance was modified to provide for "the maintenance of the balance of power," the words being designed to take care of the situation which might arise when Austria-Hungary went to pieces, as it was confidently expected to do when Emperor Francis Joseph I should die. Finally, in 1909, the Austro-German alliance was given a new meaning when the chief of the German General Staff, Col. Gen. Helmuth von Moltke, in an exchange of letters with the Austrian chief of staff, Gen. Baron (later Field Marshal Count) Franz Conrad von Hötzner-

dorf, promised that if Austria invaded Serbia and Russia intervened on behalf of the latter, Germany would go to the help of Austria-Hungary. (In spite of many solicitations, Bismarck had consistently refused to make this promise, for he always insisted that Austria must not provoke Russia.) Thus the alliances ceased to be the guarantors of the status quo and might become instruments of aggression. Except in the case of the Austro-German treaty of 1879, the text of which was published in 1888, the terms of the Triple Alliance and the Franco-Russian alliance were closely guarded secrets which, so far as is known, were not penetrated by espionage or revealed by treachery. Although there was much speculation about the possible terms, the guesses were wide of the mark; the texts of the several treaties were not revealed until after the war, and in the absence of positive information the imagination had free rein.

Great Britain did not at first join either of the Continental groups, preferring a policy of "splendid isolation" or a "free hand." Although, according to the treaties of alliance, the two groups were directed against each other, in the 1890's they were more often concerned with diplomatic action against Britain; they stood, as it were, not face to face but side by side. In 1898 and again in 1901, Britain tried to reach an agreement with Germany, but the German terms were too high: Britain was asked to join the Triple Alliance, which it was unwilling to do because it was reluctant to underwrite what was later called the "ramshackle" Habsburg state. The German chancellor of the day, Count (later Prince) Bernhard von Bülow, was confident that in the end Britain must come to heel and stood on his terms. But in 1904, in the so-called Entente Cordiale (q.v.), Britain adjusted its many disputes with France in various parts of the world, and in 1907 it compromised its differences with Russia in the Middle East. Germany therefore found itself confronted by the Triple Entente of the three nations which it had believed impossible of realization. Europe was not mentioned in any of the agreements made by Britain with France and Russia, but by settling their own differences, they secured for themselves free hands in dealing with Germany.

The dominant position which Germany had hitherto occupied in Europe was further undermined by the action of Italy. In 1902, Italy had concluded a secret agreement with France by which it promised to remain neutral if the latter went to war with Germany in consequence of a German attack on Russia. Then, in 1909, Italy had reached a secret understanding with Russia by which both parties recognized each other's interests in the Balkans and promised support for each other's policies. Thus for some years the Triple Alliance was a broken reed, and in opposing the Triple Entente Germany was thrown back on Austria-Hungary as its one reliable ally and supported that ally in its dangerous Balkan policy.

Germany was slow to recognize that it had brought this situation on itself by its own mistakes. When the Entente Cordiale of 1904 permitted France to go ahead with its plans for obtaining control of Morocco, the German government raised strong objections to the French actions and by a covert threat of war (about which Bülow boasted in his memoirs) not only compelled the French foreign minister, Théophile

Delcassé, to resign (June 1905), but also forced France to submit the question of Morocco to an international conference, which was held at Algieras in January-April 1906. This proved to be a Pyrrhic victory, for not only did the conference on the whole support the pretensions of France, but the British government, which had been greatly worried by Germany's conduct, authorized the beginning of secret military conversations between the British and French general staffs. These conversations, which were not revealed until 1914, led to the formulation of plans for sending a British army of 160,000 men to fight alongside the French Army in case Britain decided to join France in war.

In 1911, Germany again challenged France over Morocco, which seemed to be passing under French control, and this time the German government sent a gunboat to the closed port of Agadir. The French were willing to negotiate, being prepared to buy off German opposition in Morocco by making concessions elsewhere in Africa. The German move made the British so uneasy, however, that a pacifist cabinet minister, David Lloyd George, delivered at the Mansion House in London a sensational speech to the effect that Britain was not to be ignored, a speech that angered the Germans but forced them to recognize that they could not ride roughshod over France. In the end a Franco-German compromise was reached whereby Germany gave up its aspirations in Morocco (which had never been clearly formulated) in return for two strips of French Equatorial Africa.

Nevertheless, the consequences of the Agadir crisis were far reaching. The German government promptly decided to increase its navy and refused to discuss a possible limitation of naval armaments unless Britain would promise to remain neutral in a European war. Not only did Britain decline to give any such promise, but in the summer of 1912 it entered into an agreement with France by which the entire French Fleet was to be deployed in the Mediterranean while the British Navy guarded the North Sea and the English Channel. Moreover, in November 1912, secret notes were exchanged between the British and French governments to the effect that if Britain should decide to participate in a European war, the plans drawn up by the general staffs would form the basis of action. The notes still left Britain free to decide whether to take part in a war, and it did not decide to do so until August 1914, but its decision was certainly made easier because of the secret military conversations. Thus German diplomacy was responsible for the expansion of the original Anglo-French entente into a close-knit diplomatic combination which did not exclude the possibility of resort to war.

Germany also acted unwisely toward Russia. In October 1908, when Austria-Hungary proclaimed the annexation of the Province of Bosnia and Hercegovina, Germany gave unqualified support to the action of its ally, and March 1909 forced the Russian government to accept the annexation by a threat to let matters take their course—that is, to let Austria attack Serbia. The Russian government did not forget or forgive this brutal German step, and in the next few years not only tightened its ties with France, but sought closer relations with Britain.

Actually, Anglo-Russian relations never achieved the intimacy prevailing between Britain

and France. Russian interests in the Balkans and the Middle East were never regarded in England as something Britain might have to fight for (as it was prepared to fight for French interests in Morocco), and Russian activity in Persia was much disliked and sharply criticized. When, in the spring of 1914, the Russian foreign minister, Sergei Sazonov, proposed that the Triple Entente be converted into a triple alliance, this invitation was declined by the British foreign secretary, Sir Edward Grey. Grey agreed, however, to the Russians' being informed of the Anglo-French notes exchanged in 1912 (which were then betrayed to the German government by a spy in the Russian embassy in London). He also agreed to the opening of conversations between the British and Russian admiralties; these conversations had barely started when the crisis of July 1914 broke out, but the Germans got wind of them and were much upset. Grey denied to the German ambassador in London that Britain was allied with France and Russia, but he admitted that it "did from time to time talk with them as intimately as allies." Thus in 1914 the Triple Entente had become a very tight diplomatic group.

In the autumn of 1912, when the small Balkan states pounced on Turkey and almost drove it from Europe, Germany manifested a change of front. While in general terms it stood by its Austrian ally, it did not push that ally to extreme action, it tried to bring about a compromise between Austria and Russia, and above all it worked in close association with Britain. The happy result was that, although the Balkan states quarreled among themselves and fought one another in 1913, the general peace of Europe was not broken. This Anglo-German cooperation was so striking and so successful that a similar course seemed indicated to solve the crisis of 1914.

In the course of the long Balkan crisis, Italy found it to its interest to work with Austria-Hungary for the establishment of an independent Albania, and in the winter of 1913-1914 new military and naval conventions with Germany and Austria seemed to bring the wavering ally back into the fold of the Triple Alliance. General von Moltke became convinced that Italy's loyalty was "not open to doubt," and he acted on that assumption, although the German Foreign Office did not, in the crisis of 1914.

Crisis of 1914.—At long last, in July 1914, the Triple Alliance and the Triple Entente stood face to face. Was war the inevitable consequence of this schism of Europe into two groups of great powers, three on each side? Certainly there was no immediate prospect of such a calamity, at least as far as western Europe was concerned. Relations between Britain and Germany were much better than they had been for some years, thanks largely to an informal agreement for the construction of battleships in the ratio of 16 to 10 and to the cooperation between the two governments during the Balkan crisis. By the spring of 1914 they had negotiated and were ready to sign the two agreements concerning the future of the Portuguese colonies and the completion of the Baghdad Railway. The British government assumed that, in the event of a new Balkan crisis, it could count on German help to deal with it; the German government had come to the conclusion that, in the event of war, Britain would not necessarily take the side of France, although the German ambassador in London re-

peatedly warned to the contrary.

After the great crises of 1905 and 1911, over Morocco, Franco-German relations had also taken a turn for the better. In February 1914, an agreement analogous to the Anglo-German bargain was reached concerning railway projects and spheres of economic interest in the Ottoman Empire; subsequently the president of the republic, Raymond Poincaré, who was later denounced in some quarters as a warmonger, broke the tradition of 40 years and dined at the German embassy. To be sure, Alsace-Lorraine had not been forgotten, but the German ambassador recognized that there was practically no sentiment for a war of revenge, and the elections of April-May 1914 gave a majority to the parties of the left, which were pledged to reverse the increase in military service from two to three years that had been effected in 1913; World War I broke out, however, before such action could be taken.

In midsummer 1914, then, both Anglo-German and Franco-German relations were more friendly than they had been for many years and contained no threat to peace. On the other hand, the Balkans and the Middle East were full of trouble. At the end of 1913 much tension had been produced between Russia and Germany by the dispatch of a German military mission under Gen. Otto Liman von Sanders to Constantinople for the purpose of rehabilitating the Turkish Army after the defeats of the Balkan Wars. For more than a century successive Russian governments had been fascinated by the problem of the Bosphorus and the Dardanelles, the straits which controlled the exit from the Black Sea to the Aegean. Several times Russia had succeeded in effecting an alliance with Turkey in order to send its warships through the straits, but in each instance it had been forced by circumstances to abandon the alliance, and in 1841 an international convention had closed the straits to the men-of-war of all nations except Turkey. On various occasions the Russian government considered the seizure of Constantinople by military force, but it never actually attempted to do so. At the end of 1913 it decided that Russian interests would be served by the continued existence of a relatively weak Ottoman Empire. Since the Liman von Sanders mission had for its object the strengthening of that empire, Sazonov was greatly disturbed and, although this was not known until after the war, revived the idea of seizing Constantinople, only to have it rejected both by his colleagues in the government and by the General Staff. Happily, a compromise was reached about the German mission, but public opinion in both countries remained excited.

In Albania its creators, Austria-Hungary and Italy, were busy trying to thwart each other and making life difficult for the newly appointed king, the German prince William of Wied. Bulgaria was sullenly nursing its defeat at the hands of Greece, Rumania, and Serbia in 1913, and was courting the favor of Austria. Greece and Turkey were at loggerheads over certain islands of the Aegean. But the spark that set off the explosion in the Balkans was a completely unexpected incident, the assassination of Archduke Francis Ferdinand and his wife on Sunday, June 28, 1914.

That tragedy was the culmination of an antagonism between Austria-Hungary and Serbia that had been growing for a generation. In 1859, Austria had faced the question of Italian unifica-

tion, and had been driven out of Italy; in 1866 it had faced the same problem in Germany, with disastrous results. Beginning in 1903, when there was a change of dynasty in Serbia, it was confronted by the Yugoslav problem, which was certainly not easy to solve. Historically, the Yugoslavs had never been united. They consisted of three branches: the Slovenes, Roman Catholics using the Latin alphabet, who lived under Austrian rule in Carinthia and Carniola and were often at odds with the Germans; the Croats, also Roman Catholics using the Latin alphabet, living mostly in Croatia, a province of Hungary, but also in Dalmatia, an Austrian province, in which the Italian element was favored by the Austrian authorities; and the Serbs, members of the Orthodox Eastern Church using the Cyrillic alphabet, living chiefly in independent Serbia and Montenegro, but also in Bosnia and Hercegovina under joint Austro-Hungarian rule, where many of them were Muslims, and in Old Serbia, which was still a part of Turkey. Serbo-Croat was one language, written in both alphabets; Slovene was a kindred language. By 1914 it was evident that a national movement in favor of uniting the various branches of Yugoslavs was getting under way within the Habsburg state because of their discontent with the shabby treatment they had received from the Austrian and Hungarian governments. At the same time, those Serbs who were independent began to dream of drawing their kinsmen under Habsburg rule into their own state. Naturally, the ruling groups in Austria-Hungary hoped to prevent this, and they aspired to bring Serbia into the monarchy.

In 1881, Milan IV Obrenovich (Obrenović), then prince of Serbia, had concluded a secret treaty with Austria-Hungary which placed his little country under the control of Vienna and paved the way for economic subjection. This situation lasted until 1903, when Milan's son and successor, King Alexander I, was murdered by a group of army officers who resented the humiliation of their country. Since Alexander had no heir, the throne passed to Peter Karageorgevich (Karadjordjević), whose ancestor had organized the revolt of Serbia against Turkish rule in 1804. Abandoning the autocratic methods of Alexander, Peter became a constitutional monarch and allowed the Radical Party, under Nikola Pašić, to govern. The Radicals managed to free Serbia from the economic domination of Austria-Hungary and to acquire the goodwill of Russia, traditionally the opponent of Austria in Balkan affairs. The spectacle of little Serbia defying mighty Austria made a strong appeal to the Yugoslavs within the Dual Monarchy, who were unable to obtain concessions from Vienna and Budapest.

This new situation forced the ruling elements of the monarchy to consider the problem afresh. The military party, led by Conrad von Hötzendorf, urged war against Serbia, which would have led to direct annexation of the defiant little neighbor. The political leadership was more cautious, knowing that war might provoke Russian intervention, and contemplated a customs union or a change of dynasty, which might be accomplished by diplomacy, but it was just as eager as the soldiers to extinguish Serbian independence and thus beat down the restlessness of its own Yugoslav population. As a first step in this direction, Austria-Hungary in October 1908 proclaimed the annexation of Bosnia and Hercegovina, lands with a mixed population of

Serbs and Croats which had been under Habsburg occupation and administration since 1878 but were nominally still parts of the Ottoman Empire (where the revolution of July 24, 1908, had overturned the absolute rule of Sultan Abdul Hamid II). This action precipitated a five months' crisis involving Austria's relations with Turkey, the great powers, and Serbia; it almost resulted in an Austrian attack on Serbia and came to an end only after Germany had sent its near-ultimatum to Russia, requiring it to recognize the annexation without reference to a European conference. The Russian foreign minister, Alexander Izvolski, accused the Austrian foreign minister, Baron (later Count) Alois Lexa von Aehrenthal, of having tricked him, and he bitterly resented the intervention of Germany.

The echoes of this conflict had not died away in 1914. Although Austria compelled Serbia to recognize the annexation, it was another Pyrrhic victory, for the Serbs retaliated by forming two societies: one, Narodna Odbrana (National Defense), was public; the other, Ujedinjenje ili Smrt (Union or Death), popularly known as Crna Ruka (Black Hand), was secret and had been formed for propaganda and agitation in Bosnia against Habsburg rule. A revolutionary movement known as Mlada Bosna (Young Bosnia) also sprang into existence and inspired more than one attempt to assassinate Austro-Hungarian officials in Bosnia and Croatia. The ruling classes in the monarchy were deeply disturbed by this unrest, which they were unable to curb or to suppress.

In the plans of the Austro-Hungarian government for dealing with the Yugoslav problem, Archduke Francis Ferdinand played a peculiar role. He was convinced that the existing system of dualism, whereby Germans ruled in Austria and the Magyars in Hungary, although both were minorities, was driving the Habsburg state to destruction; in particular, he hated the Magyar ruling clique and hoped to break its power. He proposed to solve the Yugoslav problem by granting to the Yugoslavs within the monarchy, whether they lived in Austria, Hungary, or Bosnia, full autonomy and unity, which would mean the end of dual rule; he then hoped to bring Serbia into some kind of connection with the monarchy. No one can say whether the archduke would have been able to carry out his somewhat nebulous plans had he lived to succeed his uncle Francis Joseph in 1916. He was hotheaded, bigoted, avaricious, and disliked by large numbers of his future subjects, and any attempt to carry out his plans would have met with determined resistance by both Germans and Magyars. But his violent death at the hands of a man of Serbian stock, though a Habsburg subject, provided the forward party in the Austro-Hungarian government with an excuse for action against Serbia that was too tempting to neglect.

Many details of the crime at Sarajevo have never been revealed. That the assassins—Gavrilo Princip, who did the actual killing, and two others—came from Bosnia and hated Francis Ferdinand as the symbol of Habsburg oppression, were supplied with arms in Belgrade, and secretly passed across the frontier into Bosnia, became known in 1914 and was used by the Austro-Hungarian government as justification for its demands on Serbia. The person most often credited with inspiring the crime was the chief

of the intelligence section of the Serbian General Staff, Col. Dragutin Dimitrijević, but the evidence is not conclusive. How much the Serbian government knew about the plot in advance, and what steps, if any, it took to prevent the execution of the crime either by warning the Austrian government or by attempting to stop the assassins from crossing into Bosnia—these are questions to which no sure answer is possible; the present government of Yugoslavia, successor to the Serbian government of 1914, has not opened its archives, and there are many conflicts in the unofficial evidence that is available. Equally uncertain is the reason why the authorities in Sarajevo did not take proper precautions to protect the heir to the throne. Actually, the answers do not matter, for an official sent from Vienna to Sarajevo reported that the responsibility of the Serbian government was not established; nevertheless, the action of Austria-Hungary could hardly have been more drastic if the official complicity of Serbia had been proved.

The situation in 1914 cannot be judged, however, exclusively in terms of Austro-Serbian relations. Serbia, though a small nation with a population of less than 5,000,000, enjoyed the friendship of Russia and occupied a key position in Europe. Rumania was the ally of Austria-Hungary; Bulgaria was anxious to be admitted to the Triple Alliance; in Turkey, German political and military influence was stronger than that of any other power. If Serbia could be brought under Austrian control, then German-Austrian influence would prevail from Berlin to Baghdad. If, on the contrary, Serbia could be maintained as an independent state, a wedge would be driven into the German-Austrian-Bulgarian-Turkish combination, and Constantinople would be susceptible to Russian, French, and British pressure. So the crisis of July 1914 was concerned with far more than the question whether, as Austria-Hungary demanded, Austrian officials should go into Serbia and investigate the details of the crime at Sarajevo. The issue was a test of strength between the Triple Alliance and the Triple Entente; at stake was the balance of power in Europe for an incalculable time to come.

3. War Declared

Although all the European governments were responsible in greater or less degree for the development of the system of alliances and for the huge accumulation of armaments, and to that extent contributed to the tension that came to a head in July 1914, they were not equally responsible for the fatal outcome of the crisis. Immediately after the war began, the governments began to issue collections of diplomatic documents; these came to be known by the colors of the covers in which they were bound: the German collection as a White Book, the Austrian as a Red Book, and the Russian, French, British,

Belgian, and Serbian as Orange, Yellow, Blue, Gray, and Blue Books, respectively. Each government set forth its case in these books and laid the blame for the war on the enemy; it sought not only to convince its own people of the rightness of its conduct, but to obtain the goodwill of neutral countries, especially the United States.

All during the war hot debate raged over this question of war guilt. *The Evidence in the Case* (1914), a book by James Montgomery Beck, an eminent American lawyer, placed the blame for the war primarily on Germany and enjoyed a wide circulation. After the war, when secret archives began to be opened, much fuller collections of documents were published, and these were selected by historians rather than by politicians and propagandists. It was then seen that the documents issued in 1914 had been chosen to make out a case, and that they had often been tampered with. Sometimes texts had been changed, awkward documents had been omitted, and occasionally documents had been fabricated to order. From the fairly complete diplomatic files of the Austrian, British, French, German, and Russian governments now available, together with the memoirs of politicians, diplomats, military men, and journalists, it is possible to write a dispassionate and accurate account of European diplomacy from the murder of Archduke Francis Ferdinand and his wife at Sarajevo on June 28, 1914, to the outbreak of the general European war in August.

The Austrian Ultimatum and the Role of Germany.—The Austro-Hungarian government quickly decided that the heaven-sent opportunity for a reckoning with Serbia was not to be lost. Inasmuch as action against Serbia might lead to the intervention of Russia, however, the cabinet of Vienna wished to know what Germany was prepared to do in such a situation. Although the German General Staff had declared in 1909 that Russian intervention to help Serbia would cause Germany to mobilize (in German terminology, this step was the prelude to war), the German government had steadily restrained the war party in Vienna during the Balkan Wars of 1912–1913. Furthermore, the German emperor, William II, was suspected of being partial to Serbia. In order to ascertain the state of mind in Berlin, Emperor Francis Joseph I therefore wrote a letter to William, stating that Austria-Hungary must aim at the “isolation and diminution of Serbia,” which must be “eliminated as a political factor in the Balkans.” The Austro-Hungarian foreign minister, Count Leopold von Berchtold, drew up a long memorandum which urged that Bulgaria, Serbia’s bitter enemy, be admitted into the Triple Alliance, and stated that it was “imperative” for the monarchy to take strong action against Serbia. What action was contemplated was explained orally by a special emissary sent from Vienna to Berlin, Count Alexander von Hoyos, who said that the plan was to “march into Serbia” without any warning and then to partition it between Austria-Hungary, Albania, and Bulgaria.

Only two weeks before, the German chancellor, Theobald von Bethmann-Hollweg, had said that, in the event of a new crisis arising in the Balkans, “whether . . . it would come to a general European conflagration would depend exclusively on the attitude of Germany and England.” When Hoyos appeared in Berlin on July 5, however, this caution was forgotten.

The Austrian plan to invade and partition Serbia was cordially received by the German emperor and the German government, and immediate action was urged on the Austro-Hungarian government. Because a royal personage had been killed, William II believed (so he asserted) that Czar Nicholas II would not go to the help of Serbia, but if he did so, Germany was ready to support Austria and wage war against Russia and France. This decision by William revealed at its worst the personal rule of the emperor, who did not consult his chancellor or his military advisers; he "told" them what he had done and left them to face the consequences, and they lacked the power, or the will, to reverse his decision. It is worth noting that the German embassy in Russia was not asked whether the emperor's interpretation of the czar's state of mind was correct. Seldom if ever was a decision of the highest importance reached with more haste and recklessness. William and Bethmann-Hollweg accepted the risk of war with unbelievable nonchalance; it was they who put the system of European alliances to the test.

The decision was not a matter of Germany's putting its head into a noose (as was sometimes asserted) and then being strangled; both emperor and chancellor had been informed of the Austro-Hungarian plans and knew what they were supporting. Their assumption that Britain would remain neutral in a European war was contrary to what their ambassador in London had been saying for 18 months. The German General Staff was confident that Germany and Austria-Hungary could defeat Russia and France; it assumed that war was inevitable and welcomed the prospect, for victory would be easier in 1914 than in 1917, when French and Russian military reorganization would be completed. It was not alarmed by the possibility of British intervention, for it expected that such intervention would be delayed, or that, if it came immediately, the small British Army would be overwhelmed by the German legions advancing through Belgium and France. Some conservative circles in Germany (Bethmann-Hollweg mentions this) regarded war as a good method of dealing with the menace of socialism, which seemed to be steadily increasing. The idea of consulting the elected representatives of the German people in the Reichstag apparently occurred to no one.

The foreign policy of Germany had long vacillated between east and west. From 1890 to 1914 (that is, from the dismissal of Prince Otto von Bismarck as chancellor to the outbreak of war), the German government pursued a policy of expansion in both directions. Admiral Alfred von Tirpitz and the Navy League considered Britain the enemy and advanced the building of the fleet, although the more they built the more they drove Britain into the arms of France and Russia. To the General Staff, France was the eternal enemy, and the army therefore was steadily expanded. Businessmen were divided, some looking to Africa and the colonial empires of Britain and France, while others preferred the Middle East, where the Baghdad Railway was the symbol and instrument of German expansion. The emperor and his chancellors never made up their minds where the fundamental interest of Germany lay; they acted as if they thought that Germany was strong enough to move both east and west. In 1914 they were seriously concerned about the future

of Austria-Hungary, their one reliable ally, and they persuaded themselves that only a military expedition against Serbia could stop the decay of the Habsburg empire even though the German ambassador in Vienna was highly skeptical about its possibility of survival. The reason officially offered by the German government for its action was the necessity of aiding its hard-pressed ally. The decision to act thus, in the calculation that Britain would remain neutral, may be interpreted as meaning that the long vacillation had been ended at least temporarily by a decision to go east.

The Austro-Hungarian government was now free to act, but the opposition of Count István Tisza, the Hungarian premier, forced Berchtold to abandon his plan to march into Serbia, and a Council of Ministers held on July 7 decided on a 48-hour ultimatum, which theoretically would offer Serbia a chance to submit. Actually, seven supposedly unacceptable demands were incorporated in the note so as to ensure the rejection of the ultimatum and open the way to military action. As the minutes of the meeting reveal, the treatment intended for Serbia included "rectifications of frontier" for the benefit of Austria-Hungary, while other parts of its territory were to be allotted to Bulgaria and Albania; what was left of Serbia was to be attached to the monarchy by a military convention to be signed by a new dynasty. These designs were naturally not mentioned when the Austro-Hungarian government later declared to the other powers that it did not intend to take Serbian territory for itself.

The ultimatum, probably the most formidable document which had yet been addressed by one independent state to another, was presented to the Serbian government on July 23. It contained 10 demands, the most important of which required Serbia to admit Austrian officials in order to suppress agitation against the Dual Monarchy and to take action against the persons involved in the murder at Sarajevo. Outside of Austria-Hungary and Germany the note was regarded as a monstrous document which no independent state could accept. To the complete surprise and intense annoyance of Vienna, the Serbian reply, delivered on July 25 a few minutes before the expiry of the ultimatum, was conciliatory and to a large extent appeared to accept the Austrian demands, as was later stated by both the German emperor and the German chancellor. Nevertheless, the Austrian minister, after a cursory reading of the document, broke off diplomatic relations and left Belgrade; later in the day, partial mobilization of the Austrian Army was ordered. Three days later, on July 28, 1914, Austria-Hungary declared war against Serbia—the fateful decision from which all subsequent troubles derived. The military chiefs wished to wait until mobilization had been completed, but strong German pressure forced immediate action, which began with the bombardment of Belgrade on July 29.

Russian and German Intervention.—The Austrian action precipitated the intervention of Russia. Although for generations the principal Russian interest in the Balkans and the Middle East had been the question of the Bosphorus and the Dardanelles, that question was dormant in July 1914. The Russian move was determined by the other facet of its policy in the area: the tradition of defending the Slavic peoples of the

The Bettmann Archive

Above: Order to mobilize German Army for war on Russia is read to a crowd in Berlin on Aug. 1, 1914. Right: Declarations of war from July 28 to Aug. 4, 1914, are headlined in the newspapers of Great Britain, the United States, Germany, and France.

Balkan Peninsula against Turkish misrule or German (Austrian) pressure. Since the annexation of Bosnia and Herzegovina in 1908, Serbia had looked to Russia for help against Austria-Hungary, but Russia had not fully recovered from its defeat by Japan and the abortive revolution of 1905, and Foreign Minister Alexander Izvolski and his successor, Sergei Sazonov, put off the importunate Serbs with promises for the future. The Russian government probably did not want war in 1914, for its army was undergoing reorganization, and revolutionary symptoms (notably in the form of strikes) were again in evidence. Nevertheless, it had to help Serbia or see that country crushed by Austria.

Such an eventuality was contrary to the interest of Russia and was strongly opposed by Russian public opinion. Sazonov believed (correctly, as we now know) that the Austrian assurances of disinterestedness were equivocal and insincere. He tried to have the terms of the Austrian ultimatum modified, but to no avail; when he learned of the bombardment of Belgrade, he ordered the partial mobilization of the Russian Army on July 29. This decision, like the German decision of July 5 and the Austrian decision of July 25, was taken without proper reflection, but its purpose was to make clear that Russia would act if Austria attacked Serbia in earnest (the Austrians did not plan to attack until August 12, but this was not known in St. Petersburg). Sazonov's calculations doubly

misfired. First, the news of partial mobilization did not deter Vienna (and Berlin) from the course chosen. In the second place, the Russian General Staff, which had not been consulted, had no plan for partial mobilization and convinced the foreign minister that it was impracticable, and that general mobilization must be ordered. Nicholas II, with whom the final decision rested, wavered, giving his consent on the evening of July 29 and then withdrawing it. On July 30, he agreed, however, and the order was published on July 31.

The Russian general mobilization was ordered in the knowledge that it would be followed by German mobilization, as the German government had stated; in the German view, this meant war. Neither Austria nor Russia regarded mobilization as necessarily meaning war. Germany took that position because it planned to attack France first, defeat it in six weeks, and then turn on Russia; therefore, so the German argument ran, Germany could not afford to let Russia mobilize but must strike at once. In a sense, then, Russia "willed the war" when it ordered mobilization, and the Italian historian Luigi Albertini thought that the mobilization was premature, for by July 30 the British government had come forward with a plan that might have led to compromise and peace. Inasmuch as Germany had forbidden even a partial Russian mobilization, however, Russia had to mobilize or abdicate as a great power. The czar promised that his armies would not attack so long as ne-

negotiations continued, but these assurances seemed as dubious to Germany as the Austrian assurances about the integrity of Serbia seemed to Russia.

At the beginning of the crisis, Germany urged that the Austro-Serbian conflict be "localized," lest the operation of the system of alliances turn it into a general war, and refused to restrain its ally, which, in fact, it urged to act quickly. From the start the plea of localization was rejected by Russia, France, and Britain because they could not afford, as they saw their interests, to let Serbia be crushed. The German government also rejected a British proposal for a conference in London to try to find a solution for the Austro-Serbian conflict.

On July 28, the day on which Austria declared war on Serbia, the German emperor changed his mind. He decided that the conciliatory Serbian reply had removed "every reason for war," and he proposed that Austria stop with the occupation of Belgrade and offer to negotiate. On the following day, the British government came forward with an almost identical proposal. By this time it began to seem likely that, contrary to the original German calculations, Britain would be drawn into the war. So the German government, on the evening of July 29, shifted its ground and advised Vienna to accept the British proposal. Before the Austrian government had replied, rumors of Russian mobilization began to reach Berlin, and the chief of the German General Staff, Col. Gen. Helmuth von Moltke, pressed for war (as is admitted by the two most objective German students of the crisis: Herman Lutz, in *Die europäische Politik in der Julikrise 1914*, 1930; and Alfred von Wegerer, in *Der Ausbruch des Weltkrieges 1914*, 2 vols., 1939). On the evening of July 30, he persuaded the chancellor to relax the pressure on Berchtold to accept the British proposal, and he himself telegraphed to the Austrian chief of staff, Gen. Baron (later Field Marshal Count) Franz Conrad von Hötzendorf, urging the rejection of the proposal and promising Germany's full support if war resulted. Vienna did as Moltke desired and ordered Austrian general mobilization on July 31, before news had been received of the Russian general mobilization.

According to Gen. Erich von Falkenhayn, the Prussian minister of war, Germany could have waited a few days before reacting to the Russian general mobilization. When official news of this step reached Berlin on the morning of July 31, however, Moltke, with the help of William II (who had experienced another change of mind), secured the consent of Bethmann-Hollweg, who had been resisting the generals, to the proclamation of a *Kriegsgefahrzustand* (state of danger of war). This was the necessary preliminary to formal mobilization, which was ordered on the following day, August 1. Whether, without the intervention of Moltke, Austria would have accepted the British proposal, and whether a compromise with Russia could have been reached, no one can say; but it is clear that Moltke's interference prevented any last-minute negotiations in the interest of peace.

The Roles of France, Britain, and Italy.—Although the German-General Staff planned to begin the war with an attack on France, Germany had no dispute with that country in 1914. In order to have an excuse for such an attack, the General Staff declared the Russian mobili-

zation a *casus belli*, and France was asked if it, as the ally of Russia, would remain neutral. If France replied in the negative, as was expected, Germany would have a justification for making an attack. But events did not follow that course.

Germany declared war on Russia on August 1, which allowed the Russian government to say that it had been attacked when it was ready and eager to negotiate. According to the Franco-Russian alliance, the German attack on Russia required France to attack Germany, but the French government, in reply to the German demand for neutrality, said on August 1 that it would consult its interests, an answer explained by the determination of the government not to appear as an aggressor. The French reply did not stop the German armies from invading France; and on August 3, Germany declared war on France, alleging untruthfully that French planes had bombarded Nürnberg. Thus France as well as Russia appeared to be the victim of brutal aggression, a circumstance of great value in consolidating sentiment at home and winning help abroad.

France's part in the crisis of 1914 was almost automatic. While it had no direct interest in Serbia, it was the ally of Russia, and if it did not stand by that country, the alliance would be broken and France would be left isolated, possibly to face a repetition of the German challenges of 1905 and 1911. At the moment when the Austrian ultimatum was presented in Belgrade, President Raymond Poincaré and Premier René Viviani were paying a state visit to Russia, and they gave the czar and his ministers the promise that France would support Russia in opposing Austria-Hungary and Germany, a promise that certainly strengthened the resolution of Sazonov. Later, after the two Frenchmen had returned to Paris, the French government urged its ally to do nothing that would provide Germany with an excuse for war, but it did not object to any action taken by Russia. This attitude was so firmly supported by all shades of French public opinion that the government did not feel it necessary to reveal the terms of the Russian alliance. Thus both Germany and France supported their allies on an issue not of direct concern to themselves—Serbia; and so an Austro-Serbian quarrel became transformed, in the interest of the balance of power and by the operation of the system of alliances, into a general European war.

The role of Great Britain, on the other hand, was anything but automatic. The crisis found the Liberal government facing the prospect both of a general strike in England and of a civil war in Ireland over the question of home rule, possibilities which may have contributed to convince the German government that Britain would remain neutral. Actually, as soon as the European situation became ominous, the idea of a general strike faded away and the Irish controversy was adjourned, both Irish parties supporting the government in its efforts for peace. Sir Edward Grey, the foreign secretary, made various proposals for delay, discussion (by a conference of ambassadors in London meeting with himself), and compromise; all were rejected by Austria-Hungary and Germany.

The British government was asked by Germany to accept the principle that the Austro-Serbian conflict should be localized, with Britain

proclaiming its neutrality, and by Russia and France to declare its solidarity with them as the only means of restraining Germany from war. Grey, along with the prime minister, Herbert Henry Asquith (later 1st earl of Oxford and Asquith), and some other members of the cabinet, notably Winston Churchill, then first lord of the admiralty, believed that Russia could not be expected to stand aside and abandon Serbia. In the interest of future relations between Britain and Russia, Grey accordingly refused to exert pressure on the latter to do so or to advise against Russian mobilization. These cabinet members also believed that an Austro-German victory in the coming struggle would establish an ascendancy of Germany in Europe that would be dangerous for Britain. On the other hand, they could not announce British solidarity with Russia and France because at the beginning of the crisis a majority of the cabinet opposed British participation in the war, and this view was shared by most of their supporters in Parliament and by the country at large. At the time, even the military conversations of 1906 and the notes exchanged with France in 1912 were still secret.

Grey therefore had to conduct his policy, not according to his convictions of what the interests of Britain required, but in the light of what public opinion would support. He privately told the German ambassador that, in the event of war, Britain would be drawn in, and it was this statement which led the German government to modify its stand, but he apparently did not inform the cabinet of what he had done. It was not until Germany had declared war on Russia and had sent an ultimatum to France that, on August 2, Britain promised the latter that it would help defend the northern French coast against German attack. Even this promise was made dependent on the approval of Parliament and could be given only because the Conservative opposition agreed to support it. Since Germany had promised not to attack the French coast, the British promise would probably not have been put to the test if the former had not violated the neutrality of Belgium.

This reversed the situation immediately, for the German action convinced the cabinet, Parliament, and the country that it was necessary for Britain to enter the conflict, which it did with a declaration of war on Germany on August 4. Grey was later criticized for not making clear to Germany much earlier than he did that the violation of Belgian neutrality would be a *casus belli* for Britain. In all probability, however, this would have been to no avail. The German General Staff had only one plan for fighting the war, a plan which involved going through Belgium; Moltke, being confident that he could deal with a British army, desired rather than feared British intervention, and he could not have improvised a new plan on the spur of the moment. It was true, as Germans often asserted that for Grey the German action against Belgium was not the reason he wished Britain to participate in the war, which he urged on general grounds, but without the Belgian issue the British government probably could not have induced the British people to go to war in August 1914.

Ever since that time, the question has been debated whether a clear-cut declaration of British solidarity with France and Russia would have

prevented the war, but there is no agreement among the publicists, diplomats, and historians who have written on the subject. All that can safely be said is that Grey thought it impossible to make such a declaration and never proposed it to the cabinet. (Mindful of this controversy, the British government of 1939 did inform Germany that it would go to the help of Poland, but this did not stop Adolf Hitler from attacking that country.)

Italy, the sixth great European power, though the ally of Austria-Hungary, disapproved of the latter's actions from the start. If Italy's own struggle with Austria was any guide, Habsburg power probably could not suppress the Yugoslav national movement by force, but if it did succeed in doing so, Italian interests in the Adriatic would be affected. In addition, Italy did not wish to expose its long coastline to the British Fleet. The Italian government took advantage of the failure of Austria, contrary to Article 7 of the treaty of the Triple Alliance, to notify its ally in advance of its projected action and to settle the matter of compensation. On August 3, it declared that Austria and Germany were waging a war of aggression and proclaimed its neutrality; this action was of immense importance to France, which was enabled to withdraw its troops from the Italian frontier and send them against Germany.

The Possibilities of Peace.—Previous diplomatic crises involving Morocco or the Balkans had lasted weeks or even months, during which period diplomacy had time to function. In 1914 only 13 days elapsed between the Austrian ultimatum to Serbia and the beginning of general war. Austria-Hungary and Germany hoped to force the other powers to accept their violent action against Serbia. To meet this situation, which took them by surprise, Russia, France, and Britain resorted to improvisation, with not too happy results. Sazonov and Grey made new suggestions almost daily, before their previous proposals could have been considered, so that the diplomatic situation became increasingly obscure. The confusion reached its height on August 1, when Germany declared war on Russia at the moment when both that country and Austria were reported to be willing at last to negotiate. A little time was needed to determine what the situation actually was, but just as diplomats had previously made decisions without sufficient reflection, so now the military authorities, thinking in terms of mobilization timetables, began to take over from the civil authorities. The three emperors, Francis Joseph I, Nicholas II, and William II, all hesitated for a long time before they consented to the irrevocable measures of mobilization and declarations of war; unfortunately, the first was almost senile, the second weak, and the last volatile and impetuous. Furthermore, among the statesmen who had to make the decisions, there was no outstanding personality—no Camillo Benso di Cavour, no Otto von Bismarck, no Benjamin Disraeli—who could or did dominate the situation.

In the years from 1871 to 1914, peace was maintained in Europe by the combination of alliances and armaments. In the crises before 1914—in 1875, 1887, 1905, 1908–1909, 1911, and 1912–1913—governments did not go to war because they were not ready for war, were not sure of the support of their allies, or did not think the issues worth fighting for. In 1914

the balance of power was at stake for an indefinite time ahead, and the governments were more nearly ready for war than they had ever been. Austria-Hungary and Germany were determined on a military solution of the Serbian problem and wished to upset the status quo; Russia, France, and Britain were prepared to accept a diplomatic humiliation of Serbia but not its military subjugation, and while they were not committed to the status quo, they were not willing to let it be altered without their consent. Thus the system of alliances, which had originally served the cause of peace, operated almost mechanically in 1914 to convert a local conflict into a general war.

Likewise, great armaments had helped to keep the peace, provided they were not used. The instant one power began to mobilize in order to strengthen its diplomatic position, however, military men everywhere became nervous, for no general staff was willing to let a rival get much of a start. "Once the dice were set rolling," as Bethmann-Hollweg put it, nothing could stop them.

For subsequent declarations of war, see sections 15. *Diplomatic History of the War* and 17. *Chronology—Declarations of War*; consult also historical sections of separate articles on the various belligerents and biographies of the leading statesmen.

4. Comparative Strength of Belligerents

Economic Power.—By 1914, Great Britain, France, Germany, Italy, and the United States had become highly industrialized nations. Raw materials not available at home were readily obtainable in other lands, and adequate shipping had been constructed to meet transportation needs. The principal limitation to the capacity of these nations to produce armaments was a shortage of skilled workers. Japan and Belgium also had made great strides in industrialization, but Russia lagged behind and required major assistance from her allies to meet her war needs. Germany bore the additional burden of supporting her allies: Austria-Hungary required substantial aid, and Bulgaria and Turkey were almost wholly dependent on Germany for war materials.

At the outbreak of war, Germany lost her colonial empire, and, hemmed in by the Allied naval blockade, the Central Powers were in danger of strangulation. Moreover, the Allies waged intensive economic warfare to stifle the trade of the Central Powers with neutral European countries. Under these conditions the outlook for the Central Powers was dark, but they made up most of their deficiencies through territorial expansion and the exploitation of the resources of captured Allied areas. Their offensive in western Europe gave them control of Belgium and of the heavily industrialized area of northern France. They thereby gained the major portion of French steel, iron, coal, wool, and sugar production. Later, they acquired the resources and facilities of Russian Poland, Serbia, and Rumania, and when Russia collapsed in 1917, the rich granaries of the Ukraine and the Russian Baltic provinces also came under their control. Despite the Allied blockade and measures of economic warfare, the Central Powers were therefore capable of engaging in a long war. Shortages of skilled workers

were compensated for in large measure by the employment of women, who were found to be adept in many delicate phases of industrial production. The Allies also took advantage of these skills of women but to a lesser extent. When the United States with its vast resources and industrial capacity joined actively in the war, the balance of economic power swung sharply in favor of the Allies.

Manpower.—The greater population of the Allied countries gave them a distinct advantage over the Central Powers in the mobilization of manpower. The accompanying table presents an estimate of the numbers of men in the standing armies and trained reserves of the various belligerents when they entered the war and of the total number of men mobilized during the war.

MOBILIZED MANPOWER OF BELLIGERENTS

Countries	Standing armies and trained reserves	Total mobilized forces
Allies:		
Russia	5,971,000	12,000,000
France ¹	4,017,000	8,410,000
Great Britain ¹	975,000	8,905,000
Italy	1,251,000	5,615,000
United States	200,000	4,355,000
Japan	800,000	800,000
Rumania	290,000	730,000
Serbia	200,000	707,000
Belgium	117,000	267,000
Greece	230,000	230,000
Portugal	40,000	100,000
Montenegro	50,000	50,000
Total	14,141,000	42,189,000
Central Powers:		
Germany	4,500,000	11,000,000
Austria-Hungary	3,000,000	7,800,000
Turkey	210,000	2,850,000
Bulgaria	280,000	1,200,000
Total	7,990,000	22,850,000

¹ Including colonial troops.

Armament.—Neither side had unusual difficulties in meeting the needs for armament and equipment for their field armies. Industrialization had not progressed far in Russia, however, and she required substantial aid from her allies. The armament of the opposing forces was generally similar. Except for the tank, no revolutionary types of infantry or artillery weapons were introduced during the war. The Germans did construct a long-range gun, known as Big Bertha (q.v.), with which to shell Paris from a distance of 74 miles, but its effect was only one of harassment. Both opponents emphasized the machine gun, which, when used in conjunction with barbed wire and trench systems, was highly effective against infantry assaults. The artillery weapons of the opposing forces were largely comparable, but the French 75-mm. gun (especially when used by Frenchmen) was the deadliest weapon on the battlefield. The Germans respected it highly, and the American Expeditionary Force was equipped almost entirely with this weapon. With the introduction of the airplane on the battle scene, anti-aircraft guns of up to 75-mm. caliber were developed in limited quantities by both sides.

The Germans tried to gain a decisive advantage by the employment of poison gas. When it was first used as the Second Battle of Ypres in 1915, it caused panic among the Allied troops at the front, and they fled. The German troops ran into their own gas, however, and halted the attack. Countermeasures were soon developed, and though both sides employed gas occasionally

throughout the war, its use had only nuisance value.

The Allies won a decided advantage with the development and introduction of the tank by the British in 1916. It was first used in the Battle of the Somme, where the approach of the monsters caused the German troops to drop their arms and flee in terror. The results of this first tank attack were not great, for only 36 units were employed, but the potentialities of the new weapon were readily recognized, and all the major powers hastily began to build them. The production of the Germans lagged, however, and they were never able to assemble enough tanks for a decisive drive. In contrast, Allied production and improvement of the tank advanced rapidly as the war progressed. In 1918 mass attacks by as many as 500 Allied tanks were not unusual, and they exerted a decisive influence on the outcome of operations. The tank played a major role in breaking the stalemate on the western front and in bringing the war to an end.

Airpower.—Airpower was in its infancy at the beginning of the war, for the types of aircraft available were crude and limited in purpose. The Germans had about 380 planes and 30 dirigibles (called zeppelins after their designer, Count Ferdinand von Zeppelin); the French had 120 planes and 10 dirigibles; and the British had a comparable small number of planes, with about 60 assigned to the British Expeditionary Force in France. Russia possessed only a few planes; and the United States as late as April 1917, when she entered the war, had only 55 planes, all of which were obsolete or obsolescent. Originally, the military purpose of the airplane was to provide observation and reconnaissance on the battlefield. When it was found possible to synchronize the firing of an automatic gun through a rotating propeller, the true value of aircraft as a fighting weapon was appreciated, and the race for construction began. Improved designs led to planes capable of carrying heavy loads. These were converted into bombers, and large bombs were produced. Initially, the Germans emphasized zeppelins, and their heavy bomber production lagged. Many zeppelin raids were conducted over France and England in 1915 and early 1916, but the dirigibles then became easy prey for the improved types of Allied fighter planes, and their construction was discontinued. German bomber production never equaled that of the Allies. Although their bombers struck London a few times and attacked installations on the Continent, the effect fell far short of the results achieved by the superior Allied formations. In view of the greater Allied production capacity, the Germans were generally at a disadvantage in the air on the western front except for occasional local concentrations in support of particular attacks. The aircraft production of Russia was small, and she was frequently inferior to the Germans on the eastern front. Toward the end of the war, Allied attacks on parts of the western front were supported by fleets of as many as 1,500 fighters and bombers attacking front-line troops and rear supply installations.

Many thousands of aircraft were produced during the war. Since available production figures often comprise all types of aircraft, including civilian planes, it is difficult to secure accurate

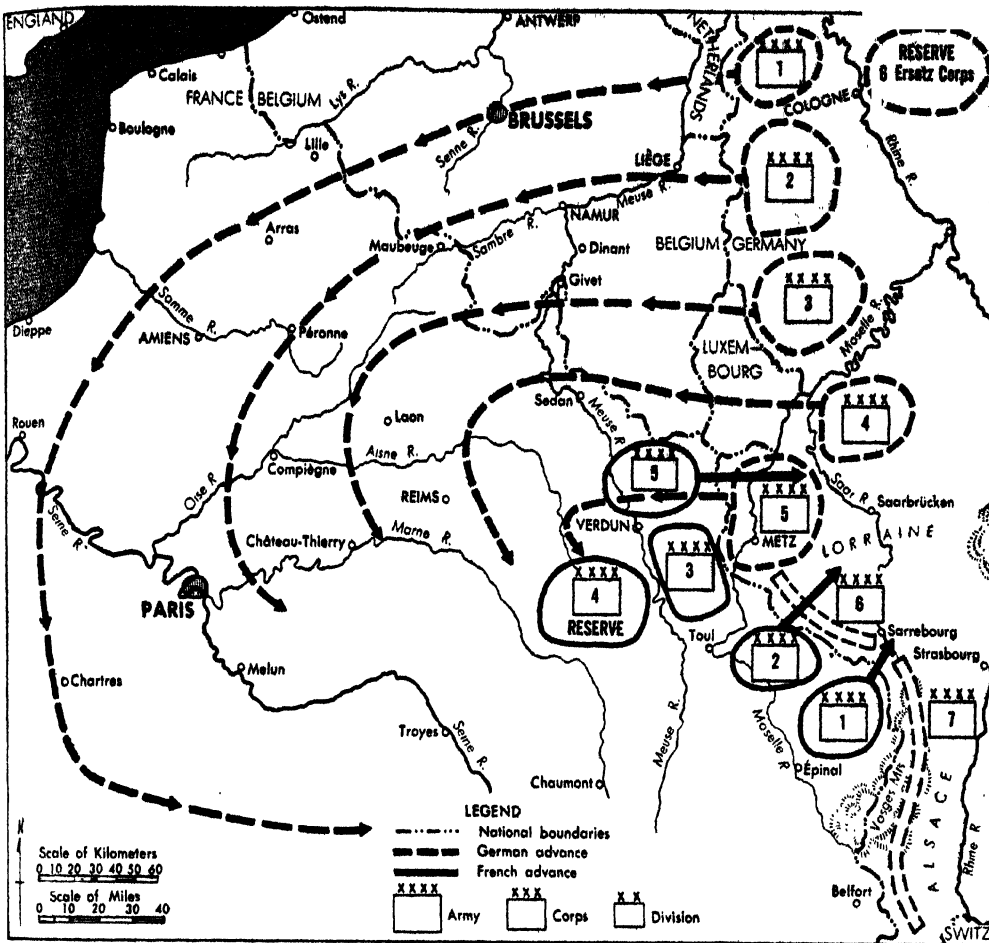

statistics of the purely combat aircraft produced. As an indication of the comparative air strengths of the belligerents in combat aircraft, those with the armies at the time of the armistice were as follows: French, 3,321; German, 2,730; British, 1,758; Italian, 812; American, 740; Austrian, 622; and Belgian, 153. The planes with the American forces were preponderantly British and French. When the United States entered the war, the Americans were urged by the French and British to concentrate on the production of engines and bomber planes, for designs of fighter planes were changing too rapidly to initiate production of any one type. The 12-cylinder Liberty engine was accordingly designed and adapted for mass production. A superb engine, it was in great demand by the Allies, and more than 30,000 units were built during the war. The Liberty engine was the greatest single contribution of the United States to World War I aviation.

See also section 14. *The War in the Air; AERONAUTICS—1. History (World War I).*

Naval Power.—In 1914, Great Britain was the greatest naval power in the world, and Germany was second. The total completed tonnage of the British Navy was 2,157,850; that of the German Navy, 951,713 (if tonnage under construction is included, the figures rise to 2,714,106 tons and 1,306,577 tons, respectively). When these figures are increased by the large navies of the other Allied powers and by the meager holdings of the German allies, it is evident that the Central Powers were hopelessly outclassed on the high seas. The relative strength in various types of warships of the British and German navies, respectively, was as follows: modern dreadnoughts and pre-dreadnoughts, 40 and 33; battle cruisers and cruisers, 116 and 54; destroyers, 218 and 142; and submarines, 55 and 28. At the outbreak of the war the preponderance of the German High Seas Fleet was in home waters, where it was quickly bottled up by the superior British Grand Fleet. The 10 German cruisers on the high seas when war broke out were rounded up and destroyed, but not before they had sunk 5 British warships and 50 Allied merchantmen. The only hope of the Germans was to catch inferior portions of the British Fleet alone and thus to whittle down the disparity in naval strength. A sortie to this end was made in 1916, bringing on the Battle of Jutland, which resulted in a moral but unproductive victory for the Germans. No further major sorties were attempted.

The Central Powers were also greatly inferior in commercial shipping. In 1914 the commercial oceangoing steamships owned by the various nations had the following aggregate gross tonnages: Great Britain, 20,100,000; United States, 2,027,000; other Allies, 7,675,000; Central Powers, 6,325,000; and neutral nations, 6,640,000. Moreover, whereas Allied commercial shipping was free to roam the oceans, that of the Central Powers was restricted by the Allied blockade to inland waters under their control.

The submarine had been designed as an offensive weapon against major warships, and early in the war it was so considered even by the Germans. When it became evident that their navy was to be bottled up indefinitely by the British, however, the Germans turned to the use of the submarine for the destruction of merchant shipping. This was their last resort in an attempt to reduce the Allied advantage in shipping and thus to weaken the support of Allied land operations.

SCHLIEFFEN PLAN AND FRENCH PLAN XVII. The German Schlieffen Plan aimed to gain surprise by violating Belgian and Dutch neutrality; then, driving swiftly to get behind the French armies, the German right-wing armies would pin them against the Vosges Mountains. The German reserves were to follow closely and take over rear-area duties, so that the right-wing armies could remain at full strength for the coup de grâce. Count Alfred von Schlieffen's dying words are said to have been "keep the right wing strong." French Plan XVII called for drives on both sides of Metz, to liberate beloved Lorraine. It took cognizance of a possible German advance through Belgium, but it assumed that such an advance could come only east of the Meuse River. In this case, the Fifth Army was to move north of Sedan; its place in line would be taken by the Fourth Army. Note that the farther the French advanced into Lorraine, the more vulnerable the French armies would be to the German scheme.

The initial impact of the German submarine warfare was heavy, but the Allies developed the convoy system and other antisubmarine devices that proved fairly effective. Nevertheless, losses due to German submarine warfare were great, particularly in British shipping. Huge construction programs were inaugurated in British and American shipyards, and these succeeded in replacing most of the shipping destroyed.

5. Western Front: 1914—Invasion and the Marne

WAR PLANS

In the years before the outbreak of war in 1914, both the Germans and the Allies made plans for the struggle toward which the Euro-

pean tensions were leading.

German Plans.—The genesis of the final German plan for the war on the western front was the Schlieffen Plan of 1905, compiled by Count Alfred von Schlieffen, then chief of the General Staff. He was a disciple of Karl von Clausewitz, intent not merely on defeating the enemy but on actually destroying him, and his plan reflected this philosophy. Feeling certain that the French would devote their energies to recapturing Alsace and Lorraine (which they did), he envisioned a wide sweep to get behind them and pin them against the difficult terrain of the Vosges Mountains. To gain maneuver room for his massive encircling armies, he planned to cross the southern Netherlands and Belgium and break into France over her weakly defended frontier between Mézières and Dunkerque, where the French would not expect an attack because of the internationally guaranteed neutrality of Belgium. All possible strength was to be concentrated in the right-wing armies (the First and Second) of the enveloping force; the two armies on the Alsace-Lorraine front (the Sixth and Sev-

enth) would be strategically on the defensive, but they would try to lure the French on by limited attacks, thus keeping them occupied while the encircling armies closed in on their rear. At the appropriate time, the Sixth and Seventh armies would take the offensive and close the trap on the French. To maintain the full strength of the right-wing armies, special ersatz (substitute) corps were to be organized to take over rear-area duties as the advance progressed. The campaign was to be a lightning one of only a few weeks' duration; therefore, only small forces were to be left to confront the weak Russians. Ample time to deal them a death blow would be available after the conquest of France.

Schlieffen retired at the end of 1905 and was succeeded by Col. Gen. Helmuth von Moltke. Initially, Moltke retained the Schlieffen Plan, but he was soon confronted by a changing international balance of power. Russia had recovered rapidly from her defeat by the Japanese in 1905 and had expanded and improved her armed forces. Germany's ally under the Triple Alliance, Italy, whom Schlieffen expected to provide troops for his left wing, showed signs of faltering. The Saar coal mines and the Rhineland industrial area became essential to the German railroads and armament industry, and their protection had to be assured. These altered factors led Schlieffen himself to recommend in 1912 that the German Army be greatly strengthened for a simultaneous attack along the front from Belfort to the sea.

Moltke attempted to modify the Schlieffen Plan to meet the new conditions. First he decided not to violate Dutch neutrality—a laudable decision for political, ethical, and economic reasons. From a military point of view, however, this decision required the Germans to crowd their two large northern armies through the fortified bottleneck of Liège. Moltke made provision for greater forces to face the Russians and to protect the Saar and the Rhineland against the French. The net result of his modifications was that by 1914 the ratio of seven to one in favor of the right-wing armies, envisioned in the Schlieffen Plan, had been reduced to slightly less than four to one. While fault can be found with some of Moltke's changes in the original Schlieffen Plan, it was in his fumbling execution of the plan that he departed most sharply from its basic spirit, which was exemplified in Schlieffen's reported dying words, "Make the right wing strong."

Allied Plans.—The Allies had no precise plan to counter an invasion by the Germans. Belgium took her neutrality seriously and would not engage in war planning with her friendly neighbors. The British had worked in close collaboration with the French since 1911, and had agreed to send a British expeditionary force to the Continent to operate on the left of the French armies.

Since shortly after the Franco-Prussian War of 1870–1871, the French had been making and revising war plans to conform to changing circumstances. Plan XVI, in effect in 1911, provided for an offensive into Alsace-Lorraine to recover the lost provinces. Gen. Augustin Edouard Michel, then vice president of the Conseil Supérieur de la Guerre, considered the plan dangerous in that he believed that the Germans would advance through Belgium rather than through the difficult terrain on the Alsace-Lorraine front. He proposed a concentration on the Belgian border, between Lille and Rethel, ready

to undertake a vigorous offensive to drive the Germans from Belgium when they came that way. Such a plan involved the reorganization of the French Army and the possibility of unintentional violation of Belgian neutrality, however, and primarily for these reasons Michel's plan was rejected. He was replaced by Gen. (later Marshal) Joseph Joffre.

Despite certain personal eccentricities, Joffre was a man of strong personality and great firmness of character. These traits enabled him to gain the confidence of four successive war ministers to the extent that his control of the army became almost absolute. Under his leadership, Plan XVII, the plan in effect when war came, was prepared. Unlike the Schlieffen Plan, it was not a complete pattern of operations. It specified only the organization and concentration areas of the French armies and the intention to attack immediately. The First, Second, Third, and Fifth armies, in order from right to left, formed the first line. The Fourth Army was to the rear of the Third Army, ready to move to the latter's left if the Germans invaded Belgium (in which case the Fifth would move north to meet them), or to the right of the Third if the enemy moved through Switzerland. The Cavalry Corps was to be concentrated to the left front of the Fifth Army, ready to move into Belgium if the Germans came that way. The British Army, though not included officially in the plan, was to assemble on the left of the Fifth Army, around Le Cateau, if Britain entered the war. Once the concentration was completed, two major attacks would be launched: one generally south of the Metz fortified area, and the other north of it. No further details were given as to the attacks, since Joffre preferred to allow for changes in the situation.

It is evident that the French intended to do just what the Germans thought they would, and so make themselves vulnerable to the trap of the wide German envelopment through Belgium and western France. The majority of the French High Command recognized that the Germans might violate Belgian neutrality, but they believed that German strength would not permit operations west of the Meuse River without dangerous overextension. This conclusion was based on an accurate knowledge of the strength of the German Army, but its fallacy lay in an ignorance of the fact that the German Reserve units had been so highly trained that they could operate in the first line immediately after the outbreak of war. In sum, under existing circumstances Plan XVII was unsound. Michel's plan would have placed the French armies squarely in the path of the German wheel, thus avoiding the serious situation in which Joffre's armies found themselves in early September 1914.

THE OPPOSING ARMIES

French Army.—France, with a smaller population than that of Germany, had less available manpower. In consequence, whereas the Germans took into military service 50 percent of the men reaching the age of 20 each year, the French took about 80 percent. The German period of Reserve service was 5.5 years; the French period, 14 years. The French Territorial Army included men from 37 to 48 years of age; the maximum age of the men in the corresponding German Landwehr was 39. As a result, the Germans had the advantages of youth and of a

greater range of selection. The French Army had made tremendous strides since 1871, and by 1914 it was second only to the highly developed and precisely trained German Army. The French officer corps was generally devoted and highly capable, although it had become something of a political football. The Boulanger conspiracy, the Dreyfus case, and the anticlerical crusades all had affected the army, particularly the morale of the professional officers. Excessive civilian control had impelled some of them to seek promotion through political manipulation. Despite these unwholesome factors and an exceedingly low pay scale, most of the officer corps had remained true to its ideals. Years of hard work in schools, at headquarters, and with troops had developed excellent leaders and staff officers. Many of the French officers had had combat experience in colonial wars.

In tactical training the French Army lagged behind the German Army. Imbued with the philosophy of the attack ("*l'offensive à outrance*") as preached by Gen. (later Marshal) Ferdinand Foch, it had sadly neglected the teaching of defensive tactics. Consequently, the French were not highly skilled in field fortification, organization of the ground, and use of the machine gun and wire entanglements in the defense—areas in which German troops had received concentrated training. This do-or-die offensive spirit was to cause the decimation of the French officer corps.

In the category of artillery the French had the best weapon in the world in their 75-mm. field guns. Unfortunately, they had become so confident of this weapon that they had neglected medium and heavy artillery. When the fighting began, they had only about 300 guns larger than the 75-mm. gun, whereas the Germans had about 3,500. This discrepancy proved a serious handicap from the very first action and an even greater one when trench warfare began.

In round numbers the French armies employed in the opening campaign totaled 1,650,000 men. The fighting quality and, more especially, the recuperative power of the French soldiers were to prove an unpleasant surprise to the Germans, who had held them in low regard.

German Army.—At the outbreak of war the German Army was superior to other armies in organization, staff work, discipline, training, and equipment. It owed its superiority to a military tradition handed down from the days of Frederick the Great, and to the unstinted pride and support of Emperor William II and the German people as a whole. The efficiency of the army was due principally to the conscientious, hard-working cadre of Regular officers and noncommissioned officers. These men, carefully selected and trained and inculcated with a tradition of thoroughness, had so developed the young men of the country that after their two years of active service they maintained a very high standard in the Reserves. Reserve units were therefore able to take their place alongside Regular units at the outbreak of the war, to the surprise and chagrin of the French High Command. In addition to active, Reserve, and Landwehr units, the Germans formed a type called *ersatz* units, composed of men not suitable for the other units and designed to take over duties in the rear and on quiet fronts, thus releasing the better troops for more active employment. In round numbers the eight German field armies (including the one in East Prussia) that participated in the opening

campaigns totaled 2,000,000 men.

In tactical training the Germans believed initially, as others did, that weapons of the day gave the advantage to the attacker. They did, however, heed the lessons of the Russo-Japanese War and trained their infantry intensively in defensive measures; this was to be of inestimable value when the front became stabilized. The German Army of the day was the best-equipped army. It had specialized in medium and heavy artillery, which other armies had neglected, and had developed a mobile siege train, consisting largely of 42-cm. howitzers, that proved its worth in the opening engagement of the western front by battering down the formidable defenses of Liège.

British Army.—The British Army in 1914 stood in sharp contrast to the Continental armies. The traditional military policy of Britain had been to have the strongest navy in the world and an army just large enough to police the colonial empire and protect the British Isles from invasion. British troops were all volunteers, Regular Army soldiers whose term of service was 7 years. They were highly trained and disciplined, were commanded by well-qualified professional soldiers, and had an *esprit de corps* superior to that of any Continental troops. Backing this regular force were home guards to defend Britain against invasion during the absence of the Regular Army, but they were too poorly trained and equipped to have combat value at the beginning of the war. The outbreak of war found Britain with only six infantry and one cavalry Regular Army divisions at home, ready for war, and five divisions overseas.

Belgian Army.—The Belgian Army, small and not highly trained or well equipped, was organized into one cavalry and six infantry divisions. Initially, it comprised 115,000 men in the field forces and 70,000 in garrisons. By the end of the war its numbers had increased to 267,000. It could not stem the German horde by itself, but it hoped to delay the German advance until the French and British came to its aid.

GERMAN INVASION OF BELGIUM

Moltke's decision to respect the neutrality of the Netherlands made it necessary for his huge First and Second armies, the hammer head of his wheeling movement, to pass through the narrow

defile at Liège. Restricted on the north by the Dutch border and on the south by the rugged Forest of Ardennes, this defile was only a few miles wide. The valley of the Meuse and the formidable fortifications of Liège had to be overcome before the German armies could debouch into the open ground beyond.

King Albert I's plan was to assemble his entire field army along the Meuse between Liège and Namur and to hold the Germans along the river line as long as possible. His advisers, however, persuaded him not to risk the entire mobile army to annihilation at one stroke, but to assemble it behind the Gette River, a small stream about 30 miles northwest of Liège. There it could await the British and French and complete its preparations while the forts of Liège and Namur delayed the Germans.

Liège was considered one of the strongest fortresses in Europe. The city proper was protected by 12 forts, arranged in a ring 10 miles in diameter and dominating the terrain with their guns. Its position was very strong, but its garrison of 40,000 men was not large enough to defend adequately the intervals between the forts. The necessity for reducing Liège quickly had long been recognized, and the Germans had

made thorough preparations for the task. Selected units of the First and Second armies at full strength had been posted on the Belgian border for several years, and very heavy artillery to reduce the forts had been manufactured. The German plan was for these picked units, covered by artillery fire, to penetrate the intervals between the forts at several points, capture the city and the Meuse bridges there, and reduce the isolated forts one by one. Meanwhile, cavalry was to cross the river north of the city and attack the forts on the west side.

On the morning of August 4, the Germans assigned to reduce the fortifications crossed the frontier. The next morning, after the Belgian commander at Liège had rejected a summons to surrender, they began their attack. In attempting to penetrate between the forts, they found Belgian infantry hastily entrenched in their path. These troops fought bravely and, despite heavy losses, held the attackers to negligible gains. Meanwhile, the German cavalry succeeded in crossing the Meuse north of Liège. Realizing that the city would inevitably be encircled by overwhelming forces, the Belgian commander at Liège, Gen. Gérard Mathieu Leman, wisely decided to send the mobile division that King Albert had left with him to join the main army on the Gette, and to fight it out to a finish with his fortress troops. The city proper fell to the Germans on August 7, but the forts continued to hold out. On August 12, the attackers belatedly brought up their heavy siege artillery. Their 42-cm. howitzers, the heaviest artillery used up to that time, were too formidable for the forts, which had been built to withstand only 21-cm. fire. One by one they fell; the last two, on August 16. The westward march of the German First and Second armies began at once. Since the attack on Liège was made some time before German mobilization was complete and the armies were ready to move, Leman's admirable defense had not delayed the German advance for the full period August 5-16; actually, a delay of two or three days was effected.

The German First and Second armies then devoted their attention to the mobile Belgian Army under King Albert, but the latter proved elusive. By August 20, after skillful withdrawals, the Belgian Army, except for one division at Namur, was within the fortifications of Antwerp. On that day, the German First Army entered Brussels. At Antwerp the Belgians held a flanking position that the Germans were forced to mask with one corps, thus depleting the strength of the First Army.

BATTLE OF THE FRONTIERS

Offensive in Lorraine.—While the French completed their mobilization and concentration under Plan XVII, a corps of the French First Army invaded Alsace and captured Mulhouse on August 7-8. The jubilation of the inhabitants was short lived, for a counterattack by the Germans on August 9 drove the French back to their starting point. This minor defeat caused Joffre to modify his order of battle. The Mulhouse operation had been undertaken by Gen. Auguste Y. E. Dubail, First Army commander, who had not been able to direct it properly because of its distance from his headquarters. Foreseeing more such trouble, Joffre formed a new command, the Army of Alsace, of three corps, commanded by Gen. Paul M. C. G. Pau, who was called from

retirement. Its mission was to advance on the right of the First Army and to cover its flank.

Plan XVII was a general plan setting forth army concentration areas and declaring the intention to attack. On August 8, Joffre supplied details of the operations to come in his General Instructions No. 1. The First and Second armies were to launch an offensive northeastward into Alsace-Lorraine. Dubail's First Army, with its right protected by the Army of Alsace, was to capture Sarrebourg and drive the enemy toward Strasbourg. Gen. Edouard de Curières de Castelnau's Second Army was to attack on Dubail's left. Opposing the French offensive were the German Sixth Army (Col. Gen. Josias von Heeringen) and Seventh Army (Crown Prince Rupert of Bavaria), both armies being nominally under the command of the crown prince. The latter, who was not a trained soldier, had been provided with a brilliant and forceful chief of staff, Gen. Konrad Krafft von Dellmensingen, who was the commander except in name.

It will be remembered that Schlieffen's original plan called for a fighting withdrawal of the two German left-wing armies. Moltke had modified the plan to provide enough strength for aggressive action. The Sixth and Seventh armies were to fall back fighting to the general line Morhange-Sarrebourg-Vosges Mountains, and when the French had committed themselves against this line, the German armies were to make a converging counterattack to drive the French armies back. The battle went almost exactly as the Germans had planned.

On August 14, the French offensive began. For four days the Germans fell back slowly, delaying with rear guards and artillery fire and inflicting heavy casualties. As the planned final line of resistance was neared, the German defense stiffened. Joffre, Castelnau, and Dubail all recognized the signs of the impending counter-offensive, but they were confident of breaking it up when it came. On August 20, the German blow fell, and in very heavy fighting the French were pushed back all along the line. The First Army fell back in comparatively good order, but two corps of the Second Army were nearly routed, and only the firm stand of General Foch's 20th Corps, the so-called Iron Corps, averted a disaster. For the next five days, the French were able to withdraw and establish themselves along the fortified heights of Nancy and behind the Meurthe River without serious German opposition.

Elated over the victory and believing the French armies to be so badly beaten that a vigorous drive would destroy them, Krafft von Dellmensingen pressed Moltke for permission to continue the offensive. Moltke agreed. In doing so, he was effecting a major change in the Schlieffen Plan, for he was trying to make a double envelopment instead of staking everything on a strong right wing. Under this new conception the German Sixth and Seventh armies were to dash themselves against the fortified heights of Nancy, the very region that Schlieffen had warned against as being unsuitable for major offensive action. Because it led Moltke into a false strategy, it may be said that the French defeat in Lorraine actually proved to be an advantage to France, for it tied down German troops and kept Moltke from sending them to his right wing, where they might have exerted a decisive influence.

Battle of the Ardennes.—According to Joffre's

General Instructions No. 1, while his First and Second armies attacked in Lorraine, the other French armies—the Third, Fourth, and Fifth—were to advance to the north through the Ardennes. This plan was based on Joffre's assumption that the Germans, lacking sufficient troops, would not advance to the east of the Meuse. But Gen. Charles L. M. Lanrezac, the Fifth Army commander, was convinced that this assumption was false and kept pressing Joffre for permission to move his entire army west of the Meuse and north into Belgium to meet the German enveloping force. When, on August 15, the Germans made a strong attack on Dinant, attempting to seize the bridges there, Joffre came around to Lanrezac's view and ordered him to move north into the angle formed by the Sambre and Meuse rivers. The Fourth Army then moved upon the left of the Third Army, approximately where the Fifth had been. This change of plan reduced Joffre's forces for the attack in the Ardennes from three armies to two, the Third and Fourth. To protect the right flank of the Third Army from any German attack from the fortified zone of Metz, Joffre formed the new Army of Lorraine, composed entirely of Reserve divisions and commanded by Gen. Joseph Maunoury.

The German Fourth and Fifth armies, forming the pivot of the great German wheel, had been moving forward slowly, regulating their advance on the speed of the hammer head, the First and Second armies. Their zones of advance were such as to bring them into collision with the French Third and Fourth armies. The clash occurred on August 22, two days after the great battle in Lorraine. The fighting took place along the narrow forest roads, where observation and liaison were difficult. The French pushed their attacks with persistence and vigor, suffering enormous losses. Finally, after three days of bloody fighting, they fell back. By August 25, the Fourth Army was retiring to the west side of the Meuse, and the Third was back approximately on its starting line, with its right flank in contact with the fortress of Verdun. On the following day, the Army of Lorraine was dissolved, two divisions being sent to the west to form the nucleus of the new Sixth Army at Amiens. German general headquarters received reports of a smashing victory, the impression being given that the French Third and Fourth armies had been almost eliminated. As a matter of fact, they had been beaten and had taken frightful losses, but they were able and ready to fight again.

Battle of the Sambre.—In accordance with Joffre's order of August 15, the French Fifth Army moved into the angle of the Sambre and Meuse by August 20. Meanwhile, some confusion arose as to its exact mission. On August 18, Lanrezac was advised that if the German right wing crossed in force to the west of the Meuse, his Fifth Army was to move northward to envelop it; if the enemy kept his main body east of the Meuse, the Fifth Army was to attack eastward across the river. In other words, Lanrezac was to be prepared to attack to the north across the Sambre or to the east across the Meuse, depending on where the German main forces were. Unaware of the location of the enemy, Lanrezac was perplexed. He did nothing until about noon of August 21, when he applied to Joffre for instructions. Joffre replied, "I leave it entirely to you to judge the opportune moment for starting

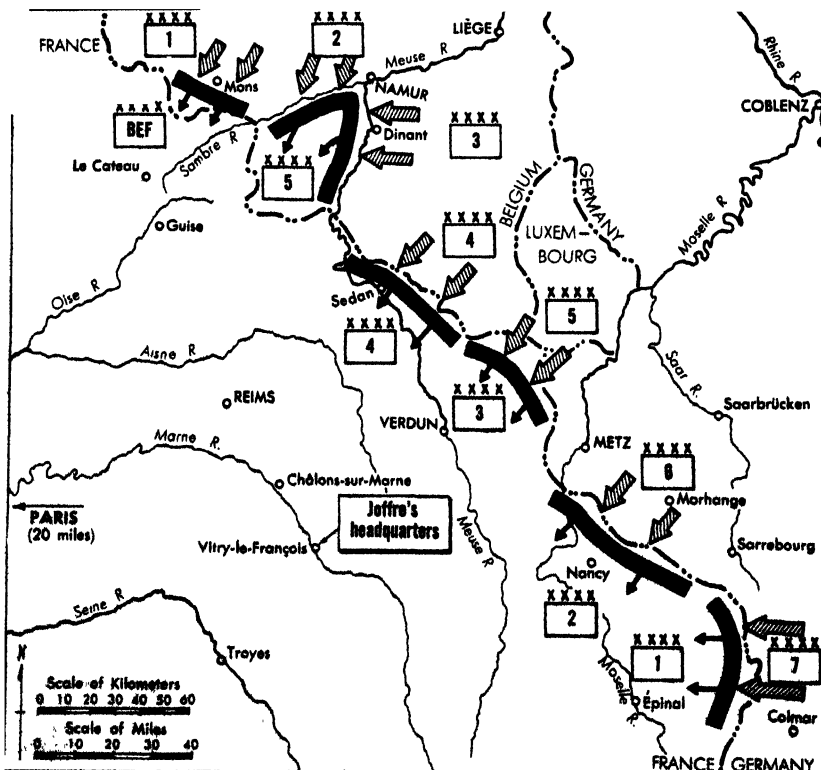

your offensive movement." Meanwhile, Lanrezac's troops were guarding the Sambre bridges, but in the absence of orders they did not cross to the north to establish bridgeheads.

At this time, Gen. (later Field Marshal) Karl von Bülow's Second Army was starting its wheel to the south and was headed squarely for Lanrezac's Fifth Army. The German Third Army, commanded by Col. Gen. Baron Max von Hausen, was approaching from the east. On the afternoon of August 21, advance units of the Second Army reached the Sambre and, finding the crossings weakly guarded, attacked. A bloody, disconnected battle, lasting all afternoon and into the night, ensued in the thickly built-up Sambre Valley. The Germans were held at some points but succeeded at others; in the end, they gained a foothold south of the river. That night, Lanrezac's corps commanders informed him that they intended to counterattack the following day and drive the enemy back across the Sambre. Lanrezac made no comment, and the attack proceeded. On the German side, Bülow directed his troops to hold their positions on August 22 and await the arrival of Hausen's Third Army on Lanrezac's right. The French attacks on that day were thrown back with heavy losses. Bülow then judged that he had enough strength to defeat the French Fifth Army without waiting for Hausen. His attack southward drove the French center and right back several kilometers by nightfall. Lanrezac then decided to attack northward on August 23 to envelop Bülow's left flank. For this purpose, he ordered his 1st Corps, which had been guarding the Meuse crossings, to move northward, leaving the crossings to be guarded by a Reserve division. Just as the 1st Corps was about to attack, its commander, Gen. Louis

Franchet d'Esperey, learned that the German Third Army had forced a crossing of the Meuse to the south. Since such a move would put it in the rear of the French Fifth Army, Franchet d'Esperey, without waiting for orders, called off his planned attack and sent advance units speedily southward to head off the Germans. They arrived in time, drove back the advance elements of the German Third Army, and temporarily stabilized the situation. That day, the Belgian division in Namur, foreseeing the fall of the city, moved out and took refuge behind the French Fifth Army.

Lanrezac correctly concluded that his army was in a serious plight and decided to withdraw—a decision which Joffre promptly approved. Bülow, believing that he was preparing a *coup de grâce*, ordered Gen. Alexander von Kluck (whose First Army had been subordinated to Bülow) to turn against Lanrezac's left, and requested Hausen to attack with his Third Army directly westward. Kluck did not receive the order in time, but Hausen attacked to the west as Bülow had requested. When the German blow fell on August 24, it fell on thin air, for Lanrezac had withdrawn his troops the night before. This Battle of the Sambre is sometimes called the Battle of Charleroi or Battle of Namur. It was a German victory, but the French Fifth Army, like the other technically defeated French armies, was by no means destroyed or neutralized.

The lack of decisive results for the Germans was due largely to a faulty command structure. Moltke tried to achieve coordination by subordinating the First Army to the commander of the Second Army, as he had done with the Sixth and Seventh armies in the east. This was inherently incorrect, for Bülow, concerned primarily with

BATTLE OF THE FRONTIERS (Aug. 14-24, 1914). This was the initial meeting of the main Allied and German armies on the western front. It consisted of four separate engagements: The British Expeditionary Force (BEF), rushing to the aid of the Belgians, met and was forced back by the more powerful German First Army in the Battle of Mons. Similarly, the French Fifth Army was driven back by the German Second and Third armies in the Battle of the Sambre. In the center the French Third and Fourth armies were repulsed by the German Fourth and Fifth armies in the Battle of the Ardennes. To the south the advance of the French First and Second armies in the offensive in Lorraine gained initial successes, capturing Sarrebourg and threatening Morhange, but counterattacks by the German Sixth and Seventh armies forced the French back across the border.

the operations of his own army, bent the efforts of the other armies toward its success and failed to see the picture as a whole. Hausen was not under his command, but since Bülow was a member of an ancient noble family of Prussia, the former deferred to his wishes without question. So far only the Russians had solved the problem of coordinating the efforts of armies by the establishment of army group headquarters.

Battle of Mons.—On August 20, Moltke's headquarters advised Bülow that the British would eventually appear in the vicinity of Lille but that "no important debarkations have thus far taken place." Actually, the British had nearly completed their concentration in the Le Cateau area and were about to begin their advance into Belgium. Based on this erroneous information, Bülow ordered Kluck's First Army to change its direction of march from southwest to south in order to assure that his own Second Army would be supported in the coming Battle of the Sambre against Lanrezac's Fifth Army. Unfortunately for the Germans, this action was unwise, for Kluck's First Army struck the British Expeditionary Force (BEF) head on at Mons, whereas if it had continued on its southwesterly course, it would have enveloped its left flank, thereby altering the course of the entire campaign.

Field Marshal Sir John French (later 1st earl of Ypres), commander of the BEF, had moved with unprecedented efficiency. He had been instructed that, although he was not actually under Allied control, he was to cooperate with the French armies and base his strategy on theirs. On his way to Le Cateau, he visited Joffre and Lanrezac. The latter's manner irritated the British commander, generating an unfortunate relationship that was to lead to friction and lack of coordination.

On the night of August 22, the BEF took up a position at Mons. A gap of several kilometers between the British right flank and the left flank of the French Fifth Army was covered by a British cavalry brigade and by Gen. C. C. Sordet's exhausted French Cavalry Corps. British reconnaissance planes had reported heavy columns of German troops moving toward Mons that day, and when Lanrezac suggested that the British wheel to the right and strike the flank of the German Second Army, Field Marshal French declined to do so. It was well that he refused, because such a move would have presented the British left flank to Kluck's advancing First Army.

On the morning of August 23, Kluck's advance guards struck the British position at Mons. The ensuing Battle of Mons was a series of determined German attacks running into an equally determined British defense. The British Regular Army troops, though greatly outnumbered, stood their ground and gave the Germans a sharp lesson in expert marksmanship. Attacking in close formations, the Germans suffered severely from the British fire. By the end of the day, the British had been pushed back as much as five kilometers in some places but had held their ground in others. At nightfall they began to entrench their positions, intending to fight again on the next day, August 24. That night, however, French learned of Lanrezac's withdrawal and, believing it futile to stand alone, ordered a retreat that began before daybreak on August 24.

Results of the Battles.—These four actions—in Lorraine, in the Ardennes, on the Sambre, and at Mons—are collectively called the Battle

Militärgeschichtliches Forschungsamt

One of the 12 forts guarding the Belgian city of Liège, destroyed by 42-cm. German howitzers in August 1914.

of the Frontiers. The major fighting lasted only four days (August 20–23, inclusive), but French casualties exceeded 300,000, with appalling losses among the young offensive-minded officers.

Despite their heavy losses and reverses, the French soldiers maintained a surprisingly high morale. Among the general officers and higher staffs, however, the complete collapse of the French offensive plan had a demoralizing effect. But Joffre himself and his operations officer, Maj. Gen. (later Gen.) Henri M. Berthelot, maintained complete calm and confidence in ultimate victory. Now that they understood the German plan, the two generals set about to counteract it. Obviously, the BEF and the French Fifth Army were not strong enough to stop the German right wing by themselves and must therefore be reinforced. This could be accomplished by withdrawing elements from the right-wing armies, which were defending on good terrain and could spare the troops. These elements would be used to form a new army on the French left. On August 25, Joffre issued his General Instructions No. 2. The new army (the Sixth) was to assemble in the Amiens area; the BEF and the French Third, Fourth, and Fifth armies were to withdraw to the general line Somme River-Verdun, and be prepared to counterattack when they reached that line. This general plan eventually resulted in a successful counterstroke, though from a position much farther south of the Somme.

While Joffre realistically appraised the new situation and planned appropriate countermeasures, Moltke, elated by exaggerated reports of German successes, cherished the illusion that he had practically won the war. At this time, the Russians had invaded East Prussia with two armies, and the news from that front was not good. Moltke felt free to detach a corps from each of the Second and Third armies to send to East Prussia. The First Army had already been compelled to detach a corps to contain the Belgian Army in Antwerp, the Second had had to leave a corps to besiege the fortress of Maubeuge, and the Third had had to leave a division to besiege the little fort of Charlemont at Givet. Schlieffen had anticipated the necessity

for such detachments, and had provided for ersatz corps to follow and take over front-line duties so that the main attack could retain its full strength. Moltke had kept the ersatz corps in Germany and eventually assigned them to the armies on the Alsace-Lorraine front. By August 26, therefore, the three right-wing armies on which a decision depended and which had entered Belgium with 16 corps, had only 11 corps. On August 27, Moltke ordered a continuation of the general advance: the First Army to march west of Paris; the Second Army, directly on Paris; and the Third, Fourth, and Fifth armies, east of that city. The left-wing armies (the Sixth and Seventh), instead of remaining on the defensive and serving as a reinforcement pool for the right wing, were to continue the attack against the line of the Moselle River, break through, and form the eastern arm of a double envelopment.

BATTLES OF LE CATEAU AND GUISE

The resistance of Lanrezac's Fifth Army had stunned Bülow and caused him to hesitate, so that the Fifth Army had little difficulty in retreating. The British, however, were hard pressed by the iron-willed Kluck, who drove his First Army forward relentlessly. As a result, British troops were engaged daily in rear-guard actions.

Battle of Le Cateau.—Kluck was under the impression that the British were based on the Channel ports of Boulogne and Calais and kept trying to envelop their west flank to cut them off from their bases. Consequently, the left of the British line (the 2d Corps, under Gen. Sir Horace Lockwood Smith-Dorrien) was constantly under greater pressure than the right (the 1st Corps, under Gen. Sir Douglas Haig, later 1st Earl Haig). When the 2d Corps reached its assigned

position at Le Cateau, the Germans were in close contact at many points, and the British troops were exhausted by three days of marching and fighting. Haig's 1st Corps had not been as heavily engaged at Mons as the 2d Corps and had been under relatively light pressure thereafter. It therefore occupied its prescribed position at Le Cateau on the right of the 2d Corps without difficulty.

Smith-Dorrien felt that his troops were too nearly exhausted to continue the withdrawal, and decided to stand his ground on August 26 and retreat under cover of darkness on the following night. This decision brought on the biggest battle that the British Army had fought since Waterloo.

Advance elements of Kluck's First Army, believing that they were still pursuing the fleeing British, struck the British 2d Corps position early on August 26. Meanwhile, Haig had continued the retreat, so that Smith-Dorrien's right flank was completely open and his 2d Corps had to face east as well as north. The 2d Corps held its ground well in the center, but the right flank gave way and withdrew early in the afternoon, under heavy fire and with great loss. Soon the left flank was enveloped, and the 2d Corps was threatened with disaster if it did not withdraw immediately. At this moment, Sordet's Cavalry Corps came up from the southwest, diverting the attention of the Germans and allowing the British 2d Corps to withdraw. This corps had engaged German forces of more than twice its strength and is credited with having conducted a successful delaying action. The price was high, for it suffered casualties of 20 percent.

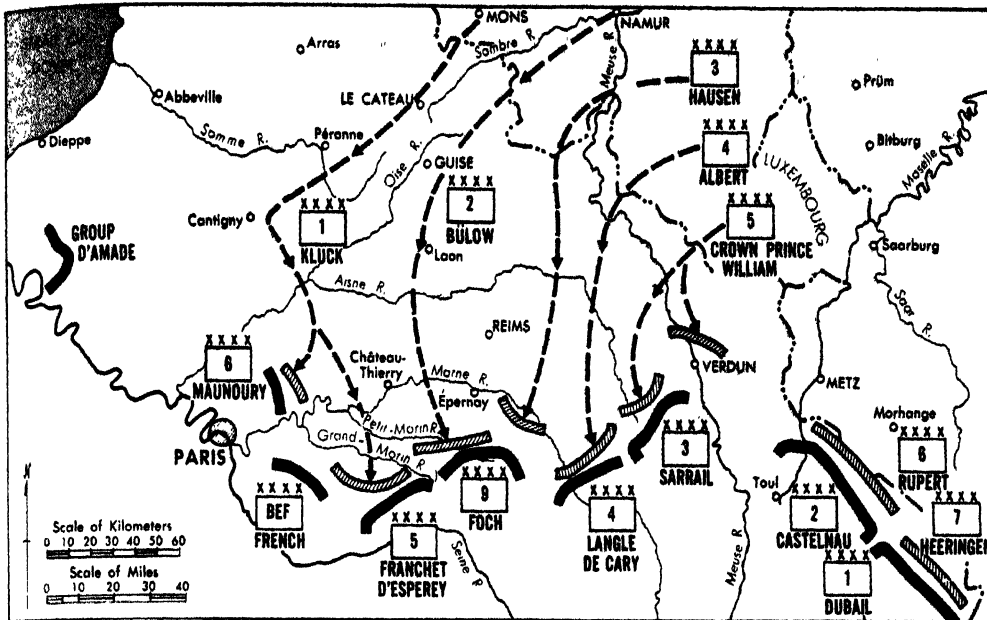

Battle of Guise.—During the fighting at Le Cateau, Joffre conferred with Marshal French and Generals Lanrezac and Albert d'Amade (commander of a group of French Territorial and Reserve divisions operating west of the British). Their reports were pessimistic and caused Joffre to doubt that the Allied forces could be organized along the line of the Somme for his counterstroke, as prescribed in his General Instructions No. 2. It began to appear that the retreat would have to continue, and that the counterattack would necessarily take place much farther south. On his return to headquarters he received a highly exaggerated report that the BEF had "lost all cohesion" and needed "serious protection." To take the pressure off the British, he ordered the French Fifth Army to attack westward and strike in flank the German elements attacking them.

Lanrezac received these orders with dismay. His Fifth Army was facing north to hold off Bülow's advancing German Second Army. In order to comply with Joffre's order, he would have to disengage his forces and face them to the west, thereby exposing his own flank to Bülow. Nonetheless, he disposed his forces to accomplish his new mission: two corps were ordered to face west, one to hold the original army front facing north, and the fourth to remain in reserve, ready to move either to the north or to the west as developments necessitated. Lanrezac asked French to cooperate in the operation by having the British 1st Corps make a limited advance northward, but the latter bluntly refused. In French's view, the operation was designed to gain a respite for the British, and he should take advantage of it. His refusal naturally made relations with Lanrezac even more strained than before. On August 29, Bülow's army arrived and attacked from the

British and Belgian troops retreat into France after the hard-fought Battle of Mons (Aug. 23-24, 1914).

GERMAN ADVANCE TO THE MARNE (Aug. 24–Sept. 5, 1914). After the Battle of the Frontiers, the Germans continued their inexorable advance. The BEF was overtaken, and in the Battle of Le Cateau (Aug. 26) part of the force was badly defeated. A counterattack in the Battle of Guise by the French Fifth Army caused the German Second Army to halt for 36 hours and the German First Army to change direction to come to its aid. Meanwhile, Gen. Joseph Joffre worked feverishly to regroup his forces for a stand and counterattack, and began shifting troops to the Paris area. The change of direction of the German First Army took it east of Paris, where the French Sixth Army was forming for counterattack. Gen. Alexander von Kluck, German First Army commander, left a small detachment near Paris and continued to the Marne River. By Sept. 5, the opposing forces were located as shown on the map.

north. Lanrezac's attack to the west was unsuccessful, for the northernmost of the two corps making the attack was struck on its north flank and its westward movement was halted. The commander of the other corps, finding himself unsupported on his right, advanced timidly and failed to push his attack home. Later in the day, he retired behind the Oise River. The heaviest fighting took place to the north, on the original Fifth Army front. Here two German corps attacked with great vigor and drove back the French troops opposing them. Franchet d'Esperey's 1st Corps, then in reserve, was thrown in, and in a general counterattack the Germans were driven north until darkness closed the battle. This was a fine tactical success by the Fifth Army, and French morale was greatly improved by it.

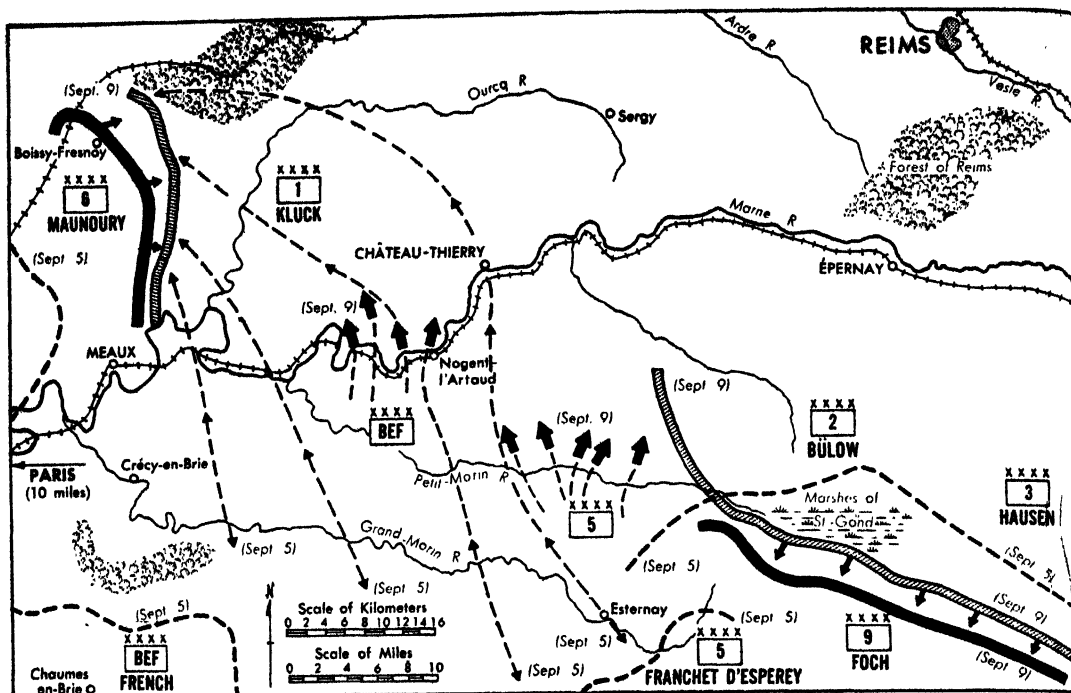

Although the German attack from the north had been halted, Lanrezac's own attack to the west had failed. About half of the German Second Army and all of the First Army lay to the west in a position to envelop Lanrezac's west flank if he remained where he was. He asked Joffre for permission to resume his retrograde movement, which was granted, and he did so on the following day. Lanrezac and his staff had done excellent work in getting the army into position for the battle, but once it was joined, as on the Sambre, army headquarters exercised little control. If the battle is considered from a higher level, Joffre obtained substantially the results he had hoped for, although the fighting did not go as he had planned. Bülow's Second Army was so badly hurt that it stood in place for a day and a half, thus allowing the BEF and the French Fifth Army to continue their retreat without interference. A secondary result was that Kluck's First Army made a drastic change of

direction of advance that was to have far-reaching consequences.

GERMAN ADVANCE TO THE MARNE

After the Battle of Le Cateau on August 26, Kluck continued the march of his First Army to the southwest, in accordance with Moltke's instructions to proceed toward the lower Seine River west of Paris. On August 30, he received a message from Bülow announcing that the French at Guise had been defeated "in a decisive fashion," and requesting Kluck to help exploit the victory by moving southeastward. (A few days previously Kluck's subordination to Bülow had been ended.) Kluck realized that Moltke should be consulted in this instance, but communications were so slow that several days would elapse before he could receive a reply. Meanwhile, the golden opportunity described by Bülow would have passed. Under the circumstances, Kluck decided to do as Bülow wished, but when he learned that, instead of continuing the pursuit on August 31, Bülow's Second Army would remain in place for a day, he became dubious about Bülow's "decisive" victory. Nevertheless, he reasoned that if Bülow was not going to press the advantage over the French Fifth Army, someone else should do so. He therefore pushed on toward the southeast, so as to pass east of Paris.

At his headquarters in Luxembourg, Moltke was almost completely out of touch with his armies. The BEF and the French Fifth Army had been routed, the French Third and Fourth armies were falling back (according to Joffre's plan), and the pursuing Germans met only slight resistance. As a result, Moltke and his army commanders were convinced that the French had been decisively defeated. It apparently occurred

BATTLE OF THE MARNE (Sept. 5-9, 1914). Finally apprised that the French Sixth Army was a major threat to his rear, Kluck ordered his troops to withdraw across the Marne to the French Sixth Army front. A wide gap was thus created between the German First and Second armies, defended only by weak rear guards and cavalry. Into the gap moved the BEF and the French Fifth Army, while Foch's Ninth Army held fast in the Marshes of St.-Gond to the east. With the right of their Second Army forced back and the rear of their First Army threatened, the Germans began a general withdrawal to the line of the Aisne River, 40 miles to the north. The troop dispositions shown on the map are those of Sept. 9, the critical day of the Battle of the Marne.

to none of them that the French withdrawal might be part of a preconceived plan. Spies had apprised Moltke of the arrival of large numbers of troops by rail and of intensive fortification activity in Paris, but he failed to transmit this information to the two field commanders most directly concerned, Kluck and Bülow.

Meanwhile, events caused Joffre to change his strategic plan. The British had been so cut up at Le Cateau that they needed additional time to recuperate. Maunoury's Sixth Army (formed primarily from units transferred from the eastern French armies) was not ready. In addition, Kluck's change of direction had been observed and reported. These changes in the situation induced Joffre to move the limits of the Allied retreat southward to a huge arc extending from Paris to Verdun and curving as far south as Nogent-sur-Seine. His General Instructions No. 4, issued on September 1, outlined this plan but noted that the retreat might not necessarily go so far. It provided also that the Sixth Army assemble for its counterstroke within the entrenched camp of Paris, to be temporarily under the command of the garrison commander.

On August 31 and September 1 and 2, Kluck drove his First Army southeastward as rapidly as possible, intent on fixing and destroying the left flank of the French Fifth Army. Because of his speed and Bülow's 36-hour halt after the Battle of Guise, the German First Army was now a full day's march ahead of the Second Army. Since Kluck was proceeding to the southeast and Bülow to the south, it appeared that Kluck's army could move behind the French Fifth Army while Bülow struck it from in front. The deci-

sive envelopment contemplated by Schlieffen would then become an accomplished fact. On the evening of September 2, as Kluck's 9th Corps reached the Marne River at Chateau-Thierry, he received orders from Moltke to follow the Second Army in echelon and protect the right flank of the German armies.

Moltke's order was motivated by his realization that the French forces at Paris had become formidable, and that sizable forces were needed to hold them off until the German envelopment of the main French armies had been completed. Again, however, he had failed to inform Kluck of the build-up in Paris. Kluck was in a quandary. Since he was already a full day's march ahead of the Second Army, to follow in echelon meant that he must halt for two days. It appeared to him that the supreme command wanted the French driven southeastward, away from Paris. Only his army was in position to do this, for the Second Army was not in close contact with the French, and even if it had been, could only have exerted frontal pressure. Because of poor communications with German general headquarters, Kluck once more made his own decision. This was to continue his attack southward. His 9th Corps had already seized the Marne bridges at Chateau-Thierry and was proceeding to cross the river; Kluck directed two additional corps southward, leaving two corps (later only one corps) north of the Marne to guard against any threat from the direction of Paris. This decision was to produce grievous results for the Germans. Kluck had violated the letter of his orders, but under the circumstances he thought that he was carrying out their spirit.

BATTLE OF THE MARNE

German Change of Plan.—Reports of the shifting of French troops in large numbers from east to west and of great activity in the Paris area finally convinced Moltke that Joffre was preparing a counteroffensive. On September 4, he concluded that the Schlieffen Plan was no longer valid, because his First and Second armies were now too weak to overpower the French in the Paris region, and substituted a new plan. This provided that these two armies would face the eastern front of Paris to hold off the French there while his other five armies sought a decision. The Third Army was to drive directly to the south to rupture the French line, while the Fourth and Fifth armies were to drive southeastward to effect a junction with the Sixth and Seventh armies, which were to push southwestward in the Nancy region. The plan had some merit, but the weakened condition of the armies, occasioned by their rapid movement, and the greatly advanced position of Kluck's army south of the Marne doomed it to failure. Kluck received these orders on September 5. From his advanced position they seemed so illogical that he believed Moltke had been given erroneous information. Again he decided that it was best to push on south of the Marne and overtake the French Fifth Army, thereby adding to the complications of the over-all German situation.

Joffre's Plan for the Counteroffensive.—Joffre had determined the general pattern of his counterstroke as early as August 25, and he resolutely adhered to it despite reverses that made it impossible to launch his offensive as soon or as far north as he had hoped. Now, on September 3, conditions seemed ripe. By thrusting southeastward across the Marne, Kluck had put the German right flank in a perfect position to be struck by the French Sixth Army from the entrenched camp of Paris.

Before Joffre could order his counteroffensive, however, two difficult matters had to be resolved: the British had to be induced to participate in the operations, and the battered French armies had to be rehabilitated to regain their offensive power. The misunderstanding between Field Marshal French and General Lanrezac had caused the former to lose all confidence in the French Army and its leaders. French was con-

vinced that his army needed a period of undisturbed rest and a complete replacement of personnel and equipment losses before it would be fit for serious action. As a matter of fact, the British units, though tired and depleted in strength, had done no major fighting since the Battle of Le Cateau and were certainly in no worse condition than most of the French troops. Impervious to Joffre's appeals, French wired the 1st Earl Kitchener, British secretary of state for war: "I have no definite idea of General Joffre's general plan; its general result is the advance of the Germans and the retreat of the Allies." When Kitchener received this wire and others of a similar tone, he became alarmed and hastened to France on September 1 for an interview with French. There is no record of just what was said, but immediately thereafter French wrote to Joffre, suggesting that the Allies stand and fight, and thenceforth he was consistently in favor of attacking.

The rehabilitation of the French armies proceeded rapidly, for they were now close to their supply bases and replacement centers. From the beginning, Joffre had paid particular attention to the command structure. Disregarding friendship and political factors, he relieved any general officer whom he thought unfit for his job. Between August 2 and September 6, he replaced 3 army commanders, 10 corps commanders, and 38 division commanders. This weeding out naturally made many bitter enemies for Joffre, and very likely injustice was done in some cases, but the general effect of the widespread changes was good. The most controversial case was that of Lanrezac, whom Joffre replaced with Franchet d'Esperey on September 3. Lanrezac had had an outstanding peacetime record, had shown great strategic insight in divining German intentions, and had done excellent tactical planning. Some believe that he was a splendid leader, made a scapegoat to cover the derelictions of the over-all commander, Joffre. Others mark him as a man too small for his responsibilities, indecisive in action, and possessing an overbearing personality that not only bred resentment within his own command but so alienated Sir John French as to make cooperation between the French Fifth Army and the BEF almost nonexistent. His successor was a vigorous, self-confident fighter who

could inspire his troops and who got along well with the British. Under the new commanders the French soldiers took heart and determined to stop the invader at any cost.

On August 26, Joffre appointed Gen. Joseph Gallieni governor of Paris. While Joffre prepared his mobile forces for the decisive battle, Gallieni looked to the defenses of the capital. He was a dynamic and distinguished veteran of the Franco-Prussian War and the colonial wars. With energy and determination rare in a man of his age, he put the neglected defenses of Paris in order, strengthening forts and building field fortifications in the intervals. Maunoury's Sixth Army entered the fortified area on August 30 and was put under his control. Gallieni constantly prodded Joffre to set the army in motion eastward and stop the retreat. On September 3, the French government departed for Bordeaux, leaving Gallieni in complete control of Paris, where his dash and enthusiasm heartened the people.

Joffre's plan for his counterattack, as outlined in his General Instructions No. 6, was simple. The Sixth Army, moving out of the entrenched camp of Paris, was to advance north of the Marne and cross the Ourcq River early on September 6. At the same time, the BEF and the other French armies were to attack with determination on their respective fronts. If this great counterblow failed, little would be left to the French to carry on the war. Fully realizing this fact, Joffre for the first time issued a direct appeal to his men. It began: "As we engage in the battle upon which the safety of our country depends, all must remember that the time for looking backward has passed. . . ." His brief message was greeted with eager response in all ranks, and the French Army steeled itself for a supreme effort.

Battle of the Ourcq.—Maunoury's Sixth Army marched eastward on September 5, so as to be in position to cross the Ourcq the next day. At the same time, Gen. Hans H. K. von Gronau's 4th Reserve Corps of Kluck's army was advancing

southward along the west bank of the river toward Meaux. Soon Gronau received reports of strong French patrols and of several strong columns of all arms. He realized that something important was taking place to his right, but he lacked aviation and was weak in cavalry for scouting purposes. Deciding that there was only one way of learning the significance of the French activity, he ordered an attack to the west by his entire corps. Maunoury was not expecting to fight on September 5, and initially his leading elements were thrown into confusion. They soon recovered their poise, however, and a violent fight ensued. The Germans gained the upper hand and pushed the French back all along the line. By dark it was clear to Gronau that he was dealing with no mere reconnaissance force, and he therefore withdrew his exhausted troops to a strong defensive position about six miles eastward.

Notified of the battle, Kluck reluctantly started his 2d Corps northward to help Gronau. Neither the French nor the German higher commanders seem to have appreciated the importance of this fight. Gallieni reported it as "a small successful engagement," while Kluck sent only the 2d Corps to intervene. During the next day (September 6), Maunoury engaged all the troops he had available, attacking frontally and also endeavoring to envelop the enemy's north flank. Each attempted envelopment was met by another German unit from south of the Marne. Kluck, still unconvinced of the seriousness of the engagement on the Ourcq, sent only the 4th Corps north during the day in response to appeals from the commanders on the Ourcq, and refused to move his other two corps, which were under fierce attack south of the Marne. Finally, a copy of Joffre's attack orders was picked up by the Germans on the battlefield. This made it clear that Maunoury was conducting a major offensive, and Kluck ordered his two corps on the Marne north to the Ourcq. Although their movement widened an already existing gap between the German First and Second armies, Kluck was confident that the British did not present a serious threat to the Germans. He admired the fighting qualities of the British troops, but since Le Cateau they had not paused in their hasty retreat, and he reasoned that they were unlikely to make a dangerous thrust at this time.

Meanwhile, Maunoury pressed his attacks vigorously on September 7 and 8. Gallieni rushed reinforcements to him from Paris, including two regiments of infantry sent in taxicabs.¹ Possessing numerical superiority, the French retained the initiative despite the arrival of Kluck's other two corps, but they gained little ground. On the evening of September 8, Kluck ordered a coordinated attack for the following day, stating: "The decision will be obtained tomorrow by an enveloping attack on the north wing. . . ." At the same time, Maunoury, having committed all of his troops and knowing that additional German forces had arrived, ordered the Sixth Army to pass to the defensive on September 9, and secretly directed his senior subordinates to prepare plans for a step-by-step retreat toward Paris. Victory seemed about to reward Kluck's fighting

¹Contrary to the popular impression at the time, this spectacular movement did not have an important influence on the battle, but it was significant in that it was the first movement of troops to a battlefield by motor transport.

spirit and iron determination, but events elsewhere had already made German failure inevitable.

Battle of the Two Morins.—Franchet d'Esperey's Fifth Army, beginning its advance on September 6 as scheduled, encountered Kluck's two corps south of the Marne. Fighting raged from noon until dark, when the Germans broke contact and withdrew to the line of the Grand-Morin River. Meanwhile, Franchet d'Esperey's right corps advanced unopposed to its objective for the day, but it was then struck by one of Bülow's corps and driven back. The first day's fighting by the Fifth Army thus was indecisive: Franchet d'Esperey now ordered a general advance for September 7. On that day, Bülow, fearful for his exposed right flank, ordered it behind the Petit-Morin River. The French followed up the withdrawal and attacked the new line unsuccessfully on September 8. By that time, Kluck's last two corps had moved northward to the Ourcq and were no longer supporting Bülow. His afternoon attack having failed, Franchet d'Esperey decided to attempt an attack that evening. The night attack was a complete success, piercing Bülow's line and forcing him to withdraw about six miles to a position facing west.

This movement so widened the gap between Kluck and Bülow that it could not be closed. Only two cavalry corps, aggregating about 10,000 men, were available to defend the gap. The British moved forward on September 6, but since they had retreated so far, their advance began from a position considerably behind the point from which Joffre had hoped they would start. Field Marshal French seemed in a position to strike a fatal blow to the Germans through the gap on his front between their First and Second armies, but his advance was slow. While the troops were eager to fight, their commanders, remembering Mons and Le Cateau, were over-cautious. The small German cavalry forces were handled with great skill, and it took the British three days to cover 25 miles. By the evening of September 8, the British had advanced to within artillery range of the Marne; that afternoon, Kluck's last two corps, the 3d and the 9th, crossed to the north of the Marne en route to the Ourcq.

The British advance into the gap, though much too slow, had put the Germans in a critical position. The British troops were nearing Kluck's rear, while Franchet d'Esperey's Fifth Army was in a position to envelop Bülow's right flank. For the Allies to exploit this favorable situation, however, it was necessary for Maunoury's Sixth Army to hold its own against Kluck's attacks on the Ourcq and for Foch's Ninth Army to prevent Bülow's left and Hausen's Third Army from breaking through.

Battle of the Marshes of St.-Gond.—Foch's Ninth Army (newly created from units of the eastern French armies) was scheduled to participate in Joffre's general offensive by attacking northward, but during most of the battle it was compelled to stand on the defensive because from the outset it was attacked by superior forces. In order to face Paris, as prescribed in Moltke's new plan, Bülow had to pivot on his right. In so doing, his two left corps ran into Foch's left and center. Hausen, driving his Third Army southward in accordance with Moltke's orders, ran into Foch's right. The French Ninth Army thus found itself in the path of the main efforts

of two German armies. Its position was strong in the center, fairly good on the left, and weak on the right. On September 6, Foch was fully occupied on his left and center with Bülow's troops. The French left held, though only with difficulty; the center, under fierce attack, was forced south of the marshes, where it then held. On September 7, Bülow resumed his attacks, and Hausen joined him against Foch's right, but the Ninth Army remained firm. The fighting was bloody and bitter all along the line; in the open terrain on Hausen's front the French light artillery was especially effective. Although Foch had considerable cause for concern, he held on.

Hausen decided to avoid the devastating French artillery fire by making a large-scale surprise night attack. Such an attack was a highly unconventional procedure at this stage of the war, and most of the German commanders thought it foolish. Nonetheless, Hausen attacked with four divisions at 3 A.M. on September 8, moving the infantry forward in the moonlight with fixed bayonets, unloaded rifles, and no artillery preparation. This innovation was a huge success. The attack swept three miles forward, throwing three French divisions into confusion and capturing 28 pieces of artillery. It seemed that the Ninth Army was crushed, especially when Bülow renewed his attacks against its left and center. Foch met the emergency by peremptorily ordering his hard-pressed troops to attack, which served to eliminate the possibility of retreat from their minds. French determination and German exhaustion, caused by two days of bitter fighting following weeks of hard marching, finally brought the enemy advance to a halt. It was at this critical time that Foch purportedly sent his famous dispatch to Joffre: "Hard pressed on my right. My center is yielding. Impossible to maneuver. Situation excellent. I attack."

Foch's Ninth Army had another hard day on September 9. Hausen, assisted by Bülow's left corps, launched violent and repeated attacks throughout the morning, determined to crush the French. Foch's troops were gradually driven back along most of the line, but, inspired by a series of imperative orders for local counterattacks and by news of successes gained by the French armies to the west, they held, though almost at the breaking point. Franchet d'Esperey lent some troops from his Fifth Army to Foch, and with these the latter was able to fill gaps in his line where necessary and to counterattack. Nonetheless, defeat still seemed imminent. At this critical juncture the German attacks lessened and then ceased. The German High Command had decided to withdraw from the Marne. Foch's stand is a classic example of self-sacrifice without hope of gain in order to make victory possible elsewhere.

Fighting to the East.—While the BEF and the French Fifth and Ninth armies engaged the Germans in the critical area of the Battle of the Marne, the French First, Second, Third, and Fourth armies to the east played their parts well in the over-all plan. Gen. Fernand L. A. M. de Langle de Cary's Fourth Army, after its defeat in the Battle of the Ardennes, had retreated step by step. On September 5, when it received Joffre's order for battle, it was between Foch's Ninth Army on the left and Gen. Maurice P. E. Sarrail's Third Army on the right. There were large gaps on both sides of the Fourth Army, which Langle de Cary lacked the troops to close.

His primary task, therefore, was to prevent the Germans from exploiting the gaps. Opposing him directly was the German Fourth Army under Albert, duke of Württemberg, and to the east of the latter was the Fifth Army under German Crown Prince William.

The battle opened on September 6 and for three days raged furiously. The German attacks were mainly frontal, and the French succeeded in stopping them; on the other hand, Langle de Cary's troops could not advance. Albert and the crown prince debated about which gap on Langle de Cary's flanks should be exploited. Moltke was requested to settle the dispute and, apparently not wishing to become involved between the two princes, replied: "It is desirable that the Fourth and Fifth armies lend each other mutual support." While these discussions were being held, reinforcements arrived from Lorraine, and the gap on Langle de Cary's left was closed. The princes then decided to attack the gap on his right, but Langle de Cary's right corps had stretched its front eastward so that the German attack became frontal. Being overextended, this corps was forced gradually to give ground, although it fought tenaciously. Relief came on the night of September 10, when the German Fourth Army broke off contact and withdrew to the north.

Sarrail's Third Army had retreated from the Ardennes until, on September 6, it occupied a position facing northwest with its right wing resting on the fortress of Verdun. When it moved forward that day to attack as Joffre had directed, it encountered the German crown prince's Fifth Army. Fierce combat continued for four days, during which time William tried unsuccessfully to exploit the gap between Sarrail's and Langle de Cary's armies. He then attempted to cross the Meuse south of Verdun in order to take Sarrail in the rear, but he could not subdue the little forts at the crossing points. On September 10, he returned to his attacks west of Verdun, but failed there also and withdrew northward.

The fighting on the front of the French First and Second armies was almost continuous from the opening of the Battle of the Frontiers to the end of the Battle of the Marne. After the Germans smashed the great French offensive in Lorraine on August 20, they followed up slowly and, on August 24, launched a drive that they hoped would carry them across the Moselle to penetrate the French lines. The French First and Second armies had recovered rapidly from their initial defeat, however, and in a counterattack not only stopped the Germans but hurled them back. There was a lull in the fighting from August 28 to September 3, during which time Joffre moved out large bodies of troops to bolster his threatened left. On September 4, in conformity with Moltke's revised plan, a strong German attack was directed against the heights of Nancy. Determined attacks were made until September 10, but to no avail, for the French, though inferior in strength, were in excellent defensive positions. Moltke finally realized that Schlieffen was right in that Lorraine was not a suitable area for major operations. He called off the attacks and began to move the Seventh Army to his weakened right on the Aisne, while the Sixth Army withdrew toward the frontier.

German Retreat.—When Moltke learned that Joffre had ordered a general offensive for Sep-

tember 6, he was pleased, because he was confident that if the French would only stand and fight, his armies could destroy them. On September 4, he had issued directives describing how the Allied forces were to be destroyed. All he could do now, he felt, was to rest at his headquarters in Luxembourg and wait for his orders to be executed. Communications between headquarters and the front were inefficient, and it was not until September 7 that he learned of the gap developing between his First and Second armies. Since it was obvious that general headquarters would now have to intervene, Moltke sent his chief of intelligence, Lt. Col. Richard Hentsch, to the right-wing armies to secure a complete picture of the situation. Moltke recognized that one or more of his strong-minded army commanders might already have begun a retreat, and he therefore authorized Hentsch to issue in his (Moltke's) name such orders as might be necessary to coordinate the withdrawal, close gaps in the line, or halt the rearward movement at a strong defensive position. These instructions were not reduced to writing, a fact that has caused much controversy.

On September 9, at Bülow's headquarters, Hentsch was informed that the German Second Army was in a precarious position (as it was) and would retreat behind the Marne and then behind the Vesle. He next traveled to Kluck's headquarters, about 50 miles away. Kluck was in the midst of his attack to envelop Maunoury's northern flank, and the attack was progressing well, but Kluck's southern flank had to be drawn back to avoid its envelopment by the advancing British. Hentsch invoked his authority and ordered that a retreat begin before the First Army was trapped. The attack was then halted.

When Moltke received Hentsch's personal report on the afternoon of September 10, he immediately ordered the right-wing armies (First, Second, and Third) to fall back and the others to halt. On the following day, he decided to visit the front, for the first and only time during the campaign. The impressions he gained on this trip were so unfavorable that he ordered a retreat to the general line Noyon-Verdun, which was to be fortified and defended. The German withdrawal was effected with little interference from the Allies. Severely tried by their marching and fighting, the latter failed to make a vigorous pursuit, thereby losing many of the fruits of victory. By September 14, the German armies were organizing their new prescribed positions for defense, and the Marne campaign was at an end. On that day, Moltke was relieved of his command by William II and was replaced by Gen. Erich von Falkenhayn. This change was kept a secret because it amounted to an admission of failure. To prevent the news from spreading, Moltke was required to remain at general headquarters until November 1, when his replacement was announced openly.

CONCLUDING OPERATIONS OF 1914

First Battle of the Aisne.—Although their pursuit was so slow that they lost contact at many points, when the Allies arrived before the new position on the Aisne, they attacked with vigor. The German position was on high ground about two miles north of the river. Spurs ran from this ground to the Aisne, giving the Germans surveillance of the river crossings. The Allies crossed the Aisne on September 13 against little resist-

ance, and the next day began a general offensive, with the British making the principal effort. Bitter fighting continued with negligible gains until September 18, when Joffre stopped the attacks.

This battle marked a transition from the open warfare that had preceded it to the stabilization of the front that ensued. It was the first battle in trench warfare and the forerunner of many such battles to come. The Germans had chosen and skillfully organized one of the strongest positions on the western front. Here they reaped the full reward of their prewar defensive training. Their skill with grenades, machine guns, and field fortifications gave them a great advantage in this type of fighting. Artillery came into its own in the battle. In such a stabilized situation the artilleryman had ample time for registration, and he developed great accuracy. Adjustment of artillery fire by airplane later became commonplace, and the consumption of ammunition reached rates unforeseen by prewar planners. The lack of medium and heavy artillery counted strongly against the Allies, for many targets in the rough hill mass before them could not be reached by their light, flat-trajectory field guns.

Fall of Antwerp.—Stabilization of the main battlefield on the Aisne left the Germans with their west flank near Noyon open and vulnerable. Behind them lay Antwerp with the entire Belgian Army of approximately 150,000 men. In order to relieve this dangerous situation, Falkenhayn ordered the city reduced at once. The Allies, especially the British, were anxious to hold Antwerp, hoping that the main line of battle eventually could be extended to include it, but it was difficult to send help. Actually, they had little to send, and they could not move what they had up the Scheldt by ship, for the neutral Netherlands controlled the mouth of the river and would not

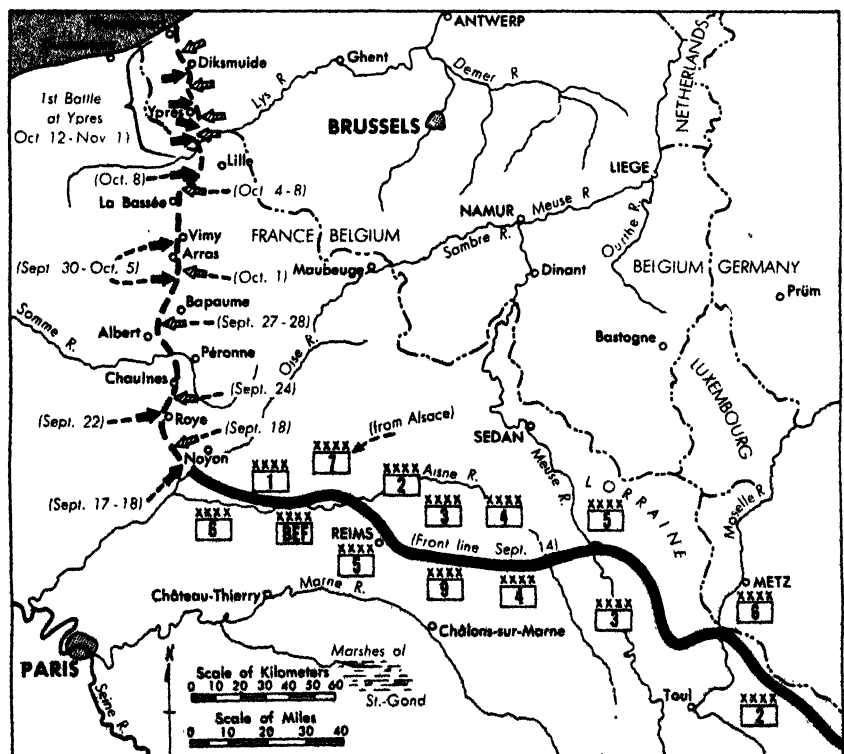

permit them to adopt this course.

The city had been considered one of the strongest fortresses in Europe, but the forts were easy prey for the heavy siege guns of the Germans, which knocked them out one by one. On October 6, King Albert moved out with the mobile army. Three days later, the city fell despite the efforts of Winston Churchill, first lord of the admiralty, who arrived with the Royal Naval Division, consisting of a brigade of marines and two brigades of naval Reservists. Two divisions of trained British Army troops had reached the vicinity of Bruges on October 6, and had started up the coast to lend their assistance at Antwerp. Meeting the retreating Belgians and Royal Naval Division, they fell back with them toward Ypres (Ieper).

Race to the Sea.—The successive operations that took place in September and October 1914 are commonly called the Race to the Sea, but the title is misleading. Neither contestant was trying to reach the sea; each was attempting to envelop his opponent's flank. In mid-September, when the Aisne front began to be stabilized, each side began to shift troops from east to west in an effort to envelop the other. Each attempt was successfully repulsed by the enemy, and the result was a series of bloody battles extending successively northward as the newly arrived forces collided. In the course of this maneuvering the BEF began a movement from the Aisne front to the vicinity of Ypres in Flanders.

First Battle of Ypres.—When the left flank of the Allied forces reached the sea, Falkenhayn decided to penetrate their lines in the vicinity of Ypres before they could organize their positions properly. This seemed an opportune time, because the front at Ypres and to the south was only lightly held pending the arrival of the bulk

FIRST BATTLE OF THE AISNE AND THE RACE TO THE SEA. After the Battle of the Marne the Germans withdrew to formidable positions along the Aisne. When their repeated frontal attacks against these positions failed, the Allies attempted to envelop the German flank on the north. This initiated a series of enveloping maneuvers by both sides, each determined to outflank the other, without significant success. Meanwhile, the front extended farther and farther north. The final clashes took place between the Lys River and the English Channel coast in the First Battle of Ypres (October 12–November 11). The Germans and Allies strove desperately to succeed in this last opportunity for envelopment. Fighting was bitter and bloody; heavy losses were sustained by both sides, but gains were insignificant. Exhausted, the opponents began to dig in and strengthen the positions held; trench warfare, which was to frustrate the Allies and Germans alike for almost four years, had begun.

of the BEF, which was then moving up from the Aisne. On October 12, Falkenhayn threw his full strength against the Allied position at Ypres, hoping to drive through to the Channel ports. For nine days he pressed his attack with vigor. On several occasions it seemed that the thin Allied line would break, and Joffre sent Foch to Flanders to coordinate the defense. While Foch had no command authority over the Belgians or the British, he did control the French reinforcements that were being sent to the north as rapidly as possible. His strong personality and determined fighting spirit soon gave him such influence over Field Marshal French that he was, practically speaking, able to direct operations as an Allied commander. This development was fortunate, for a firm coordinating hand was essential. The Germans had great superiority in numbers and artillery, but they were finally stopped.

On the left flank the Belgians opened the sluice gates in an effort to halt the Germans. An area two miles wide extending from Diksmuide to the sea was inundated to a depth of three or four feet, halting the German advance. The fighting there was bitter, however, and the Belgians lost 35 percent of their strength.

By October 20, the German attacks had been entirely stopped. Foch and French reasoned that the enemy must be exhausted, and since the entire BEF had now been assembled together with many French units, the Allied commanders decided to attack in their turn. This proved to be a costly error, for heavy rains were setting in, and the low-lying plain of Flanders was rapidly becoming a swamp. Furthermore, the Germans had brought up reinforcements and were in the process of bringing up more. The Allied attacks persisted with frightful losses until October 28, when Foch halted them.

On the following day, Falkenhayn, who had amassed a superiority of about six to one at the point of attack, resumed the offensive. A breakthrough was achieved in the British line south-east of Ypres on the third day of the offensive, but, by throwing in all of their reserves, the Allies managed to hold firm. Falkenhayn kept pressing his attacks to no avail until November 11, when heavy rains and snow finally brought them to an end.

The fighting at Ypres left the British in an unfavorable defensive position. This was a salient six miles deep with the town of Ypres at the center of its base. The Germans held positions on the surrounding hills that gave them excellent observation over the entire salient. The area was so low that construction of entrenchments was difficult, ground water being struck in many places at a depth of one foot. A far better defensive position would have been one extending north and south just behind Ypres, giving up the salient and the town. Ypres had become a symbol of Allied resistance, however, and the effect on public opinion of withdrawing would have been unfortunate. Accordingly, the troops held on to the town year after year.

Stabilized Front.—Ypres was the last major battle on the western front in 1914. Both sides dug in, and trench warfare began to take on the form that was to become so familiar in the next four years. In the autumn of 1914, however, the elaborate systems of field fortifications that were developed later were unknown. Over most of the front the trench system consisted of an irregular ditch with a depth equal to the height of a man

and another such ditch 200 or 300 yards to the rear. The forward trench was called the front line, and the one in the rear the support line. The area between the opposing positions was known as no man's land; it might vary in width from 30 to 800 yards. From the beginning the German defenses were superior to those of the Allies. They generally had been located with due regard for terrain, fields of fire, and observation, whereas the French and British front line was simply the place where the foremost troops had dug in at the end of an attack. The Allied policy was that ground once gained must never be given up (a good enough principle in its place), and this policy was vigorously enforced. As a result, the Allied positions, as at Ypres, were often poorly sited in sectors where excellent positions existed a short distance to the rear.

From the crude beginnings of 1914 both sides eventually evolved elaborate defensive systems, the German defenses usually being better than those of the Allies. With typical thoroughness the Germans constructed deep belts of wire entanglements, large dugouts where platoons and companies could find shelter from the heaviest bombardment, concrete pillboxes, and telephone and electric light systems.

When no major attacks were in progress, life in the trenches varied from extreme misery to passable comfort. Mud and cold brought great hardship, especially during the first winter, because neither side had yet learned the techniques of trench living. On the British front the offensive spirit was kept alive by constant patrolling, raids, mine warfare, and sniping. Except during offensives, the French were more inclined toward the tacit encouragement of a policy of live and let live, while the Germans adapted themselves to their opponents.

The breakthrough of enemy positions was to remain a dream for nearly four years. The line established in November 1914 did not move as much as 10 miles in either direction until February–April 1917, when the Germans voluntarily withdrew to the Hindenburg Line. Innumerable attacks, costing hundreds of thousands of lives, were to be launched with little or no result.

1914 IN RETROSPECT

The Schlieffen Plan and Plan XVII both failed completely. Under prevailing circumstances, Plan XVII was unrealistic and never had a chance of success. An erroneous estimate of the number of mobile German troops available caused General Joffre to minimize German capabilities for major operations west of the Meuse. The French attacks were directed over terrain highly unsuited for major offensive action. Moreover, an unreasonable faith was placed in the deeply inculcated French offensive spirit; 80 percent of the infantry officers were either killed or wounded during the first five months of the campaign. Joffre was responsible for the disastrous Plan XVII, but when his preconceived ideas collapsed in the Battle of the Frontiers, he did not lose his head or show signs of discouragement. Instead, he faced the situation calmly and shifted forces to the left wing for a counterblow. His control of his armies was close and intimate throughout the campaign. He had good communications and used his liaison officers freely. As a result, he was always familiar with the situation, and his subordinates were never in doubt as to what he wanted done.

The Schlieffen Plan depended for success on close control, speed of execution, and a strong encircling right wing. It failed primarily because of General von Moltke's lack of direction and control, for which inadequate signal communications were partly to blame. It is difficult to understand why the Germans, ordinarily precise and well prepared, neglected this vital field of military support. Moltke remained aloof in his headquarters far to the rear and let his subordinates have their own way. As a result, they not only failed to cooperate with each other but did not follow the strategic plan. All German commanders fell into the error of interpreting their successes at the frontier as decisive victories, and the planned French withdrawal as a rout. The exaggerated reports of success prejudiced the German operations in many ways. They led Moltke to give way to the importunities of Prince Rupert and General Krafft von Dellmensingen, and allowed them to hurl large numbers of Germans against small numbers of Frenchmen in good positions in the difficult terrain of Lorraine and the heights of Nancy, so that Joffre could assemble superior power on his left wing. Considering how close the French came to breaking on the Ourcq River and at the Marshes of St.-Gond, it seems reasonable to suppose that the additional strength provided by a resolute adherence to the original plan would have enabled Kluck, Bulow, and Hausen to gain a decision.

The Battle of the Marne proper was a great strategic victory for the Allies. It turned back the invader and eventually proved to be the turning point of the war. But it was not a great tactical victory. The German troops were not demoralized, as they soon demonstrated. Only about 15,000 German prisoners were taken.

Losses on both sides during the constant and heavy fighting were huge. By the end of 1914 the French had lost 380,000 killed and 600,000 wounded, prisoners, and missing in action; the Germans, because of their better training in defense, suffered to a slightly smaller extent.

6. Western Front: 1915–1917—Stalemate

The war in 1914 had been open fighting insofar as that term can be applied to the western front before March 1918, and its fluctuations had covered great distances. Only at the end of the year had it become trench warfare rather than warfare waged from scrapings in the ground where the forces on either side had halted. Now this state of affairs was to be changed, though it was not until 1916 that defenses were perfected, above all in the famous line named after Field Marshal Paul von Hindenburg, to which he withdrew from the battlefield of the Somme. Even the trenches of 1915, however, altered the whole character of the war, especially in winter.

OPERATIONS IN 1915

British Expansion.—At the opening of 1915 the British Expeditionary Force (BEF) had been

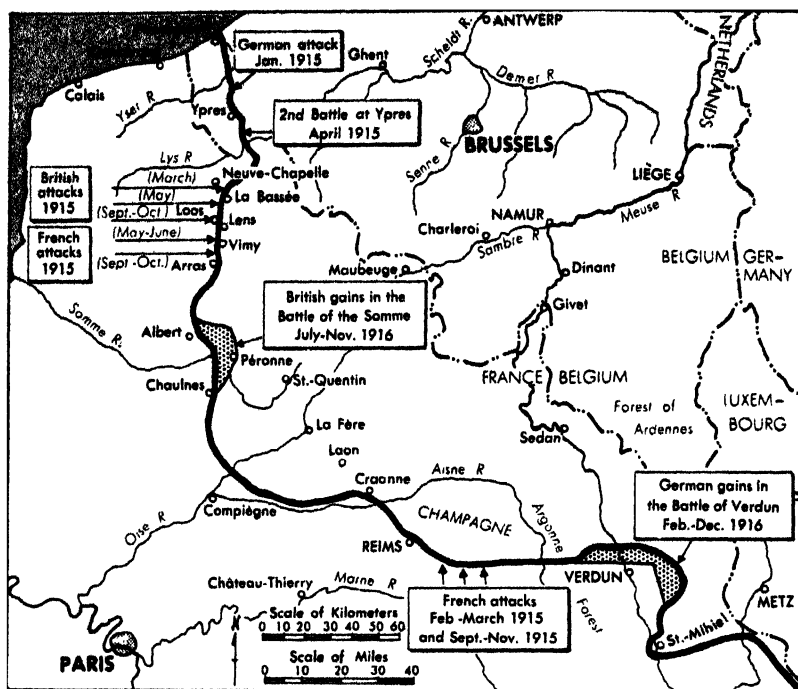

expanded from the original 6 divisions to a total of only 10, but in the course of that year its strength was raised to 37 divisions. While these included 2 Canadian divisions, the forces of Australia and New Zealand had been sent to Africa to oppose the Turks in Egypt. In South Africa, Gen. Louis Botha had to suppress a brief but painful revolt before he could fight the Germans in German Southwest Africa. The strength of the French on their own soil was 107 divisions, and that of the Germans 94. The majority of the remaining 65 German divisions were in Russia. Thus the main burden of the war in the west was being carried by France, and Britain, as the junior partner, was not able to make her voice heard in strategic matters.

Reorganization of British arms production began on June 9 with the formation of a Ministry of Munitions, of which David Lloyd George was the first head. His vigor and persuasiveness in office coincided with a great improvement in organization and output, for which he was accorded the credit by popular opinion. While his work was undoubtedly invaluable, the foundations had been well laid by the master general of the ordnance at the War Office. Of the guns issued to the army, 1,638 were from Woolwich Arsenal, 1,406 from the United States, and 25,512 from private armament firms. Of 55,000 aircraft, 1,502 came from Royal Aircraft Establishment factories.

German Plans.—The extremely able chief of the German General Staff, Gen. Erich von Falkenhayn, decided to make the east the principal theater of war, buttress the Austrians there, and administer to the Russians a defeat which, if it did not remove them entirely from the war (he did not believe this was possible) would render them innocuous for a long time to come. This policy accounts for the shift of German forces eastward and for the fact that Falkenhayn himself moved to proximity with the Austrian High Command. It was all the more essential that he do so because he found it necessary to keep Gen. Erich F. W. Ludendorff, Hindenburg's chief of staff, and Lt. Col. (later Maj. Gen.) Max Hoffmann, his director of military operations, under observation. These two generals intrigued against him and urged Hindenburg to oppose him, and it was only the implacable will of Falkenhayn and the loyalty with which Emperor William II supported him that enabled him to prevail.

Battle of Neuve-Chapelle.—The northern fringe of the Forest of Ardennes lies about 90 miles east of Arras, and the southern fringe about 25 miles north of Verdun. The Germans could avail themselves of only one first-class rail line south of the forest, and those lines which passed through it were inadequate for the supply of their southern front. The main burden was therefore borne by the fine railway system north of the Ardennes, and most of these lines passed through the bottleneck of Liège, between the forest and the salient formed by Limburg Province of the neutral Netherlands.

For his next offensive north of Arras to capture Vimy Ridge, Marshal Joseph Joffre had called on the British to relieve the two French corps still in the salient formed at the First Battle of Ypres (Ieper) in 1914. Field Marshal Sir John French (later 1st Earl of Ypres) believed that after the relief he would be unable to afford any adequate assistance to the Artois offensive of his allies, and his solution of the problem was

OPERATIONS ON THE WESTERN FRONT, 1915 AND 1916. During 1915 the Germans concentrated their efforts against Russia while defending themselves on the western front. The Allies made a series of limited attacks, as shown, but without success. At the Second Battle of Ypres the Germans introduced poison (chlorine) gas to modern warfare. By the end of the year the line had not changed more than three miles at any point. In 1916 the Germans launched the bloody battle of attrition at Verdun, and the Allies undertook their equally costly offensive on the Somme.

therefore to attack before the relief. His First Army commander, Gen. Sir Douglas Haig (later 1st Earl Haig), with his brilliant staff officer, Brig. Gen. John Edmond Gough, made excellent preparations for the attack.

The assault on Neuve-Chapelle, which was launched on March 10, won complete surprise, opening a gap in the enemy's front. The Germans were unable to launch a counterattack, and such reserves as reached the scene (four battalions from four different regiments) were entirely engaged in efforts to patch holes in the line. On the following day, however, British progress had scarcely begun when the Germans, who in the course of the night had assembled 16,000 men for the purpose, launched a belated counterattack. Only at a few points did it recover any ground, but it achieved its ends by bringing the British advance to a halt, and the battle ended on March 13.

Second Battle of Ypres.—Falkenhayn was now tempted to make use of his "secret weapon," poison gas (q.v.). At 5 P.M. on April 22, after a fierce bombardment, Algerian *tirailleurs* were seen in headlong flight toward Ypres, some pointing to their mouths and croaking the word *gaz*. The commander of the British Second Army, Gen. Sir Horace Lockwood Smith-Dorrien, issued orders for the re-establishment of the front, but the first troops available consisted only of the reserve Canadian brigade. Though a second gas attack on April 24 inflicted heavy casualties on the Canadians, they succeeded in halting the Germans.

On April 27, Smith-Dorrien decided that the time had come for a voluntary withdrawal to the outskirts of Ypres. When the order reached headquarters, French told him to turn over his command to Lt. Gen. Sir Herbert C. O. Plumer (later 1st Viscount Plumer). The latter issued precisely the same orders as had Smith-Dorrien, however, and this time French accepted them. The

withdrawal began on May 1, and the battle came to an end after a new German attack on May 24-25. British losses at Ypres amounted to 60,000, or almost twice the German total of 35,000. For the next two years the burden of holding the reduced Ypres salient became almost intolerable.

Second Battle of Artois.—On May 9, the French launched their long-planned attack in Artois. Their troops were their best and were inspired by traditional French élan. Their optimism was justified at the start, when they secured a foothold on the crest of Vimy Ridge, but this was lost, and the battle ended in a deadlock on June 18. French losses totaled 100,000, and those of the Germans 75,000.

Autumn Offensives.—A series of offensives in the autumn of 1915 fared little better. One in Champagne (which became known as the Second Battle of Champagne) was postponed until September 25 because Gen. Victor L. L. d'Urbal in Artois estimated that his preparations could not be completed earlier. The Second Army of Gen. (later Marshal) Philippe Pétain and the Fourth Army of Gen. Fernand L. A. M. de Langle de Cary broke the German lines, but Falkenhayn's perspicacity and his immediate arrival on the scene stopped the deep withdrawal contemplated by his subordinates and restored the front. The battle ended on November 6. The Artois offensive (known as the Third Battle of Artois), which lasted from September 25 to October 15, was even less successful, as was that portion of it fought by the British at Loos.

OPERATIONS IN 1916

Battle of Verdun.—The aim of Falkenhayn in 1916 was to lower French morale, which he suspected had already been weakened by defeatist propaganda. He chose for the front of attack the region of Verdun because he was confident that the French would be induced by the prestige of its name to fight for it to the last man, and

quick and clever in shifting the weight of an attack from a strong to a weak point of resistance, and their handling of their artillery was masterly. The French had no opportunities for such nicety of tactics because they were limited to straight counterattacks, but two commanders earned exceptional reputations. These were Gen. Robert Georges Nivelle, who came in as a corps commander and succeeded Pétain in command of the Second Army; and Maj. Gen. (later Gen.) Charles Mangin, who commanded the 5th Division and somewhat later was promoted to the command of a corps. The French were, however, plagued by a series of panics, which involved unnecessary withdrawals. These did not include the loss of Fort Douaumont on February 25, because it was ungarrisoned and was taken by a single German company. Here, too, the situation changed speedily. On April 10, a German assault south of the fort was shot to fragments, and as a consequence the best German corps commander, Gen. Bruno von Mudra, was replaced by Gen. Ewald von Lochow. The French artillery was also brilliant. The German giant howitzers in very many cases were destroyed, and throughout the battle they were harried mercilessly by the French long 155-mm. guns.

In the final phase of the Verdun offensive the Germans slowed down still further, but they gained one more outstanding success on the right bank of the Meuse River. Pétain had realized the falsity of the prewar doctrine that the forts of Verdun should be dismantled and their guns used in the field. He had done all that lay in his power to remedy the situation by providing the forts with permanent garrisons of about 300 men each. On the German side the crown prince's resolute chief of staff, Gen. Konstantin Schmidt von Knobelsdorf, obtained permission to attempt the capture of Fort de Vaux and, if successful there, of Forts Souville and Tavannes

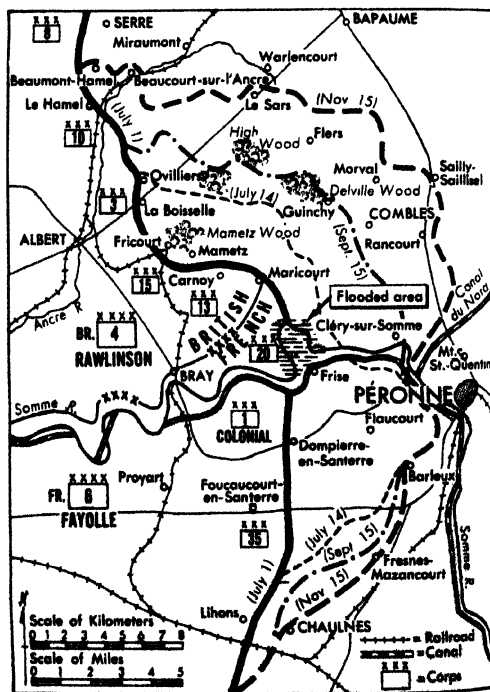

as well. The defense of Vaux by Maj. Sylvain Eugène Raynal was heroic. After the fort had been completely surrounded, he fought on desperately, repulsing attack after attack and surrendering only when the water supply gave out on June 7.

For the attack on Souville and Tavannes on June 21, the Germans used the lethal green-cross gas shell but were completely routed. Although the fighting continued until July 11, this was the real end of the offensive. Its only achievement had been to reduce the French contribution on the Somme. French casualties totaled 315,000; German casualties, 280,000.

Later, on October 24 and December 15, Nivelle and Mangin launched two successful attacks at Verdun. These won back a large proportion of the ground lost and almost all that counted.

Battle of the Somme.—Once more General Haig had the experience of fighting a battle in the wrong place, since the Somme Valley was barren of major strategic objectives. The terrain was poorly watered, and the population was sparse. The toil of excavating dugouts in the chalk, which had begun early in the year, was immense.

The assault was launched on July 1 under the command of Gen. Emile Fayolle and Gen. Sir Henry Seymour Rawlinson (later 1st Baron Rawlinson).

BATTLE OF THE SOMME (July 1–Nov. 18, 1916). In conformity with their over-all strategic plan for 1916—and to relieve the pressure on Verdun—the Allies launched an offensive across the Somme River against what were perhaps the strongest German defenses on the western front. Immense preparations were made for the attack, including a seven-day bombardment. The British Fourth Army, making the main attack, advanced in dense formations and suffered many casualties. The Allies gained some territory but no particular strategic or tactical advantage. The battle developed into an even greater struggle of attrition than Verdun. The Germans lost 450,000 men; the British, 420,000; and the French, 195,000. In this battle, the British introduced the tank to the battlefield.

inson), who were opposed by Gen. Fritz von Below. Fayolle could muster only five divisions in the first line astride the Somme, but he was much stronger than the British in heavy artillery. His success was complete. The British 13th Corps on the French left did equally well, but this was the end of success. The British suffered overwhelming defeat and great casualties, the loss for that day amounting to 57,450. There was nothing Haig could do but confine the attack to the area on which ground had been won. He formed a new army, the Fifth, under Lt. Gen. Sir Hubert de la Poer Gough, for a holding operation on the Ancre River. The Germans did likewise, putting Gen. Max von Gallwitz in command of a new army south of the Somme.

The fortunes of the battle fluctuated in succeeding weeks. Haig had adopted the policy of attrition as completely as Joffre had, while Gen. (later Marshal) Ferdinand Foch, the army group commander, had never believed in the Battle of the Somme except as a means of relieving the pressure on Verdun. On August 29, Falkenhayn was dismissed by the emperor. Hindenburg, his successor as chief of staff, came west with General Ludendorff.

On September 15, the British launched a general attack on a 10-mile front. For the first time they used 36 units of the weapon of the future, the tank, with considerable success. Haig has been criticized for disclosing the new weapon prematurely and thereby losing the element of surprise, but this verdict is of doubtful validity in view of the fact that he had available almost precisely the same number of tanks at Arras in the following spring. What is indisputable is the widespread impression that both Haig and Joffre wasted lives on the Somme. Joffre was regarded in France as being immersed so deeply in petty problems, harassed so greatly by the task of placating politicians, and at the same time presiding over what amounted to a ministry of war at Chantilly, as to be out of date. Premier Aristide Briand made every effort to save him by bringing in a new fighting subordinate and leaving Joffre in general control. It could not be done. The part played by the new man was honorable, but Nivelle was destined to the supreme command. In December, Joffre and Foch were both retired.

Meanwhile, the Battle of the Somme ended on November 18. The casualty figures, which have been much disputed, were as follows: German, 650,000; British, 420,000; and French, 195,000. In all, 95 German divisions (including those which entered the battle more than once), 55 British divisions, and 20 French divisions were engaged.

OPERATIONS IN 1917

The year 1917 opened with several promising peace proposals. First came that of President Woodrow Wilson. On Dec. 18, 1916, he had addressed circular notes to the American diplomatic representatives accredited to the belligerent governments. These were not offers of mediation but requests for statements of terms; in fact, the governments of the Central Powers did not venture to disclose their terms, while those of the Allies sent Wilson wholly unacceptable terms that included the division of the Austro-Hungarian Empire. On Jan. 22, 1917, Wilson addressed to the Senate a speech that called on the belligerents to accept "a peace without victory," and

Flamethrower sets battlefield afire as Germans defend their lines against an approaching British tank.

reached its apogee in its delineation of the American people as peacemakers. Only 10 weeks later, however, the president led the United States to war. This change of view was due to the German decision, announced on January 31, to reintroduce unrestricted submarine warfare. Another peace appeal, that of Pope Benedict XV, also failed, as did that of the new Austrian emperor, Charles I, made through the medium of his brother-in-law, Prince Sixte (Sixtus) of Bourbon.

The British people hoped that the aid of the United States would be instant and overwhelmingly strong, but the government and the fight-

ALLIED OFFENSIVES IN 1917. The principal Allied offensive of 1917 was to be a great French attack on the Aisne, preceded by a British attack in the Arras area to draw German reserves away from the river. The Germans, apprised of the plan, withdrew voluntarily to the Hindenburg Line. The French attack on the Aisne was repulsed with such enormous losses as to cause widespread mutiny in the French Army. Primarily to occupy the Germans while the shattered morale and confidence of the French were being rebuilt, the British launched successive offensives at Messines, Ypres, and Cambrai. These attacks made moderate gains and succeeded in preventing a German offensive against the disorganized and weakened French.

ing forces were well aware that this was impossible. The one powerful and immediate military aid that the United States could afford was naval. By June 5, 34 American destroyers were based on Queenstown (now Cobh), from which they joined in the antisubmarine warfare in the Atlantic.

By far the most important event of the year, however, was the revolution in Russia. The Petrograd Soviet of Workers' and Soldiers' Deputies, formed on March 12, compelled Czar Nicholas II to abdicate. He was replaced by a provisional government in which Alexander Kerenski became minister of war and, later, prime minister. Kerenski was determined to maintain the war against the Germans, Austrians, and Turks. He found Gen. Aleksei Brusilov, the best of the Russian generals, ready to become commander in chief and confided to him all the most reliable troops, especially the Siberian. The offensive, which was launched on July 1, began with a heartening success, but the process of demoralization had gone too far, and the bulk of the troops were soon streaming homeward. The end came with the Bolshevik Revolution of November 6-7, and the accession of Lenin and Leon Trotsky to power. Armistice talks with the Central Powers opened at Brest-Litovsk (now Brest) on December 3. Russia had been driven from the war in the same year that the United States entered it, but Russia was armed and, unfortunately for the Allies, the United States was not.

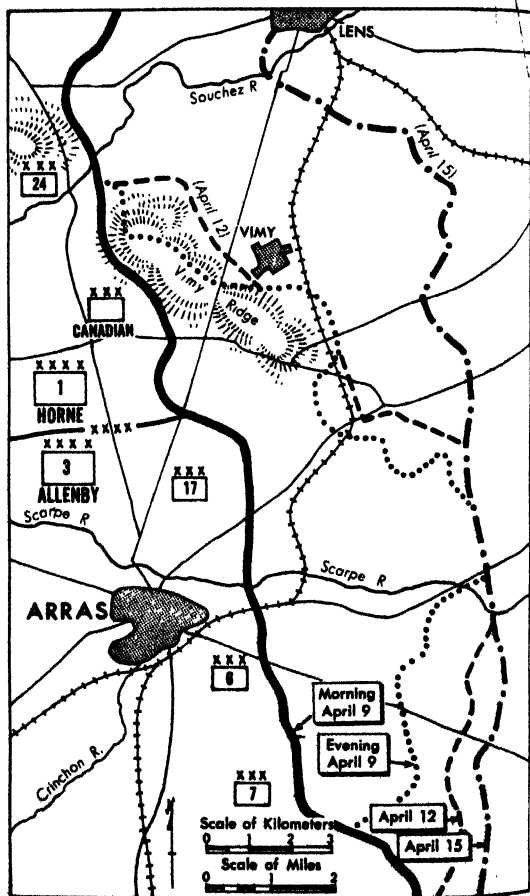

Nivelle's Offensive.—Meanwhile, Nivelle had put into operation plans differing vastly from Joffre's cautious program. His theory was that what could be and had been done on a small scale could be done on the greatest scale yet envisaged in the war. The chief component of his tactics was lightning speed, but his gunner's eye showed him exactly how far he must go in the first rush after his colossal bombardment was over: the line of the enemy's field batteries. The second component was surprise. Such reserves as the enemy could bring into the breach were to be destroyed, after which the huge French reserve would push forward.

There must, however, be a single great diversionary attack, and this was allotted to the British. Through a secret agreement with the French government, made at Calais without the knowledge of his own commander in chief, the new prime minister, Lloyd George, had arranged to place Haig under Nivelle's orders. Nivelle interpreted this as making Haig no more than an adjutant and quartermaster general, looking after his troops and serving as an intermediary between the British government and the French commander. This arrangement was subsequently modified so that Haig retained absolute command of the British Army and had the right to appeal against French orders if he considered that they placed him in peril, but he remained suspicious.

Everything else that could well go wrong did so. The retreat of the Germans to the strong defensive position of the Hindenburg Line, which was completed by April, was disregarded by Nivelle, although it placed at their disposal large reserves. Carelessness which involved the German capture of two vital documents in trench raids revealed the exact boundaries of the attack between Reims and Soissons. The army group commander, Gen. Joseph Alfred Micheler, who had been chosen by Nivelle because Pétain disapproved of the plan, finally

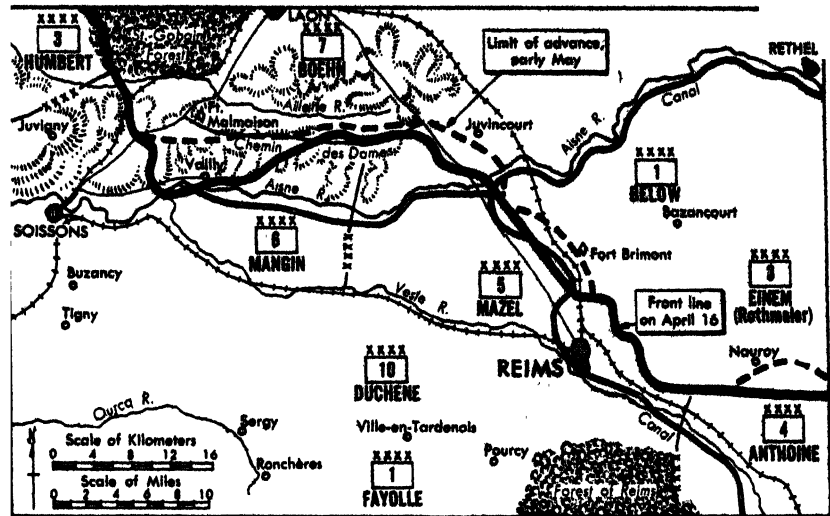

disapproved of it just as heartily.

Nevertheless, the attack, in what became known as the Second Battle of the Aisne, began on a grand scale on April 16. The troops of Generals Mangin and Olivier C. A. A. Mazel dashed forward with gallantry and confidence, but German machine guns soon called at least a partial halt to the advance. This had been a commonplace in previous battles, but it was fatal to the new theories of Nivelle. Moreover, many of the 200 French tanks were destroyed. On the following day, Nivelle achieved a substantial success when the enemy was driven from the Fort Malmaison salient for a gain of two and one-half miles, and though this could be described as a voluntary withdrawal, it involved the loss of a great quantity of German artillery. Finally, however, the continuation of the offensive was postponed by the French cabinet until May, when it failed again. Meanwhile, on April 29, Pétain was appointed chief of the General Staff, and on May 15 he superseded Nivelle, being himself replaced by Foch, who came out of retirement to serve as chief of staff.

BATTLE OF ARRAS (April 9–May 3, 1917). The German withdrawal to the Hindenburg Line had invalidated the Allied plan for their 1917 offensive; nevertheless, Gen. Robert Georges Nivelle, the French commander, persisted in going ahead with the attack on the Aisne. The plan provided for an initial British offensive at Arras to draw German reserves away from the Aisne. This offensive had great initial success, but was soon halted by stiffening resistance. The only important gain was the capture of Vimy Ridge by the Canadian Corps, which provided a firm northern anchor for the British in the first great German drive of 1918.

SECOND BATTLE OF THE AISNE (April 16–May 9, 1917). In the area chosen by Nivelle for his great offensive the French armies would have to attack across three steep ridges, including the formidable Chemin des Dames, cut by ravines covered by woods and heavy undergrowth. Since Nivelle had publicized his coming offensive the Germans had had ample time to convert these natural barriers into a veritable fortress. The offensive was poorly organized and fell into confusion from the start, and by nightfall of the first day it was evident that the attack was a failure. Nonetheless, Nivelle persisted in ordering successive futile and costly attacks. By early May, widespread mutiny had broken out in the French armies.

There has been much dispute about French losses in the offensive, Nivelle's bitterest opponents alleging that they were actually twice as large as the figures announced. The probability, however, is that they were not much higher than those listed in the French official history, or 96,000. The Germans lost 163,000 men. Their gains and the French losses were augmented by the destruction of French morale in widespread mutinies. The number of verdicts of guilty was 23,385, but only 55 men were shot. The French Army was out of action for a considerable time.

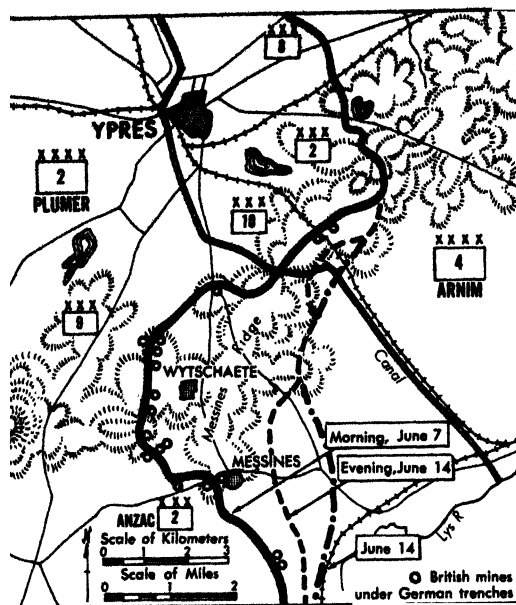

Battle of Arras.—Haig began 1917 as a field marshal, secure in the confidence of George V, who wrote after the Calais conference: "The King begs you to dismiss from your mind any idea of resignation. Such a course would be, in His Majesty's opinion, disastrous to his Army and to the hopes of success in the coming struggle." The offensive to which he was pledged in support of Nivelle extended from approximately eight miles south of Arras to seven miles north of it, and was to be carried out by the Third Army of Gen. Sir Edmund Allenby (later 1st Viscount Allenby) on the right and the First Army of Gen. Sir Henry Sinclair Horne (later 1st Baron Horne) on the left. The whole of the German front was under the command of Gen. Baron Ludwig von Falkenhausen. The initial attack was to be made by 14 divisions, but for the first time the British were not undergunned and had at their disposal 2,800 pieces. The Germans had 6 divisions in the line, but they also were in the novel situation of possessing abundant reserves—another 6 divisions.

The attack began successfully on April 9, in squally, snowy weather, even though the tanks were an almost complete failure, all of them being either ditched before they went into action or speedily maimed when they did so. The advance immediately north of the Scarpe River was the deepest made by any belligerent since trench warfare had frozen the western front. Here Lt. Gen. Sir Charles Fergusson's corps breached the German third line, captured the village of Fampoux, and covered a distance of three and one-half miles. Horne's army prospered as greatly as Allenby's did, but the Canadian Corps of 4 divisions, which bore the main

burden in the assault, had not far to go on the muddiest part of the front to the crest of Vimy Ridge. The ridge was not completely secured by nightfall, but little was left for the following day.

That day provided a rude shock. Allenby's simple telegraphed order overnight to pursue a beaten army was issued under a misapprehension. The army was indeed beaten, but there was another of equal strength in the rear. Falkenhausen had disobeyed orders so that he could keep his reserves out of range, and they were on the average 15 miles farther east than they ought to have been. Now they were ready to fight, while the original British divisions were exhausted. Nothing serious could be attempted until April 23, when in a two days' battle the British outfought the enemy but made small progress. The last phase of the battle was the single day of May 3, when Haig permitted the attack to proceed solely in the hope of aiding Nivelle to keep the French fighting. Intervention by Gough's Fifth Army on the right at Bullecourt led to the terrific slogging described in detail in the writer's official work, *Military Operations: France and Belgium, 1917* (vol. 1, London 1940).

Battle of Messines.—Haig now turned to Flanders and the operation which had been in his mind since February, the clearance of the Flemish coast, the only place where a flank could be found and rolled up. He was already under heavy pressure from Pétain to keep the Germans off the French, and from the British Admiralty to root out the submarines based on Bruges and making their sorties from Ostend (Oostende) and Zeebrugge. The first part of the program was the capture of the Messines (Mesen) Ridge, the steepest approach; after this had been accomplished, the main advance was to be made toward Roeselare (Roulers) and Thourout (now Torhout). The most remarkable feature of the battle was a great chain of mines, the earliest of which had been begun two years before, which had been driven into the bowels of the ridge, two of the galleries being 2,000 yards long. At zero hour, 3:10 A.M. on June 7, the mines were exploded with tremendous effect. The nine divisions of Plumer's Second Army

BATTLE OF MESSINES (June 7-8, 1917). With the French armies almost prostrate on the Aisne, the main weight of the war fell on the British. At the same time, the collapse of Russia made it necessary to strike a vital blow on the western front before German strength could be transferred from the eastern front. The British chose the Ypres area, where a breakthrough would outflank the entire German defensive system; but first the Messines Ridge, which gave the Germans perfect observation over the British lines south of Ypres, had to be cleared. In a brilliant, well-planned, and perfectly executed operation (in which hundreds of tons of mines were placed under the German position) the ridge was quickly captured.

swept through to the crest of the ridge. Crown Prince Rupert of Bavaria immediately ordered all troops to fall back behind the Ypres-Comines (Komen) Canal.

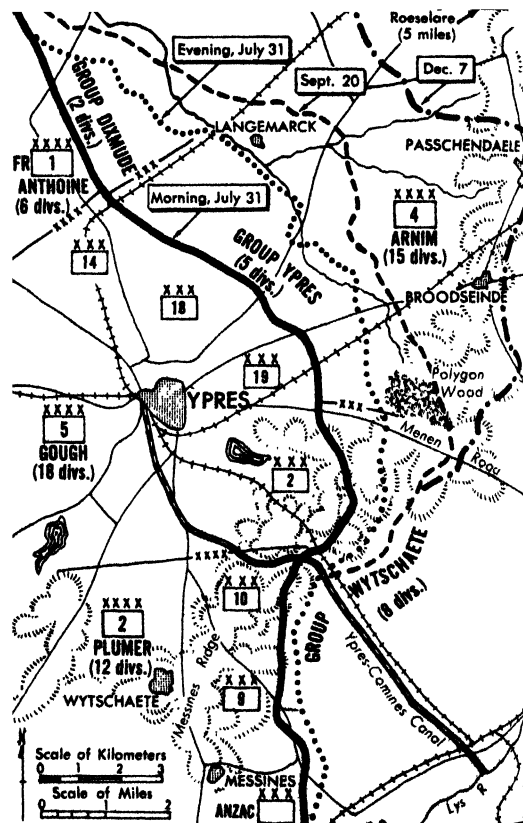

For the main battle, Haig had brought up Gough and the headquarters of the Fifth Army to divide the command with Plumer. Feeling that the moment was appropriate for displaying greater dash than was likely to come from this cautious veteran, he allotted the main role to Gough, though Plumer had not left the Ypres salient since he superseded Smith-Dorrien and knew it well. The result was a delay caused by the adaptation of Plumer's methods to Gough's, and this was accentuated by a slow concentration of the small, elite First French Army commanded by Maj. Gen. François Paul Anthoine.

Third Battle of Ypres.—The interval since the assault on the Messines Ridge had been one of cloudless hot weather, and this continued on July 31, when the Third Battle of Ypres began. The attack did well and, even after Gough's left had been robbed of a considerable amount of ground by fierce and gallant counterattacks, retained a maximum advance of two miles. That evening the weather broke. The Battle of Langemarck (now Langemark) was fought on a dry day on August 16, but remission for a day or two no longer counted. The shell holes were filled to the brim with water. Every round of ammunition had to be carried over the final stage on pack saddles, and many mules and a considerable number of men were drowned. Haig had to reverse once more the roles of his two army commanders, and the sideslipping required for

the purpose wasted still more time.

Plumer had determined to act with extreme deliberation, securing the Ypres Ridge with divisions closed down to 1,000-yard frontages, often with two of the three brigades in support and reserve, tremendous barrages, and very limited objectives, in three separate thrusts. The skilled and devoted work of the Royal Engineers in constructing plank roads and laying duckboards enabled him to assault in maximum strength, and he was also helped by miraculous good fortune. The first two battles, Menin (Menin) Road Ridge (September 20-25) and Polygon Wood (September 26-October 3), were actually fought in clouds of blinding dust, and though the rain had recommenced on October 3 before the third battle, Broodseinde, the ground was still in excellent condition. This time, however, it had to be taken for granted that the weather had broken for good, and it was now autumn.

The last phase of the battle (October 26-November 6) resulted in the name of the village of Passchendaele (now Passendale), which covers a single final incident, having been ex-

THIRD BATTLE OF YPRES (also called Battle of Passchendaele; July 31-Nov. 6, 1917). With the Messines Ridge cleared, the British launched their Ypres attack. A 10-day preliminary bombardment churned up the sticky clay, thereby slowing the advance. Nevertheless, the first day's objectives were captured despite German counterattacks. Then a 14-day heavy rain bogged down guns and transportation. Tactical success was no longer possible, but, with the French armies demoralized, continued British pressure on the Germans was essential to prevent disaster. Flooding along in the mud and subjected to mustard gas, which was added to the horrors of the battlefield by the Germans, the British finally captured Passchendaele on November 6, and the battle ended.

panded in popular parlance to cover the whole Third Battle of Ypres. The losses associated with it also led to bitter criticism of Haig. The British loss for the entire battle was 240,000, and the German loss almost precisely the same; 37,000 prisoners were taken.

French Victories.—Pétain was eager to contribute all he could, both to aid the British offensive and to test the recovery of the French Army and encourage its self-confidence. The first of these experiments was the victorious blow struck by Gen. Marie Louis Adolphe Guillaumat and his Second Army on August 20 near Verdun. It was an invaluable effort, but the anxiety it created in German minds was brief, though Ludendorff for the next month or so expected the foe to try again. The second and more famous episode was delayed until the end of the main battle on October 23 and was carried out by the Tenth Army, commanded by Gen. Paul André Marie Maistre. By November 1, the attack had recaptured Fort Malmaison and secured 12,000 prisoners.

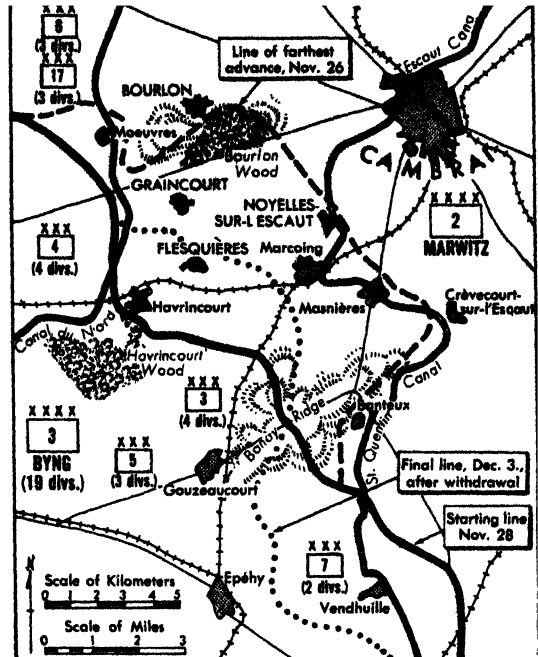

Battle of Cambrai.—As the year 1917 drew to its end, Haig realized that at most one more offensive would be possible before he and the French faced the full flood of the German divisions set free by the Russo-German armistice. By the end of October, he was doubtful whether even that much would be possible. Between October 24 and November 11, Austro-German forces won a brilliant victory over the Italians in the Battle of Caporetto (now Kobarid). The rout ended on the Piave River after 11 Franco-British divisions had been sent to Italy from the western front, but before they had been in action.

Meanwhile, Haig's problem was that he was still unsure of how many troops he would have to send to Italy (actually, the British contingent was reduced to 5 divisions, whereas the French sent the original quota of 6). This anxiety was, however, mild by comparison with his satisfaction that tanks were at last to be used as their creators had foreseen, and that he could allot the Third Army of Gen. Sir Julian H. G. Byng (later 1st Viscount Byng) 324 tanks, as against the 48 in action at Arras. Moreover, owing to new artillery methods, especially sound ranging and flash spotting, every German battery could be pin-pointed, a preliminary bombardment could be dispensed with, and complete surprise could be achieved for the first time.

At 6:20 A.M. on November 20, the fire and the advance of the tanks began simultaneously. By evening the advance exceeded three miles, and it might have been far greater but for the one calamity of the battle at Flesquières, where a single German field battery knocked out tank after tank as they breasted the rise, and the supporting infantry could not force a way through the wire of the Hindenburg Line while it remained uncut. The battle now resolved itself into a fight for the height surmounted by Bourlon Wood, which was taken and retaken.

Ludendorff saw exactly what was required. He massed his reinforcements on the flanks of the bulge between Banteux and Moeuvres and directed Gen. Georg von der Marwitz, commanding the Second Army, to eliminate it by convergent thrusts. Marwitz struck at 8:30 A.M. on November 30, after a bombardment maintained all night and on the southern flank won a great victory. The German infantry had never

fought with greater enthusiasm or tactical skill. Disdaining the heights which commanded the valleys, it made use of these to paralyze the defense. The attack not only smashed the British array on the new front, but captured the original position farther south on a frontage of three miles. The Guards Division recovered Gouzeaucourt, however, and brought the enemy's advance to a halt.

BATTLE OF CAMBRAI (Nov. 20–Dec. 3, 1917). As a possible solution to the breaking of the stabilized front, the British launched a massed attack of almost 500 tanks at dawn on November 20. Cavalry followed closely to exploit the hoped-for breakthrough. The attack gained spectacular initial successes, but by nightfall the tanks and cavalry had become stalled along the difficult St.-Quentin Canal. For the next few days bitter fighting took place for Bourlon Wood; by November 26, the advance had progressed only to the line shown. On November 30, an overwhelming German counterattack drove the British steadily back. By December 3, they had stabilized their lines, retaining some ground gained in the center, but losing an equal amount of their original holdings to the south. This first massed tank attack had failed; but it indicated great promise for the future.

The same tactics were employed on the northern flank, but on more open ground with better observation they did not meet the demands of the situation. The guns were firing over open sights, shooting the successive waves to fragments, and when the accompanying batteries strove to unlimber, they laid out the horses so that the guns were thenceforth stationary. Prince Rupert and Marwitz called off the battle on the night of December 1. Between December 4 and 7, Haig had to yield a few more of his gains in order to obtain a defensible front based on the Hindenburg Line. His losses totaled 43,000 men, including 6,000 prisoners taken on the first day of the counteroffensive; those of the Germans, 41,000 men, including 11,000 prisoners. The British public, which had listened to the premature ringing of church bells, was bitterly disappointed by the reversal of fortunes and staggered by the loss of guns:

158, as contrasted with 138 taken from the Germans.

The most interesting feature of Cambrai was its significance for the future. The tactics and strategy of World War II were first developed in this battle, and the victories of 1918, beginning with the reduction of the Amiens salient on August 8–September 3, depended on it to an equal extent.

7. Western Front: 1918—The Year of Decision

At the beginning of 1918 the Allied situation was critical. Though Gen. (later Marshal) Philippe Pétain had succeeded in quelling the mutinies that followed the disastrous attacks of Gen. Robert Georges Nivelle on the Aisne River in April 1917, French morale had not been completely restored. Three years of bitter offensive fighting had so depleted France's manpower that much of her infantry now consisted of men too young or too old to be the most effective fighters. The British personnel problem was also acute. Infantry units were composed mostly of replacements, but their morale was much better than that of the French, and they could be depended on to fight. Prime Minister David Lloyd George, however, fearing that Field Marshal Sir Douglas Haig (later 1st Earl Haig) would repeat his costly and futile attacks of 1917, refused to send large reinforcements to the Continent. Haig was forced to reduce the battalions in his divisions from 12 to 9, thereby generating resentment among the officers and men whose units were disbanded.

The Italian disaster at Caporetto (now Kobarid) in October 1917 had necessitated the dispatch of 11 precious Allied divisions to bolster the faltering Italians, who even by 1918 had not fully recovered. Russia and Rumania had been knocked out of the war by the Germans, and American troops were slow in arriving. On March 1, 1918, nearly a year after she had entered the war, the United States had only 6 divisions in France; of these, 2 lacked combat experience, and the other 4 had served only in quiet sectors. The only recourse for the Allies seemed to be to hold fast on the western front until American forces arrived in sufficient strength to launch a general offensive. The French and British accordingly took up a defense in depth over most of the front (similar to the defensive system developed by the Germans in 1917) and braced to meet the German onslaught, which was sure to come. Haig and Pétain agreed to assist each other promptly in case of attack, but there was no unity of command to guide the Allied effort forcibly. The Supreme War Council, with no troops under its control, could act only as an advisory body. A plan to form a 30-division general reserve under the council's control had been vitiated by Haig's contention that he could not spare any divisions and still retain responsibility for his front.

The general situation of the Germans was little better than that of the Allies. Although submarine warfare had greatly reduced Allied shipping, it had failed to starve Great Britain or

to halt the flow of American troops across the Atlantic. Conversely, the Allied blockade, coupled with the inefficient use of the internal transportation system, was causing hunger and discontent among the German people. Germany's allies were faltering: Austria-Hungary, through popular pressure, refused to send troops to the western front, preferring to concentrate her forces against the Italians; Turkey's armies had been futilely expended in Mesopotamia and Palestine; and Bulgaria was war weary. Nevertheless, the German manpower situation was more favorable than that of the French and British, for the collapse of Russia had released sizable German forces from the eastern front. Many of these divisions, having seen little fighting for almost a year, were fresh, and their troops were eager to fight.

Gen. Erich F. W. Ludendorff, through his string of victories, keen intellect, and strong personality, had by now overshadowed Emperor William II and the successive German chancellors, and the decision as to the next major German move was his to make. A victory was needed to bolster Germany's prestige among her allies; moreover, the Americans were arriving in increasing numbers and would make their strength felt by summer. Ludendorff concluded that decisive action was mandatory on the western front in the spring of 1918, and plans were prepared accordingly. Troop transfers from the eastern front gave him a 10 percent advantage in combat personnel in the west, but he lacked reserve strength, since the reservoir of German youth had been almost drained by heavy demands in previous years. This deficiency made it imperative that the initial attack be decisive, for if its impetus were retarded, there would be little left to engage. Ludendorff, however, was confident of the effectiveness of his numerical superiority and of the success of new German offensive tactics.

Three areas were considered for the offensive: Verdun, Flanders, and the Somme. The Verdun area was rejected because of the difficult terrain and the lack of a major strategic objective. The Flanders area was the best, for a breakthrough there would lead to the channel ports, which were vital to the British on the Continent, but the wet ground in the area precluded an attack before April. While there was no critical terrain feature in the Somme area, a breakthrough to the sea would separate the French and British and would crowd the latter into a pocket in which they might later be destroyed. Thus the Somme area was chosen of necessity. Since it had been devastated in the 1916 battles, the speed of the German advance would be reduced; on the other hand, it was the most lightly held sector of the three considered. Ludendorff selected the British as his primary target because he believed that the defeat of Britain would bring a favorable peace. Moreover, he considered the French troops the more skillful (if less tenacious) in defensive operations, and the expert French artillery was much to be feared. His staff had urged two limited offensives at different points to throw the Allies off balance, but Ludendorff, experienced only in successful single crushing offensives on the eastern front, decided that he had enough troops and guns for only one major offensive. To deceive the Allies and to facilitate other attacks if these should be found desirable, however, preliminary

preparations, such as the stockpiling of ammunition, were begun at two places in Flanders: opposite the Ypres (Ieper) salient, and to the south of it. In addition, simulated preparatory bombardments were planned at other places along the front.

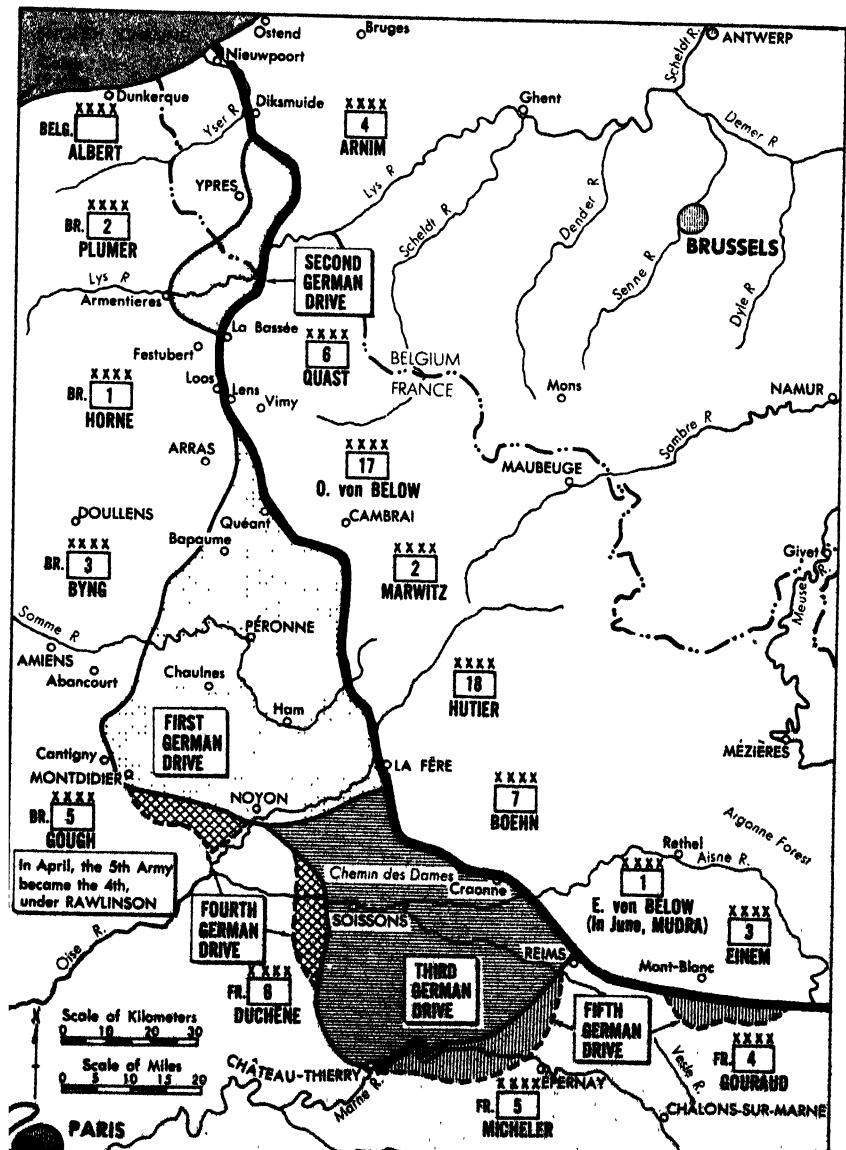

GERMAN DRIVES OF 1918

Though surprise was an essential element in the German scheme, Haig had developed a fair estimate of Ludendorff's plan. Pétain, however, had concluded that the attack would come in his sector, in the Reims area. The British and French each attempted to organize a deep defensive zone, but because of manpower shortages and the negligence of subordinate leaders neither zone was completed in time.

Ludendorff expected to break the deadlock on the western front by the large-scale application of the new Hutier tactics, which had been developed by Gen. Oskar von Hutier and his staff at Riga and had been tested successfully at

Caporetto. These tactics made radical changes in the employment of artillery and infantry. Instead of a lengthy bombardment designed to obliterate the defenses within a limited zone, such as the 19-day shelling in the Third Battle of Ypres in 1917, only a short preparation was fired. It included a high proportion of gas and smoke shells and was designed to put out of action for a short period the enemy gun positions, headquarters, machine guns, observation posts, and trenches. After this preliminary bombardment, the artillery began to fire a rolling barrage that started on the enemy front line and moved forward at a predetermined rate. The rate varied with the terrain and the opposition expected, but was usually one kilometer per hour. The infantry followed the rolling barrage as closely as possible. The advance of each unit was planned in great detail by higher headquarters so as to infiltrate between known hostile centers of resistance. When the barrage reached the limit of its range, full control of the various

GERMAN DRIVES OF 1918. (March 21–July 17, 1918). Russia's collapse enabled the Germans to gain numerical superiority on the western front. It was decided to make a supreme effort to defeat the French and British before the Americans could arrive in sufficient numbers to intervene effectively. Five separate drives were made: in March, April, May, June, and July. Two—the first and third—won spectacular tactical success, but they did not achieve a breakthrough to split the Allies and gain a strategic victory. These tremendous but unsuccessful efforts cost the Germans 800,000 casualties and seriously depressed the morale of the German troops. Exhausted, the Germans were forced to surrender the initiative to the Allies.

units reverted to the regimental and battalion commanders, and the troops advanced as fast and as far as possible in a given general direction, no objectives being specified. When strong resistance was met, leading units bypassed it and moved speedily ahead, disregarding the security of their flanks and leaving the reduction of resistance to follow-up units. Each assault battalion had its own light artillery; infantry troops were formed into small battle groups, each of which was built around the light machine gun (formerly the bulwark of defense but now considered by the Germans the principal infantry weapon in the attack).

The new tactics demanded exceptional standards of training and physical fitness, especially on the part of the infantry. The operations at Riga and Caporetto had been conducted on a moderate scale against enemies of low morale; the contemplated Somme operations were to be on a gigantic scale and would require dozens of highly effective shock divisions. These were pulled out of the line early, filled with selected men at the expense of the other divisions, and extensively trained. Since the Germans had few tanks, this weapon was to play little part in the attack, but special air units were formed to provide low-level bombing and strafing in support of the ground attack.

First German Drive (Somme Offensive), March 21–April 4.—The plan for the Somme offensive was simple. Three German armies were to break the British front from Arras to La Fère: the Seventeenth Army, under Gen. Otto von Below, in the north; the Second Army, under Gen. Georg von der Marwitz, in the center; and the Eighteenth Army, under Hutier, in the south. The Second and Seventeenth armies belonged to the army group commanded by Crown Prince Rupert of Bavaria; the Eighteenth Army, to that of German Crown Prince William. Ludendorff engaged these units of two army groups so that he could exert greater over-all control and ensure that the resources of both groups would be used to the maximum extent. Initially, the three

armies were to advance straight ahead on their respective fronts: the Seventeenth to Bapaume, then northward toward Arras; the Second to Péronne, then northwestward to Doullens; and the Eighteenth to the Somme River, where it would protect the south flank of the general offensive against probable French counterattacks. The ultimate object of the attacks was to separate the British from the French and drive them to the sea.

Haig was expecting a strong attack on the front of his Fifth Army, commanded by Lt. Gen. Sir Hubert de la Poer Gough, late in March. Gough's 15 divisions were deployed sparsely to cover a 41-mile front. The southern 14 miles of his front had recently been transferred by the French through political machinations. Not only was his army overextended, but the area turned over by the French had been organized for defense in a manner different from the British system and was not suited to British defensive tactics. The Third British Army, consisting of 14 divisions and commanded by Gen. Sir Julian H. G. Byng (later 1st Viscount Byng), held the northern sector. These 29 British divisions on the line had the task of stemming the assaults of 71 German divisions—Below, 25; Marwitz, 21; and Hutier, 25. In addition, the German divisions individually were stronger than those of the British. While Haig had expected the German attack, he and the other Allied commanders were completely surprised by its power, ferocity, and tactics.

At 4:40 A.M. on March 21, German artillery (6,000 cannons and 3,000 mortars) began a five-and-one-half-hour bombardment with gas, smoke, and high-explosive shells. At 9:40 A.M., 32 German divisions, followed closely by 28 additional divisions, began the attack in a dense fog. This fog did not hamper the German artillery, which was firing by map, but it affected British defensive fires, especially those of the infantry. During the first day the British front was shattered throughout the zone of attack. By the evening of the second day (March 22), the entire Fifth Army had been forced from its battle position; on the following day, Gough ordered it to retire behind the Somme. Byng's Third Army had lost part of its front line, but since it was defending a deep zone, it was able to hold the German Seventeenth and Second armies to moderate gains. Ludendorff had expected these two armies to make rapid progress while Hutier's Eighteenth Army guarded their south flank. Now he changed his plan to capitalize on Hutier's unexpected success. His armies were directed to drive along both banks of the Somme to the sea, fanning out north and south to strike both the French and the British. He reasoned correctly that the primary concern of the French would be the defense of Paris and that of the British the safety of the Channel ports, and that these divergent interests would prevent cooperation between the Allied forces.

On March 23 and 24, the German advance continued with great speed, particularly in the Fifth Army sector. Gough's rapid retreat exposed the south flank of Byng's Third Army, but the gap was soon filled by British cavalry. By March 26, Amiens, the major link between the British and French, was in peril. These successes caused Ludendorff to expand his plan again by driving northward, first striking Arras; 20 German divisions were thrown toward the

Troops leave their trenches as an attack begins in the last series of German drives on the western front.

French soldiers advance through a desolate stretch of no man's land on the Somme front with the aid of a gas attack.

town, using the new tactics that had created the initial breakthrough. A number of divisions had to be employed that were not well trained in these tactics, however, and this time there were no fog and no surprise. Byng's army now included some of the best British units, and it was posed in an excellent position. The German attack toward Arras was completely repulsed without denting the British line.

Meanwhile, Hutier continued his advance south of the Somme, while French units arrived in dribbles to help Gough, who was fighting a good delaying action. On March 25, Gen. Émile Fayolle assumed command of the mixed French and British units south of the river. By this time, 6 French divisions had arrived, but as Hutier advanced, they tended to fall back to the southwest as if to cover Paris. And this might well have been Pétain's reason for sending even this weak assistance, for he still was convinced that the Germans were about to attack his front between Soissons and Reims and kept most of his reserves disposed to meet such an offensive. On March 27, Hutier captured Montdidier, but his divisions were becoming exhausted, and supplies were not reaching the troops. In the center, Marwitz drove toward Amiens, but he was met near Abancourt by a hastily improvised force of rear area service troops (which included two companies of American engineers) designated as Carey's Force after its commander, Brig. Gen. George Glas Sandeman Carey. For three days (March 28-30), the Germans repeatedly assaulted the old trenches in which Carey had posted his modest force, but to no avail. Ludendorff made two other futile attacks—one on March 30, between Montdidier and Noyon; and the second on April 4, near Albert—and then stopped the offensive.

The first German drive was a brilliant tactical success, having achieved an advance of about 40 miles in eight days. The Germans captured 70,000 prisoners and 1,100 guns and inflicted nearly 200,000 casualties. In a strategic sense, however, the drive was a failure. The British armies had not been destroyed or separated from the French. German manpower losses approximately equaled those of the Allies, but most of their losses had been sustained by the highly trained shock divisions. Moreover, the losses could not be replaced, whereas American

troops were arriving at an accelerated pace to join the Allies on the western front.

Allied Unity of Command.—One important result of the first German drive was that it forced the Allies to adopt a system of unified command. The Italian disaster at Caporetto had made it clear that better coordination of the Allied effort was essential, and the Supreme War Council had been formed in November 1917. Lloyd George and Premier Georges Clemenceau wished to give the council control of a general reserve of 30 divisions, but Haig contended that he could not spare his quota. Instead, he devised with Pétain an arrangement for mutual assistance if necessary. "I can deal with a man but not with a committee," said Haig. The arrangement failed in the acid test of the first German drive. As the Germans pressed forward, Haig called on Pétain for help; Pétain agreed to send a few divisions. Haig wanted more, but the French commander refused because he expected a German attack near Reims. Furthermore, he announced that in the event of a retreat his troops would withdraw to the southwest to cover Paris. This decision alarmed Haig, for such a move would create a large gap between the French and British forces that would invite disaster. He reported to the British secretary of state for war, Viscount Milner, that the Allies would be defeated unless "Foch or some other determined general who would fight" was placed in supreme command of the Allied forces in France.

On March 26, the Allied leaders assembled at Doullens. Clemenceau suggested that Gen. Ferdinand Foch be "charged with the coordination of the action of the British and French armies in front of Amiens." Haig and Pétain called attention to the inadequacies of such an arrangement and urged that Foch be given authority over all the British and French operations on the western front. This course was finally approved as an emergency measure during the crisis; on April 3, Foch was given authority over the American forces as well, and on April 14 he was formally made commander in chief of all the Allied armies in France. Foch thereafter led the Allies to victory, but not so much by legal authority as by military acumen, determination, and force of personality.

Second German Drive (Lys Offensive), April 9-29.—Though his first drive had failed,

Ludendorff hoped that one more blow would shatter the British Expeditionary Force (BEF). The Germans still had reserves which could be used in an attack, and preparations had been made for one near Ypres as a deceptive measure to cover planning for the first drive. These preparations and an excellent rail network would permit a rapid regroupment and an attack in Flanders, although it could not be made on the scale of the Somme offensive. Gen. Sixt von Arnim's Fourth Army was to attack north of Armentières, and Gen. Ferdinand von Quast's Sixth Army south of the town. Only 35 divisions were available for the two attacks, and they were much inferior to those employed in March. There were no cratered fields in the zone to hinder an advance, but the country was cut up by hedges, canals, dikes, and small streams, which would facilitate a British delaying action.

At 8:45 A.M. on April 9, after an intensive bombardment consisting largely of gas shells, 8 divisions of the German Sixth Army struck south of Armentières, where 3 divisions of the First British Army of Gen. Henry Sinclair Horne (later 1st Baron Horne) held the front. The center division was a Portuguese unit that was occupying not only its own sector, but also that of another division, pending relief by 2 British divisions on April 10. The German blow sent the overextended Portuguese fleeing to the rear and crushed the British division on their left. Within three hours, Quast's troops had passed through the entire trench system and were in the open, and by day's end they had advanced five miles. The next day, Arnim's Fourth Army attacked north of Armentières, concentrating 4 divisions against a single British division sector on the front of the Second British Army, commanded by Gen. Sir Herbert C. O. Plumer (later 1st Viscount Plumer). This attack succeeded largely because British reserves had been drawn southward by Quast's attack of the previous day. On April 11, the two German armies joined forces and advanced westward.

By the morning of April 12, the BEF was in extreme danger, and preparations were made for evacuating Calais and for flooding the countryside. Meanwhile, Haig rushed all the reinforcements he could find to the scene and pleaded with Foch for more. The supreme commander had been trying to scrape together reserves for a major Allied counterattack. Since the First Battle of Ypres, Foch had admired and developed great confidence in the British soldier's tenacity on the defensive. Despite Haig's angry protests, he therefore sent only relatively small forces. His faith in the British soldier was vindicated, for in some of the most heroic fighting of the war the British, with the help of such French troops as Foch sent, stopped the German offensive.

Ludendorff had again achieved a brilliant tactical success and a strategic failure. The drive had cost him 350,000 men to acquire a vulnerable salient; the British lost 305,000 men. The German commander now scraped the eastern front for men, while American reinforcements more than compensated for the Allied losses.

Third German Drive (Aisne Offensive), May 27–June 6.—Ludendorff believed that the British were overstrained, and that one additional heavy blow would defeat them. Accordingly, preparations were made for two new attacks in Flanders. Appreciating the fact that

the French and British reserves then in that area could probably stop the attacks of his depleted forces, however, he decided to make a thrust elsewhere to draw the reserves away before launching the two attacks. The area selected for the diversionary attack was the *Chemin des Dames*, a highway along the Aisne between Soissons and Reims. This was precisely the area in which Pétain had feared an attack in March. None having come, it was presumed that the Germans considered the position impregnable, and the garrison had been severely reduced. Since Foch considered the junction between the French and British in the Amiens area the critical point in the Allied line, most of his reserves were posted there. Knowing that the Allies were alert for another attack, the Germans prepared the Aisne offensive with the greatest secrecy. Two weeks before the actual attack, the American intelligence service had predicted its location, but the prediction was ignored by Foch and Pétain. On May 26, definite information was obtained from two German prisoners that the attack would take place on the following day. It was then too late to do more than alert the Allied front-line units. While 8 Allied divisions were started down from the north, they could not arrive in time.

On the morning of May 27, two German armies—Gen. Fritz von Below's First Army and Col. Gen. Max von Boehn's Seventh Army—attacked with 17 divisions in the line and 13 in the rear. Approximately 4,600 guns supported the offensive. Gen. Denis Auguste Duchêne, who was in charge of this sector of the Allied front, had been loath to relinquish the high ground of the *Chemin des Dames* in the front of his position. To ensure its retention, he had placed most of his infantry in the forward defenses, thereby abandoning a defense in depth. The German attack broke through his defenses and by night had raced 13 miles to Fismes, across the Vesle River. Ludendorff had planned to stop there and begin his offensive in Flanders, but his troops were moving rapidly against little resistance, and he could not withstand the temptation to let the attack run its course. Three days later, the Germans were on the Marne at Château-Thierry, within 37 miles of Paris.

Pétain now asked Gen. (later General of the Armies) John J. Pershing for an American division to hold the Marne crossings. Pershing had been firm in his intention of engaging American troops as a separate army, but the situation was critical, and he assigned the American 3d Division to the task. The division had never been in action and was then 110 miles away in a training area. A hurried movement by rail and motor brought it to Château-Thierry on June 1. For the next three days the Germans strove to cross the Marne, but the Americans threw them back repeatedly and kept them on the north bank of the river. Meanwhile, other German forces advanced west of Château-Thierry on the road to Paris. The American 2d Division was thrown across the road and in bitter hand-to-hand fighting stopped the foe. Ludendorff now halted the German offensive. It was his greatest tactical success on the western front, but its net result was to leave the Germans in a salient more unfavorable than the two formed in the previous drives.

Contigny.—On May 28, the second day of the German Aisne offensive, an operation took place

that was important not so much for its military impact as for its psychological effect. It was the capture of the village of Cantigny by the American 1st Division, the first offensive operation undertaken by an American division in the war. Cantigny stood on high ground, a factor that gave the Germans good observation over the Allied lines and concealed their own rear-area activities. The offensive was a success in every way. To the Germans, who had been scornful of American fighting ability, this success brought great discouragement, but to the formerly skeptical British and French this display of the fighting potential of American troops was a great encouragement.

Fourth German Drive (Noyon-Montdidier Offensive), June 9-13.—After his third drive, Ludendorff found himself in a dilemma. His advance had created a salient that was extremely vulnerable to Allied counterattack. The proper course was to withdraw to a safer military position, but such a move would adversely affect the morale of the German troops and the home front and, simultaneously, would bring joy to the Allied countries. Yet if he did not withdraw from the salient, he would not have enough troops for his Flanders offensive, for which the third drive had been undertaken as a diversionary operation. It was imperative that he not surrender the initiative to the Allies, and he therefore decided on a smaller two-pronged offensive. One thrust would drive southward from the Noyon-Montdidier sector; the other, westward from Soissons. His purpose was to extend the front forward between the Amiens and Aisne salients in order to facilitate supply operations and to threaten Paris. Again he hoped that the threat to Paris would draw reserves from Flanders so that he could undertake his ultimate object: the destruction of the British in that area. On June 9, Hutier's Eighteenth Army attacked from the Noyon-Montdidier sector and Boehn's Seventh Army from Soissons. This time there was no surprise, and the French under Fayolle were well prepared. They had adopted a deep-zone defense against which the German offensive gradually wore itself out. After a tortuous advance of 9 miles the Germans were stopped by French counterattacks. Fighting ceased on June 13. For unimportant gains the Germans had suffered heavy losses, while French losses were light.

Fifth German Drive (Champagne-Marne Offensive), July 15-17.—A month of comparative quiet followed the fourth drive. Many German leaders favored making peace overtures, but Ludendorff was resolute. Nonetheless, German troops had shown signs of slackening discipline during the rigors of the Lys offensive. Now, poorly fed and in a weakened condition, they were easy prey for the worldwide influenza epidemic that struck in June. Between 1,000 and 2,000 men in each division had developed the disease. Allied propaganda leaflets, designed to alienate the troops and the people from their leaders, were sent across the lines by balloons. United States troops were arriving in such numbers that, for the first time in 1918, Allied infantry strength on the western front exceeded that of the Germans. Foch was busy assembling forces and preparing for his counteroffensive.

Despite the unfavorable situation, Ludendorff strove to retain the initiative and to gain final victory by two great attacks. One was to cap-

ture Reims; the other, on a much larger scale, was to take place 10 days later in Flanders (this was his final plan to destroy the BEF, which was never to be carried out). In the Reims offensive, Boehn's Seventh Army was to attack southeastward from the Marne salient toward Epemay; Gen. Bruno von Mudra's First Army was to attack southward to capture Châlons-sur-Marne; and, to the east, Col. Gen. Karl von Einem's Third Army was to attack to cover the flank of the First Army. In this stroke, 52 German divisions were to be employed; 36 Allied divisions confronted them—23 French, 9 American, 2 British, and 2 Italian.

Through aerial photography and German deserters (the last drives had been signaled by a marked increase in the number of German deserters on the eves of the offensives), Foch learned of the German plans in detail and took proper countermeasures. He anticipated the German preliminary bombardment with one of his own, which caught the Germans in close formations and inflicted severe losses. The Seventh Army attack toward Epemay was frustrated; that of the First Army gained initial successes, but was finally stopped by a heroic Allied defense. The psychological impact of this setback on the German troops was great. Ludendorff had designed the operations as a diversion to draw Allied reserves from Flanders, but the German troops had called it *Friedensturm* (peace offensive) and had expected it to produce decisive results. This was the last offensive Ludendorff could launch, for Foch had now gained the initiative. During the five drives the Germans lost more than 800,000 men.

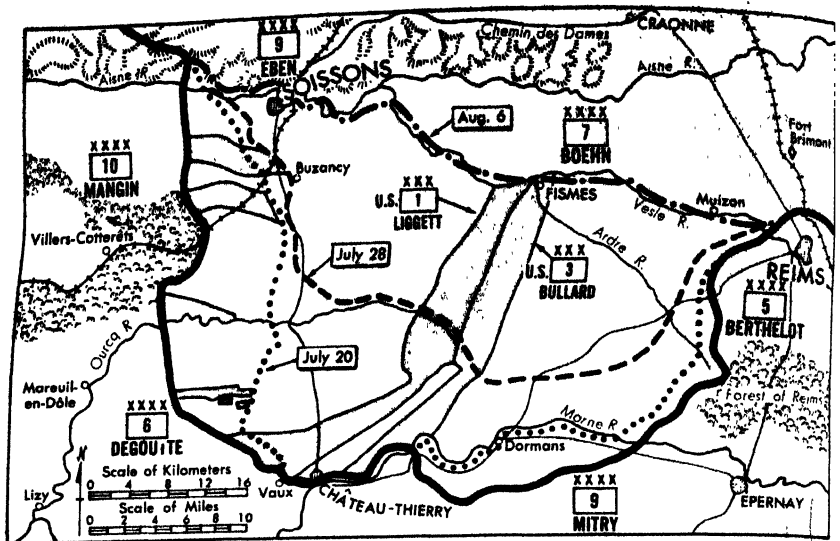

REDUCTION OF THE GERMAN SALIENTS

Aisne-Marne Offensive, July 18-August 6.—As early as May 20, Foch had planned a counteroffensive to seize the initiative from Germany. His opportunity came with the failure of the fifth German drive. In preparation for a general offensive, he planned to reduce the three prominent German salients so as to improve lateral railway communications along the Allied front and facilitate future operations. The three salients were the Marne salient, created during the third German drive; the Amiens salient, formed during the first German drive; and the St.-Mihiel salient, formed in the autumn of 1914 and relatively quiet ever since. Foch's first objective was the Marne salient, although it was difficult to assemble promptly the means for an offensive there. Haig was called on to provide some of his reserves and responded generously despite the objections of the British cabinet, which was fearful of reducing British strength in Flanders to a dangerous level.

Foch's plan was to attack the Marne salient from all sides. Four French armies were to engage in the offensive; in counterclockwise order these were Gen. Charles Mangin's Tenth and Gen. Jean M. J. Degoutte's Sixth armies, in the western half of the salient; and Gen. Marie Antoine Henry de Mitry's Ninth and Gen. Henri M. Berthelot's Fifth armies, in the eastern half. Included in these armies were 8 American, 4 British, and 2 Italian divisions. Mangin was to make the main assault. Early on July 18, he struck with 20 divisions (including 2 American

¹ This offensive and the Champagne-Marne offensive of July 15-17 together are often referred to as the Second Battle of the Marne.

REDUCTION OF THE MARNE SALIENT (Aisne-Marne offensive; July 18-Aug. 6, 1918). Gen. (later Marshal) Ferdinand Foch planned to launch a general offensive as soon as the German drives had spent themselves. First, however, it was necessary to reduce several salients occupied by the Germans which restricted Allied lateral communications along the front. The Marne salient, created during the third German drive, was attacked by Allied forces, predominately French, from three sides in July. In a brilliant operation the Allies forced the Germans back to the Vesle and Aisne rivers, thus straightening the front.

and 2 British) and 350 tanks. An hour later, Degoutte joined the attack on Mangin's south flank, and by nightfall the Tenth and Sixth armies had advanced from 2 to 5 miles. (This was the greatest and most successful use of tanks by the French during the war.) On July 19, Mangin continued to advance toward Soissons and the Soissons-Château-Thierry road, the vital artery of the German salient, although more difficult terrain and mechanical failures were beginning to render the tanks less effective. Modest gains were made by the other French armies on this day.

Alarmed by Mangin's threat against the key communications center of Soissons, the Germans decided to withdraw from the Marne salient. The withdrawal was conducted skillfully and in good order. The Germans delayed at successive positions, defending each resolutely while evacuating supplies and equipment to the rear, until the pressure of the Allied attacks compelled them to retreat. By August 3, they had withdrawn to a strong position at the base of the salient behind the Vesle and Aisne rivers, where they held fast. On the morning of August 6, 2 American divisions attacked this position. Minor gains were scored, but it was not broken. The Marne salient had been eliminated; the French had gained a glorious victory, but they did not forget to express their gratitude for the help of their British and American allies. This, the first significant Allied success of the year, brought relief in the Allied homelands; Paris was jubilant. On August 6, Foch received his baton as a marshal of France.

The largest American contingent thus far had participated in the operation. For the first time, American divisions were formed into corps. Near the end of the battle the American 1st and 3d corps held the entire front of the French Sixth Army. American divisions had been used as spearheads in the offensive and had performed in a manner to gain praise from their allies. A total of 8 American divisions had been engaged in the offensive, but the number does not indicate the true magnitude of American participation. Each division, comprising 28,000 men, had twice the infantry strength of a British, French, or German division. The organization of the

American division has been criticized by many (including Americans), but its huge size did give it integral power for sustained operations, thereby necessitating fewer shifts of divisions between front and rear—a distinct advantage in the warfare of the times in France.

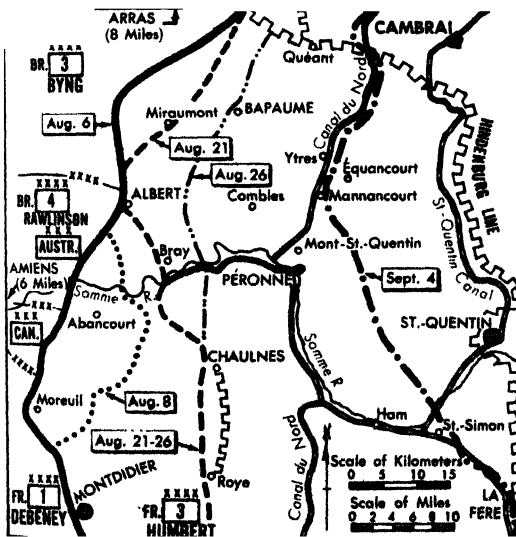

German losses in the Aisne-Marne offensive were heavy but not ruinous. What was more important, the initiative had now passed to the Allies, where it would remain until the end of the war. Ludendorff's cherished Flanders offensive had become a dream, and it was clear that his hope of crushing the Allies before the United States could put a large force in the field would not be realized.

Reduction of the Amiens Salient, August 8-September 3.—In mid-July, plans were developed for operations against the Germans in the Amiens salient, and preparations were begun. The main attack was to be made almost directly eastward from Amiens by the Fourth British Army of Gen. Sir Henry Seymour Rawlinson (later 1st Baron Rawlinson); assisted on the right by Gen. Marie Eugène Debeney's First French Army. Gen. Georges Louis Humbert's Third French Army was to exert pressure against the southern face of the salient. Rawlinson amassed on a 10-mile front a powerful striking force: 17 infantry divisions (including 1 American division and two of the best fighting corps on the western front—the Canadian Corps of 4 divisions and the Australian Corps of 5 divisions); 3 cavalry divisions; about 600 tanks, the majority of which were of a new and much-improved type; 2,000 guns; and 800 fighter and bomber aircraft. Debeney had 10 divisions but few tanks; he was to be supported by 1,100 aircraft. To oppose this avalanche the Germans had two armies—Marwitz's Second and Hutier's Eighteenth—totaling 20 divisions, mostly of dubious quality, supported by few tanks and less than 400 aircraft.

Because of the disparity in numbers of tanks, the attacks of the British Fourth and the French First armies were to differ. Rawlinson was to use the tactics which had proved so successful at Cambrai in November 1917. There the tanks followed by the infantry had advanced under the cover of a rolling barrage. Since surprise was essential in this type of attack, no artillery

was to be used. Debeney, lacking tanks, had to attack conventionally. His offensive was to be delayed about an hour in order to allow for artillery preparation and yet not jeopardize the surprise of the British attack.

At 4:20 A.M. on August 8, the British Fourth Army struck in a helpful mist, and Debeney joined in the attack at the appointed time. Although Ludendorff had taken special precautions to strengthen this important part of the front, it now collapsed. The German infantry could not stand up against the British tanks, and 6 divisions, considered battleworthy by Ludendorff, gave way at once. It was not the effectiveness of fire from the tanks that demoralized the Germans (this was wobbly and erratic), but the inexorable advance of the steel monsters against infantrymen who had no defense against them. (Advancing against artillery fire, tanks usually suffered about 25 percent casualties a day in an attack.) Within two hours the British had taken 16,000 prisoners and 200 guns; by noon tanks and armored cars, as well as cavalry, were 9 miles to the rear of the German lines. Debeney's advance had not been as spectacular as that of the British, but it progressed successfully. This great Allied victory caused Ludendorff to call Aug. 8, 1918, the "black day" of the German Army, since for the first time entire units collapsed. Retreating troops called out to reinforcements marching toward the front: "You're prolonging the war."

REDUCTION OF THE AMIENS SALIENT (Aug. 8-Sept. 3, 1918). The Amiens salient was created during the first German drive. In August, Allied forces, predominately British, strongly supported by tanks, forced the Germans to give way and drove them back to the Hindenburg Line, from which they had started their first drive in March.

By August 10, the Canadian and Australian corps and the Cavalry Corps had advanced 12 miles and were close to the strong German Roye-Chaulnes position. The French First Army was rapidly catching up, and Humbert's Third Army was successfully driving northward. Foch urged Haig to exploit these successes and drive straight east to the Somme, but Haig insisted that the Roye-Chaulnes position was too strong to be broken without extensive preparations, including

the moving up of heavy artillery. Instead, he wanted to suspend the attack and to open a new one with Byng's Third British Army on the north flank of Rawlinson's Fourth Army. Foch finally agreed to this plan, and Haig shifted his reserves to the north for the new drive, which was to be opened on August 21. The Germans conducted a zone defense before Byng's attack, falling back 3 miles to their main position. From there they counterattacked on August 22. The crafty Haig had foreseen this maneuver, however, and had engaged only part of his force on the first day. Hence he was able to beat off the counterattack and maintain his momentum. On August 23, he ordered a general advance along a 30-mile front. The increasing pressure in the north caused the Germans to evacuate the Roye-Chaulnes position, as Haig had predicted. In brilliant operations the Australians captured the dominating heights of Mont-St.-Quentin on August 30-31, and two days later the Canadians broke the elaborate German switch position east of Arras. The Germans then withdrew to the Hindenburg Line, whence they had started their first drive five months earlier. The Amiens salient had been wiped out.

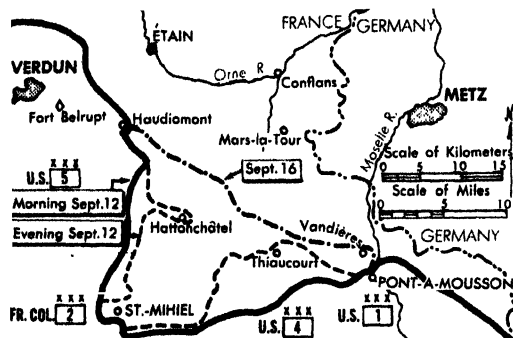

The mounting German disasters brought on during August a crown council at which governmental and military leaders discussed their future actions. Ludendorff offered his resignation, but it was refused. The decision was made to fall back fighting and to maintain a foothold in France as long as possible. Peace negotiations were to be opened through the mediation of neutrals, but, as it turned out, little was done for some time.

St.-Mihiel Offensive, September 12-16.—By early July, 25 United States divisions were in France; of these, 12 were trained and had engaged in or were ready for combat. On July 24, General Pershing ordered the formation of Headquarters, United States First Army, with himself as commander, to be effective on August 10. It had been planned to have this headquarters assume control of the 1st and 3d American corps, then engaged on the Vesle. When the situation was stabilized there, Pershing obtained Foch's permission to take over the St.-Mihiel sector instead, leaving 3 or 4 divisions on the Vesle under French command.

The St.-Mihiel salient hampered rail communications between Paris and Lorraine, and its reduction was necessary before Foch's final offensive could be undertaken. In addition, it was important to the Germans, since it covered Metz and the Briey iron mines; and for these reasons this naturally strong position had been carefully fortified. The severe fighting earlier in 1918 had made great inroads in the Germans' manpower, however, and had forced them to economize wherever possible. To further this purpose a step-by-step withdrawal from the St.-Mihiel salient had already been ordered, and the removal of heavy materials and some relatively immobile artillery pieces had begun on September 11, the day before the American attack.

By the end of August, Pershing had nearly completed his plans and preparations for the St.-Mihiel offensive. Now Foch, elated by the success of the Aisne-Marne and Amiens offensives, planned to reduce the scope of the St.-Mihiel offensive and to divide the American forces into three groups to operate in different

areas. A heated controversy ensued between Foch and Pershing. The latter saw the advantage of pressing the enemy and of giving him no respite, as Foch proposed, but he saw no valid reason for splitting his own forces. When Foch insisted, Pershing remained adamant, replying, "While our army will fight wherever you may decide, it will not fight except as an independent American army." Finally, a compromise was reached: the United States First Army would remain intact, the objective of the St.-Mihiel attack would be limited to capturing the base of the salient, and the First Army would then take over the Meuse-Argonne sector as its major role in the final offensive.

REDUCTION OF THE ST.-MIHIEL SALIENT (St.-Mihiel offensive; Sept. 12-16, 1918). The St.-Mihiel salient was created during the initial German offensive in 1914 and had been practically dormant ever since. The task of reducing the salient was given to the American First Army (with one French corps attached) as its first operation as an independent army. Appreciating their vulnerability in this exposed salient, the Germans had begun to evacuate heavy equipment and materials before the attack was launched. German resistance to the American attack was not determined, and the salient was reduced in four days.

The plan for the St.-Mihiel offensive provided for attacks by three American corps (1st, 4th, and 5th) on the flanks of the salient, while the 2d French Colonial Corps drove against its nose. As an army, the United States First Army was decidedly unbalanced. During the dark days of the early German drives, the British and French had pleaded for American infantry and machine-gun units to fill their most pressing needs. Priority had accordingly been given to the shipment overseas of these types of units. Now the First Army found that it was dependent on the British and French for heavy support. This was cordially given: most of the 3,000 guns to support the attack were provided by the French; the 267 light tanks to be employed also were French, some being manned by French crews and some by American; and the air force of 609 American planes was increased to nearly 1,500 by the attachment of French, British, Italian, and Portuguese units.

The battle opened at 1 A.M. on September 12 with an intensive artillery preparation, and at 5 A.M. the infantry jumped off. Resistance was generally light, and by day's end most of the American units had reached their second-day objectives. By evening of September 13, all objectives had been taken, and the salient had been reduced. A much greater advance could probably have been made, but since Pershing was committed to the impending Meuse-Argonne

operations, the St.-Mihiel attacks had to be halted. French units began relieving the American divisions so that the latter could be moved immediately to the Meuse-Argonne area.

The St.-Mihiel operation was a well-executed limited offensive. It was not a hard fight, but American commanders and their staffs there displayed their competence to handle a large operation, as American troops had proved their fighting qualities in the Aisne-Marne offensive.

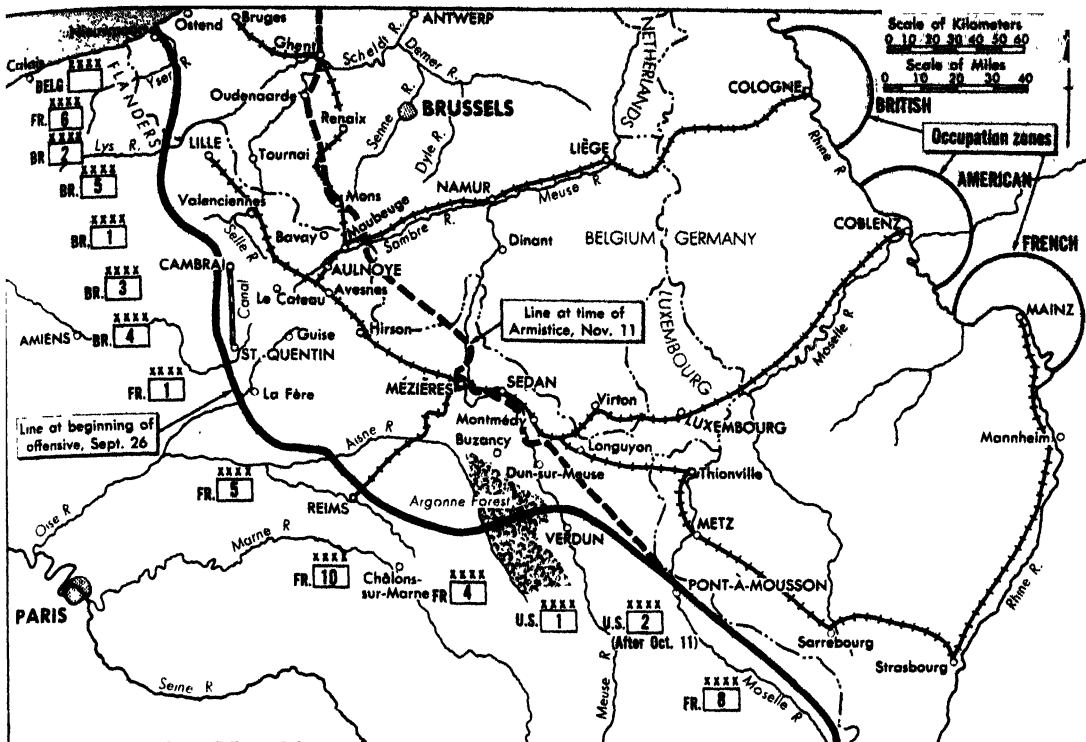

ALLIED FINAL OFFENSIVE

Foch's Plan.—Since June, Foch had been contemplating a general offensive in September, but he apparently did not believe that such an offensive would be decisive at that time, for he continued to urge the British and Americans to strengthen their forces for a decisive effort in 1919. Nevertheless, the Aisne-Marne and Amiens victories had clearly demonstrated the superiority of the Allied armies. To Foch this ascendancy seemed to justify an attempt to gain the victory in 1918. The British cabinet was reluctant to permit Haig to engage in such an enterprise, believing that the final drives could not be made before 1919, but the general went to London and persuaded the cabinet to accept Foch's view.

Foch realized that his offensive could be frustrated by a rapid withdrawal of the Germans to the frontiers, combined with the thorough demolition of roads and railways in their wake. Such a retreat would compel the Allies to build new communications as they advanced, and it would probably be impossible for them to make a major coordinated attack against the German frontiers before the spring of 1919. A rapid German withdrawal would necessitate the abandonment of vast stores of supplies and equipment that had been built up in France and Belgium, however, and the German General Staff could not reconcile itself to this sacrifice. Understanding all of these factors, Foch is said to have remarked: "The man could still escape if he did not mind leaving his luggage behind." The key-stone of Foch's offensive plan accordingly became the prevention of an orderly, step-by-step evacuation by the Germans.

The German armies depended for supply (and would have to depend for evacuation) primarily on the railroad running from Cologne through Liège, Namur, and Maubeuge. Another line ran from Coblenz up the Moselle Valley to Luxembourg and Virton, and a third ran southward along the west bank of the Rhine River to Strasbourg and thence northwestward to Metz. The great lateral railroad was the Bruges-Ghent-Maubeuge-Mézières-Metz—line, from which branches ran to the fighting front. The key rail junctions were Aulnoye and Mézières, and the loss of these places would deprive the Germans of their principal capabilities for withdrawal. Foch's general plan, then, was to capture both junctions rapidly by means of two major converging offensives. One offensive, mainly British, was to drive eastward to Aulnoye; the other, mainly American, was to drive northward to Mézières and Sedan.

For his final offensive, Foch had 220 divisions: 102 French, 60 British, 42 American, 12 Belgian, 2 Italian, and 2 Portuguese. Besides having twice as many infantry troops as the other divisions, the American divisions were at full strength, while the other Allied divisions were below strength. On the line were 160 divisions

ALLIED FINAL OFFENSIVE (Sept. 26–Nov. 11, 1918). The obstructive salients having been reduced, Foch launched his general offensive on September 26. His objective was to capture the key rail junctions of Aulnoye and Mézières, thus preventing an orderly withdrawal by the Germans and leaving them vulnerable to destruction. To execute the plan, a Franco-British pincer was to advance rapidly to Aulnoye from the west, and a Franco-American pincer to Mézières from the south. The Germans prevented the pincers from closing and withdrew in fair order, though suffering heavy losses. Recognizing the hopelessness of their cause against the massive and relentless Allied offensive, the Germans asked for an armistice. It was granted, effective November 11.

60 were held in reserve. To oppose the Allied offensive the Germans had 197 divisions: 113 in line and 84 in reserve. Only 51 of these divisions were classified by the Allies as effective fighting units, however, and all were under strength. News from a disillusioned home front further depressed the already low morale of the German troops. Ludendorff braced his forces as best he could for the impending blows. Special counterattack divisions, composed of selected men and better armed and equipped than the other divisions, were kept in reserve to counter any Allied breakthrough.

Though Foch intended a sort of pincers operation with a British-French pincer moving from the west and an American-French pincer moving from the south, his plan provided for aggressive action by all of the 160 front-line divisions. *"Tout le monde à la bataille"* ("Everyone in the fight") was his expressive description of the offensive. Fully aware of the scarcity of the German reserves, he planned to stagger his attacks in order to confuse the enemy and keep him off balance. Should the German reserves be directed to counter one Allied attack, subsequent attacks elsewhere might find easy going. Foch had employed this scheme of staggered attacks in the Aisne-Marne offensive with excellent results.

The offensive was to be initiated on September 26 by the southern pincer (the American First Army, with the French Fourth Army on its left), with Mézières-Sedan as its objective. The western pincer would begin its attack toward

Aulnoye on September 27 with the British First and Third armies. The British Fourth and French First armies, to the south, would join the attack on September 29, with the French First Army on the right. The French Fifth and Tenth armies were to advance in the center between the French First and Fourth armies in order to maintain pressure on that front and prevent the movement of German troops to other sectors. It was hoped also that these troops would be trapped by the converging pincers. In the Flanders area three armies—the Belgian, French Sixth, and British Second—under King Albert I would attack toward Ghent on September 28. The British Fifth Army was to cover the gap between King Albert's and Haig's army groups. The remainder of the western front, south of the American First Army, was held by Gen. Édouard de Currières de Castelnau's French army group, with the French Eighth Army adjacent to the Americans. Castelnau's forces were to play only a defensive role in the offensive.

The grouping of forces for the final offensive indicates the degree of mutual confidence and cooperation among the Allies under Foch. French troops served enthusiastically under British, Belgian, and American command; British, under French and Belgian command; and Americans (8 divisions), under French and British command. In fact, there was greater harmony among commanders of different nationalities than among those of the same.

For simplicity and continuity in tracing the

complex operations of the many Allied armies, they are classified here into four groupings. From north to south these are the Flanders offensive, the western pincer (Cambrai-St.-Quentin), the operations of the French center, and the southern pincer (Meuse-Argonne). The operations are further divided into two time periods: September 26–October 31, and November 1–11.

Operations, September 26–October 31.—Southern Pincer (Meuse-Argonne).—The mission of the American First Army, as stated by Foch, was to drive the enemy behind the Sedan-Mézières rail line before winter weather made offensive operations difficult. The French Fourth Army would attack on the American left. Both armies would effect a junction north of Grandpré, at the northern end of the Argonne Forest. Before the offensive could be launched, 220,000 men of the French Second Army had to be moved from the Meuse-Argonne sector, while 600,000 American troops moved in from the St.-Mihiel front and from the rear. Through remarkable staff work the move was accomplished smoothly and expeditiously. Because of the short interval between the end of the St.-Mihiel offensive and the contemplated final drive, however, most of the experienced American divisions could not be brought up in time to lead the Meuse-Argonne attack. Consequently, of the 9 divisions that were to take part in the initial attack, 5 had not been previously engaged in combat and 4 did not have their own artillery.

An advance in the Meuse-Argonne sector posed a serious threat to the entire German position on the western front. The Germans therefore had carefully fortified the zone during the four years they had occupied it. Three main lines of defense had been thoroughly organized, and almost every wood and village between them had been fortified as a strong point. In addition, every possible route of advance was

covered by Germans on dominating ridges, and the rugged and thickly wooded hills of the Argonne Forest themselves provided strong obstacles.

At 5:25 A.M. on September 26, after a preliminary bombardment, Gen. Henri J. E. Gouraud's Fourth French Army advanced, and five minutes later Pershing's American First Army moved forward. The French advance was hampered by mine craters and shell holes, which had been created during the operations of previous years, and by strong German positions on the commanding heights. It had progressed only 3 miles by the evening of September 27; by October 1, after three days of bitter fighting, Gouraud had advanced 6 additional miles; by October 9, his offensive had gained only another mile and a half. Meanwhile, the American assault on September 26 had encountered only 4 German divisions on the front line. By evening the surprised Germans had been beaten back 5 miles along the Meuse but only 2 miles in the difficult Argonne Forest. The advance continued until October 1, but meanwhile German resistance had stiffened. Although the first two German positions had been broken, the American effort spent itself before reaching the third position. After the relief of units and reorganization the attacks were resumed on October 4.

The next four weeks saw a grueling series of frontal attacks, during which the Americans beat their way through the third German defensive position as casualties mounted rapidly. Meanwhile, Pershing launched an offensive across the Meuse to clear the heights on the east bank. This sector was turned over to the newly formed American Second Army, under Lt. Gen. Robert L. Bullard. Lt. Gen. Hunter Liggett was given command of the First Army, and Pershing thereafter acted as army group commander. By October 31, the Argonne Forest had been cleared, and the Americans had advanced 10 miles beyond their starting line of September 26. Gouraud's Fourth Army had broken through the desolated area on its front into open ground and by October 31 had reached the Aisne River, 20 miles from its starting points.

The slow though steady progress of the American First Army during this phase of the battle was highly unsatisfactory to Clemenceau, who suggested to Foch that he try to have Pershing relieved of command. Foch, however, had "a more comprehensive knowledge of the difficulties encountered by the American Army," and declined to support such action. As a matter of fact, the American First Army was accomplishing far more than its limited territorial gains indicated. The threat of its slow but persistent advance had alarmed Ludendorff, who eventually sent 27 of his precious reserve divisions to the American front, thereby facilitating the progress of the other Allied offensives.

Western Pincer (Cambrai-St.-Quentin).—Four Allied armies were poised to move eastward on the Cambrai-St.-Quentin front. From north to south these were the British First (Horne), Third (Byng), and Fourth (Rawlinson) armies and the French First Army (Debeney). The British First and Third armies were to attack on September 27, one day after the attack of the southern pincer; the Fourth and French First armies would move out on September 29, in consonance with Foch's plan of staggered attacks. Between Haig's armies and their objective, Aulnoye, lay

Troops of the American First Army in Varennes, taken as the Meuse-Argonne offensive begins on Sept. 26, 1918.

U. S. Signal Corps

canals, rivers, and German defensive positions, including in the southern sector the formidable Hindenburg Line with its three deep defensive positions. At dawn on September 27, the British First and Third armies began their offensive without preliminary bombardment in order to gain surprise. The attacks progressed according to plan but not as rapidly as had been anticipated; by the night of September 28, they had broken through the German defenses to a depth of 6 miles. This success, plus the American early successes on the Meuse-Argonne front, convinced Ludendorff of eventual German defeat. On the night of September 28, he reported to Field Marshal Paul von Hindenburg that there was no chance of an improvement in the German situation, and that efforts to obtain an armistice should be begun. The following day, Hindenburg reported to his government that "the situation demands an immediate armistice in order to avert a catastrophe." On October 4, German and Austrian notes proposing an armistice were forwarded to President Woodrow Wilson.

Meanwhile, on the morning of September 29, Rawlinson's Fourth Army joined the attack, with Debeney's First French Army advancing on its right as flank protection. An intensive bombardment had been started on the night of September 27 along the Fourth Army's front, and it had been continued through the night of September 28. This lengthy bombardment was necessary because the attack had to be made across the St.-Quentin Canal, and tanks could not precede the infantry in the assault. Artillery had to be employed to

soften the German defenses, preparatory to forcing the canal. The effect of this sustained bombardment was to drive the Germans deep into their shelters and to prevent the delivery of food and ammunition to the front-line troops. Moreover, since most of the German troops on the line were either new conscripts or recent arrivals from the eastern front, the demoralizing effect of the bombardment was great. In a determined attack, British, Australian, and American troops hurled themselves at the tunnel defenses and swam the canal. The ferocity of the attack panicked the Germans, who abandoned their machine guns and positions and fled to the rear. By nightfall the Fourth Army had captured the advanced position of the Hindenburg Line and a good part of the second position. All three British armies were now engaged in a slow but inexorable advance. On September 30, Cambrai was enveloped on the north and south, but the Germans were not cleared from the town until October 9. St.-Quentin was flanked by the Fourth Army, evacuated by the Germans, and occupied by the French First Army on October 1-2. By October 5, the third and last position of the Hindenburg Line was in British hands. With his front giving way, Ludendorff withdrew his forces to a new position along the line of the Selle River. His special counterattack divisions had proved ineffective not only because they were too few in number, but also because the front-line troops in assaulted areas would not hold positions long enough to permit their arrival.

The Allies moved to the line of the Selle, and on October 17 the British Fourth and French

First armies attacked the German positions from Le Cateau southward. The German troops, exhorted by appeals to hold fast in defense of the fatherland, fought well, but after two days of bitter combat they withdrew before the two Allied armies. At 2 A.M. on October 20, the British First and Third armies attacked the northern sector of the Selle position. The infantry crossed the river and, assisted by tanks, assaulted the high ground along the east bank. Again the Germans fought stubbornly, but they were eventually driven off. The three British armies and the French First Army on their right continued the advance through seas of mud, hampered by German mines and demolitions. By the end of October they had reached the next German position, which lay behind the Scheldt River and extended southward to the vicinity of Laon.

Flanders Offensive.—King Albert's army group was to attack on September 28, the day between Haig's assaults of September 27 and 29. The offensive of his three armies (from north to south, the Belgian, French Sixth, and British Second armies) began well despite persistent heavy rains. By October 1, the advance had progressed 8 miles and had succeeded in recapturing the Ypres Ridge. The grave threat of Haig's attack to the south had influenced Ludendorff to send reserves to that area. These were few, and, forced to make a choice, he decided to draw troops from the Flanders front. Some 5 German divisions were left in Flanders, and these their commander said would "no longer stand up to a serious attack." The principal obstacle to the Allied advance in Flanders was rain, which made the limited road net almost impassable and bogged down supply and transportation systems. The impasse lasted for two weeks, and it was not until October 14 that serious operations could be resumed. On October 20, the Lys River was reached. By October 28, the successes of Haig's armies in the Selle battles had forced a general German withdrawal, and Albert's armies advanced that day without serious opposition to the German position on the Scheldt. Though not as strenuously engaged as the troops in the two principal offensives, the king's army group played its role well in the execution of the over-all plan.

Operations of the French Center.—Four French armies participated in the offensive in the sector between Haig's British and Pershing's American armies. The role of the French First Army at the right of the British advance and that of the French Fourth Army on the American left have been described. Between these two armies the line was held by the Fifth and Tenth armies, whose task was to harass the enemy on their fronts, prevent their movement to other fronts, and hamper their withdrawal so that they might be trapped by the British and American pincers. This relatively passive assignment was an odd one for Frenchmen who had been imbued with Foch's philosophy of "*l'attaque, toujours l'attaque*" ("keep on the offensive")—a philosophy which, under Gen. Joseph Joffre's skillful guidance in 1914, had turned the tide at the Marne after two heartbreaking weeks of retreat and had led the French to a brilliant victory; and which, conversely, in the hands of the obstinate and pompous Nivelle, had led brave Frenchmen to disaster at the Aisne in 1917, with consequent demoralization and mutiny in the French Army. Nevertheless, the French played their unusual role well, but the pincers did not close, and by October 31

the Germans in the center had withdrawn to a shortened line. This shortening of the line required fewer French troops in this section of the front, and some were withdrawn and formed into a new Tenth Army (the old Tenth Army remained in position, but was renamed the Third). The new army was sent to the Lorraine front, to the right of the Americans, where, with the French Eighth Army, it was to engage in an offensive northward on both sides of Metz. This offensive was scheduled for November 15, but the armistice on November 11 made it unnecessary.

German Situation.—On October 31, the Germans in the north held the line of the Scheldt. This position had not been fortified as strongly as the Hindenburg Line or the defenses of the Selle, for the Germans had had great confidence in the impregnability of their forward defenses. In the south, in front of the French Fourth and American First armies, they still held the greater part of the formidable Kriemhilde Line and the Bourgogne Wood, just north of the Argonne Forest. The setbacks of the past month, however, had lowered the morale of the German troops to the danger point. German sailors had already lost their fighting spirit, and on November 3 they mutinied at Kiel. Within a few days revolutionary councils of soldiers and workers, like those of the Bolsheviks in Russia, had been established in a number of German cities. These uprisings, combined with the collapse of Germany's allies in late October, created serious unrest, but the military press agencies (through which all military information now passed) continued to try to deceive the people with favorable reports of activities at the front, describing reverses as planned withdrawals to stronger positions.

Nevertheless, Ludendorff was confident of German capabilities to effect an orderly withdrawal to the line of the Meuse, using the time thus gained to secure better armistice terms. President Wilson's reply to the German request for an armistice had not been to Ludendorff's liking. It had prescribed the acceptance of Wilson's Fourteen Points, the cessation of submarine warfare, and the evacuation of all occupied territories as preliminary requirements. The German government was convinced of the hopelessness of the situation, however, and on October 20 signified its acceptance of Wilson's terms. The president then referred the matter to the Allies jointly.

The Reichstag suggested that "the defeated general [Ludendorff] should offer his resignation and retire." Instead, on October 25, Ludendorff issued an order of the day to the troops in which he described the armistice terms as unacceptable. On October 27, the kaiser informed Ludendorff of his intention to consult other generals, whereupon Ludendorff tendered his resignation; the kaiser hastened to accept it. Gen. Wilhelm Groener, who replaced Ludendorff, realistically considered the lack of reserves, the morale of the troops, and the near collapse of the railway system. Each day he reported progressive deterioration; finally, on November 6, he urged that an armistice be effected not later than November 9 to avoid chaos. Soldiers' councils had already been formed at the front; and on November 8, a large group of senior officers, called from the front for a conference with the chancellor, Prince Max of Baden, agreed that the army could not be relied on if it were ordered to quell uprisings.

at home. By now the longing among the civilian population for peace had become the paramount consideration. Almost all Germans turned against the kaiser as the one who prolonged the war solely to perpetuate his regime. On November 9, Prince Max announced William's abdication, and a German Republic was proclaimed.

Allied Operations, November 1-11.—By November 1, the Allied armies had consolidated their positions, put their supply lines in order, and brought up ammunition and supplies for a continuation of the offensive. Foch's plan of operations for this final phase of his general offensive was substantially the same as his initial plan. The major thrusts would be delivered by the British in the west and the Americans in the south, both being aided by the French armies on their flanks. The British would force the line of the Scheldt, advance to Maubeuge, and press on to capture crossings of the Meuse from Namur to Dinant. If these crossings could be captured before the Germans withdrew from Flanders, they would be pressed against the Dutch border and captured. In the south the rapid seizure of Mézières and Sedan by the American First and French Fourth armies would, it was hoped, isolate the Germans facing the French center armies.

Allied Attacks from the South.—On November 1, in cold, wet weather (which continued along the entire western front until the end of hostilities), Liggett's American First and Gouraud's French Fourth armies attacked astride the Bourgogne Wood. On that day, they advanced 5 miles; on November 2, they drove 6 miles farther, the Americans capturing Buzancy. Constant pressure affected the already low morale of the German troops, who finally broke, offering little resistance. On November 3, the Americans drove 5 miles through the German lines and joined forces with the French Fourth Army beyond the Bourgogne Wood. This advance brought the rail line running southeastward from Sedan within range of American artillery, and it quickly pounded the rail centers of Montmédy and Longuyon, through which the Germans were attempting to withdraw troops and supplies. By November 7, the American 1st Corps had pushed back German rear guards and reached the heights of the Meuse overlooking Sedan, for an aggregate gain of 21 miles since November 1. Gouraud's troops, confronted with the task of breaching strong defenses, and with a greater distance to go, reached the Meuse opposite Mézières on the evening of November 10. At this juncture, Foch shifted the left boundary of the American First Army to the east of Sedan to allow the French to capture that city, and thus erase the stigma of the disastrous defeat by the Germans there in 1870. The two armies closed up to the Meuse before the armistice on November 11 halted operations.

As the offensive moved northward, the American 3d Corps crossed the Meuse to the east and occupied Dun-sur-Meuse on November 4. Subsequently, three French corps on the left wing of the American Second Army advanced through the hills east of the Meuse, and at the time of the armistice these American and French troops were within 6 miles of Montmédy. On November 10, the American Second Army began an offensive toward Briey, which was halted by the armistice after slight gains had been made.

Allied Attacks from the West.—The British also began their final phase of the offensive on

U.S. War Dept. General Staff

Gen. Erich F. W. Ludendorff (second German officer from left) and Field Marshal Paul von Hindenburg (third from left, in profile) in Brussels in August 1918.

November 1. Haig's first task was to force the German defenses of the Scheldt. To avoid the difficult terrain and intricate dike system immediately in front of his forces, he made his principal attack south of Valenciennes, using elements of the British First and Third armies. By the night of November 2, the Canadian Corps had captured the town. On November 4, Haig launched a general offensive on a 30-mile front, which by evening had advanced 5 miles beyond Valenciennes. On the British right, Debeney's First French Army advanced to the north of Guise. The fighting had been bitter, but the Scheldt position had definitely been turned, and German resistance collapsed. Meanwhile, south of Ghent, French and American units of King Albert's force drove the Germans back from the Scheldt, and the Americans captured Oudenaarde (Audenarde).

The Germans withdrew all along the line, hampered by blocked roads, traffic snarls, a shortage of rail equipment, and Allied air attacks on their retiring troops and transport. On the other hand, the Allied pursuit was slowed because of lengthening supply lines and the methodical demolition of supply routes by the Germans as they withdrew. On November 7, the British entered Bavay; on November 8, Avesnes; and on November 9, Maubeuge. The French armies, following up the advance of the British and Americans on their flanks, took Hirson on November 9. King Albert's troops joined in the pursuit, which now extended along the entire front. Tournai and Renaix (Ronse) were occupied, and a Canadian division entered Mons a few hours before the armistice.

The Armistice.—The Allies had left the details of the armistice terms to be arranged by their military leaders. Pershing objected to granting an armistice at all, preferring to continue the attack until the German forces were obliged to lay down their arms in the field. Foch's view was that additional bloodshed was unnecessary if the terms of the armistice were sufficiently rigorous to deprive Germany of the ability to continue the war, and they were so made.

Actually, though the German armies had been beaten, the Allied armies were in no position to administer a *coup de grâce* before winter put an end to serious hostilities. The advance of November 1-11 had strained their logistical

support systems to the breaking point. Despite concentrated efforts to repair and operate the railroads, supply railheads lagged behind the troops by 50 to 100 miles. Motor transport had to be used to haul supplies for these intervening distances over roads strewn with mine craters and blown bridges. Under such conditions vehicles broke down in large numbers. Foch had urged his commanders to make final efforts to destroy the retreating Germans, and Rawlinson, Debeney, and Pershing had organized pursuit forces. It is unlikely that any but small pursuit columns could have pressed forward on November 11, and these could have had only minor local effects in a withdrawal of such magnitude. If the Germans could prevent the collapse of the home front and the disintegration of their armies, there was little to prevent them from establishing a position behind the Meuse. In this case the war would have continued into 1919.

Occupation of Germany.—The Allies' armies paused on the armistice line for almost six days, ostensibly to allow the Germans time to begin an orderly withdrawal, but also to permit the solution of their own logistical problems. Early on November 17, the movement toward Germany began. The advance was conducted slowly and without enemy interference; only about one fourth of the Allied armies participated. Nevertheless, the general advance was almost halted in early December because supply trains had fallen far behind schedule. In addition to supplying the troops, it was now necessary to provide food for the millions of civilians in the liberated areas, who were on the verge of starvation. Moreover, the Germans released large numbers of prisoners as they withdrew, and these also had to be cared for.

On December 1, the Allied armies marched into Germany proper. Later that month, in accordance with the armistice terms, bridgeheads with a radius of 30 kilometers were established east of the Rhine around Cologne (occupied by the British), Coblenz (occupied by the Americans), and Mainz (occupied by the French). Subsequently the occupation forces were reduced despite Foch's protests. The Americans withdrew the last of their forces in January 1923; the British, in December 1929; and the French and Belgians, in June 1930.

GENERAL COMMENTARY

Defeat of the German Army.—When it became clear to the German military leaders that victory was no longer possible, they made every effort to escape the blame. No military leader participated in the armistice discussions. Though several admitted defeat to Allied leaders, the situation was portrayed differently to the German people. The theme adopted was that the war had been terminated to prevent further bloodshed and to raise the blockade so that the sufferings of women and children might be alleviated. Returning troops were received as conquering heroes and marched in holiday fashion through gaily decorated streets. When this myth began to be exploded, the German Army accused the home front, charging that its disloyalty and lack of support had caused the catastrophe. Ludendorff heard the phrase "stabbed in the back" and took it as his slogan. Later, Adolf Hitler was to adopt this theme in his exhortations to his Nazi followers. Nevertheless, the facts prove without question that the German

Army had been decisively defeated in 1918.

American Participation.—The importance of American participation in the war has often been exaggerated in the United States and minimized in Britain and France. At the time of the armistice there were more American troops in France than British troops, and they held a wider front. The American Army was still growing rapidly, and munitions production in the United States was reaching great heights. If the war had lasted until 1919, American troops would undoubtedly have struck the principal blows. While the United States can scarcely claim to have played the major role in the war, it may fairly be said that it could not have been won without American aid.

To participate effectively in the 1918 battles, the American Army required substantial support from its allies. A little more than half of the 2 million American troops shipped to France were transported in British vessels. Divisions arriving overseas before July 1, 1918, had to be equipped with the French automatic rifle and machine gun; those arriving thereafter had the new American Browning automatic rifle and machine gun, considered the best in the world at the time. Almost complete reliance had to be placed on the French for artillery: of the 2,250 artillery pieces used by the Americans in action, only about 100 were of American manufacture. On the advice of her allies, the United States concentrated on producing aircraft engines and observation-bomber planes. The 12-cylinder Liberty engine was developed and put into mass production. It was a superior engine, in great demand by the British and French, and constituted the greatest single American contribution to World War I aviation. By the end of the war, 45 American squadrons were operating at the front, but only about a fourth of them were equipped with American-built aircraft. American battle casualties during their brief role totaled 257,404—a very small number compared with the millions suffered by each of the other Allies during four years of bitter war.

Developments in Warfare.—World War I saw an increasing tendency toward the subordination of man to the machine. The growing importance of armament meant that a nation's industries exerted a decisive influence on its military operations. The bravest and most skillful fighting man, if improperly armed, might find himself helpless in combat. Logistics was transformed from a relatively simple business to a vast field of endeavor equal in complexity and importance to the control of operations. The proportion of noncombatant soldiers needed for the great logistical machines would have astounded Frederick the Great or Napoleon, though it did not approximate the proportion that was to be required in World War II.

The introduction of new methods, based upon the design and production of new equipment, was an outstanding feature of the war of 1914–1918. Except for the atomic bomb, almost every major development of World War II was foreshadowed in World War I. The tactical effect of the increased power of the machine gun and the modern artillery piece gave an ascendancy to the defense that baffled commanders on both sides for a long time.

The tank was undoubtedly the war's most remarkable development in the field of ground combat. Despite its slowness, limited operational

radius, and mechanical unreliability, it achieved some spectacular results in 1918; and even the brilliant Ludendorff was unable to find any adequate means of coping with it.

The airplane became an important weapon. Though the results attained by airpower during the war were hardly decisive, its potential was clearly demonstrated. By war's end strategic bombing had passed its infancy. German dirigibles and aircraft had bombed London, and British aircraft had frequently bombed Rhineland towns. Had the war lasted another week, British bombers would have attempted to bomb Berlin with one-ton bombs.

Gas warfare was employed on a large scale by both sides—initially, with serious effects. Countermeasures were promptly developed, however, and poison gas became a harassing rather than a decisive weapon.

The warring nations undertook psychological warfare on a systematic basis. The Germans harassed Paris with their long-range gun, and propaganda "hate" campaigns and subversive leaflets were used by both sides. Many of these efforts were amateurish by later standards, but they had considerable effect.

Throughout the war the development of battle tactics centered on the basic problem of breaking through a strong defensive position without prohibitive casualties and such loss of time as to make the breakthrough useless. What was accomplished by the capture of a trench line if it took so long that the defender had time to construct another a mile or so in the rear? In his first three drives of 1918, Ludendorff solved the initial breakthrough problem by achieving surprise and by creating a highly efficient body of troops. He gained great local successes, but he could not win a strategic decision because he had no powerful, highly mobile force capable of extended operations to exploit a tactical breakthrough. The Allies, however, were never able to force tactical breakthroughs comparable with those achieved by Ludendorff.

In a military sense the net result of World War I was that the Allies became convinced of the superiority of the defense and made their future plans and preparations accordingly; the Germans, having been frustrated by the lack of a strategic exploiting force, sought ways to build one. They found an answer in the tank-airplane team, the heart of the blitzkrieg, which in 1940 achieved in three weeks what the Germans could not do in the four years of World War I.

8. Eastern Front

Russian and German strategy and tactics on the eastern front were determined largely by the terrain. In the middle of the line was the Polish salient, at this time a part of Russia, comprising an area 230 miles long and 210 miles wide and leading directly into Germany. On the broad Vistula River, which crossed the salient, was

the fortress city of Warsaw. Warsaw had important defensive value, but it could also serve as a base for a Russian offensive westward into the rich mining and industrial area of Silesia.

Russia could not make a direct advance against Silesia and Berlin, located only 180 miles from the western extremity of the salient, without first safeguarding the flanks of East Prussia to the north and Galicia to the south. If the Germans in East Prussia and the Austrians in Galicia launched converging attacks across the flat land against Brest-Litovsk (now Brest) at the center of the salient, Russian forces west of the Vistula could be cut off. To defend themselves against such attacks, the Russians built a series of fortresses along the Neman and Narew rivers and at Lublin and Kholm (now Chełm). No Russian troops were stationed in the area west of Warsaw, which was kept without railroads and roads in order to prevent a rapid German advance.

To defend East Prussia the Germans constructed fortifications on the upper Vistula and a forward line in the lake district east of Allenstein (now Olsztyn), while in Galicia the Austrians built a fortified defensive barrier along the Carpathian Mountains centering on Lemberg (now Lvov) and running from Kraków to the Rumanian border. Thus the Polish salient was hemmed in and threatened from both north and south. Russia proper was divided from the salient by the Pripet Marshes, a region of swamps, forests, and few roads. To the north, south, and east stretched vast areas that could swallow whole armies.

Railways played an important role in the strategy of the eastern front. Germany had 17 lines leading to the Russian frontier, with a capacity of 500 troop trains daily, enabling her to concentrate a vast force on the border within a few days of a declaration of war. Piercing the Carpathians were 7 Austrian rail lines, permitting a flow of 250 trains daily from Hungary into Galicia. Both the German and Austrian railway systems also had numerous spurs branching off from the trunklines and running parallel to the frontiers. These facilitated rapid deployment and redeployment to repel attacks or to mount offensives. On the Russian side 6 trunklines, several of which were double tracked, radiated from Warsaw to the interior. All the military strength of the Russian Empire could be drawn up along the lines passing through Kiev, Moscow, and St. Petersburg (renamed Petrograd in 1914), but there were few spur lines. The relative lack of north-south lines prevented the Russians from rapidly shifting men along the front to mount surprise attacks or to counter German tactics. These shortcomings in railway transportation (and in the road network) later handicapped the Germans as they penetrated Russia east of the Polish salient.

War Plans.—The initial events on the eastern front were dominated by German strategy in the west. Germany had long prepared for a war on two fronts. In 1890, Field Marshal Count Helmuth von Moltke had devised a plan to defend the western front and throw Germany's main strength against Russia before concentrating on the defeat of France. This strategy was subsequently reversed by Count Alfred von Schlieffen. According to the celebrated Schlieffen Plan, Germany's entire strength was to be directed against France, leaving virtually no forces in the east.

The French armies were to be captured or destroyed within six weeks, and the troops then shifted to the eastern front for a full-scale drive against Russia.

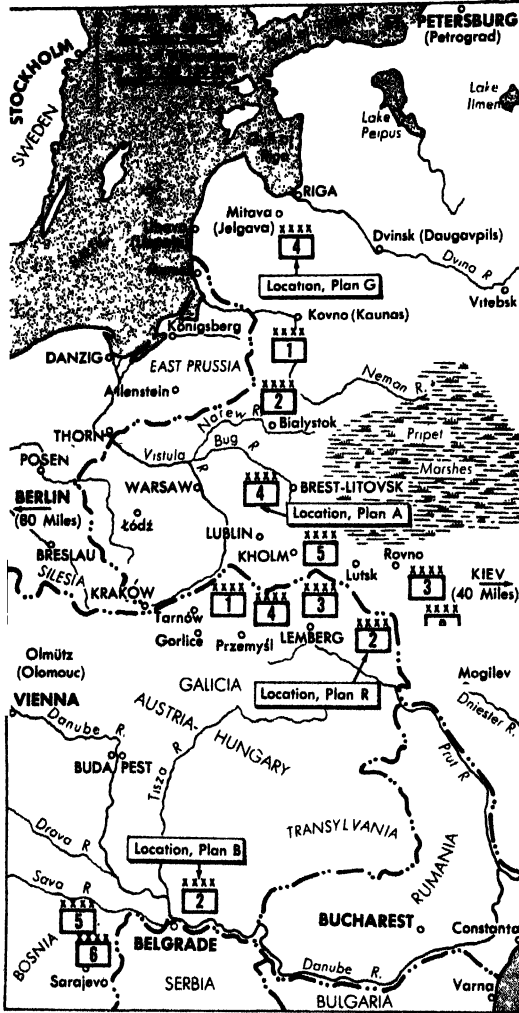

This plan assumed that Russian mobilization would be slow, and that it would therefore be safe initially to leave German territory in the

not assisted by Germany, the net effect of the Schlieffen Plan would be to give Russia complete freedom of action to occupy East Prussia and Galicia and march toward Berlin. For these reasons, Moltke decided to station an army in East Prussia and support it with strong garrisons at Germany's eastern fortresses. As will be seen, Moltke's modifications of the Schlieffen Plan played a key role in the repulse of the initial Russian offensive and in the German victory in the campaign around Tannenberg (now Stębark).

Austria-Hungary and Russia each had two war plans. One Austrian plan assumed a war with Serbia alone, which would be invaded by three armies, while the other three Austrian armies guarded the Russian front in Galicia and Russia. In this case, four armies would be thrown into battle against Russia, and two would invade Serbia. Of the Russian plans, one was wholly defensive and assumed that Germany would make her first major effort in the east. The army groups in the north and south would retreat eastward until a counteroffensive could be organized. The second plan, which was actually effected, was offensive. It envisaged the main German attack against France and provided for Russian drives against East Prussia and Galicia in order to safeguard both flanks of the Polish salient in preparation for an invasion of Silesia. When war was declared in August 1914, the French, fearing an all-out German drive in the west, urged an early Russian offensive to divert German forces to the east. Much to their regret, the Russians succumbed to their ally's insistence.

Tannenberg Campaign.—Russian mobilization proceeded rapidly after the outbreak of war and was accompanied by great enthusiasm. The people considered the struggle a defensive war against German imperialists, who had long threatened Russia and exploited her economically. By mid-August the commander in chief, Grand Duke Nicholas, and the chief of staff, Gen. Nicholas Yanushkevich, had nearly 2 million men on the front line. Although this was only a third of the potential fighting force, and although logistical support for an offensive was lacking, the Russians heeded the pleas of their French ally and ordered converging attacks to start on August 13 from the east and southeast against East Prussia. Gen. Paul Rennenkampf's First Army and Gen. Alexander Samsonov's Second Army, both under the over-all command of Gen. Ivan Zhilinsky at Warsaw, immediately moved their troops into advance positions for the attack. Rennenkampf crossed the border on August 17, five days before Samsonov was scheduled to do so. The plan was to draw German forces north and east, enabling Samsonov's army to envelop their rear. This strategy failed because of the lack of adequate information about German troop dispositions, faulty liaison, and the fact that Rennenkampf did not carry out Zhilinsky's orders to weight his north flank so as to drive the German garrison from Königsberg (now Kaliningrad).

At his headquarters in Allenstein the German eastern front commander, Col. Gen. Max von Prittwitz, ordered three corps to the Angerapp (Węgorzpa) River area, to guard against invasion from the east, and his fourth corps to the Tannenberg area, to guard the southern border.

WAR PLANS; EASTERN FRONT. Germany's plan provided for its Eighth Army to hold the Russians until France had been defeated; then full German power would be turned against Russia. Russia's plans were based on two contingencies: Plan G, an offensive plan, if Germany's main effort was directed against France; and Plan A, a defensive plan, if the effort was directed against Russia. The only difference in troop dispositions was the location of the Fourth Army. Similarly, Austria-Hungary provided for war against Serbia alone (Plan B) and for war against both Russia and Serbia (Plan R).

east undefended. By 1913, however, it was clear that this premise was no longer valid, for Russia was enlarging and improving her army and building military railways. Col. Gen. Helmuth von Moltke, nephew of the field marshal, therefore modified the Schlieffen Plan. He realized that Russia was bound by treaty to take the part of France and would mobilize rapidly from the first sign of hostilities. Since Austria-Hungary would remain on the defensive if she were

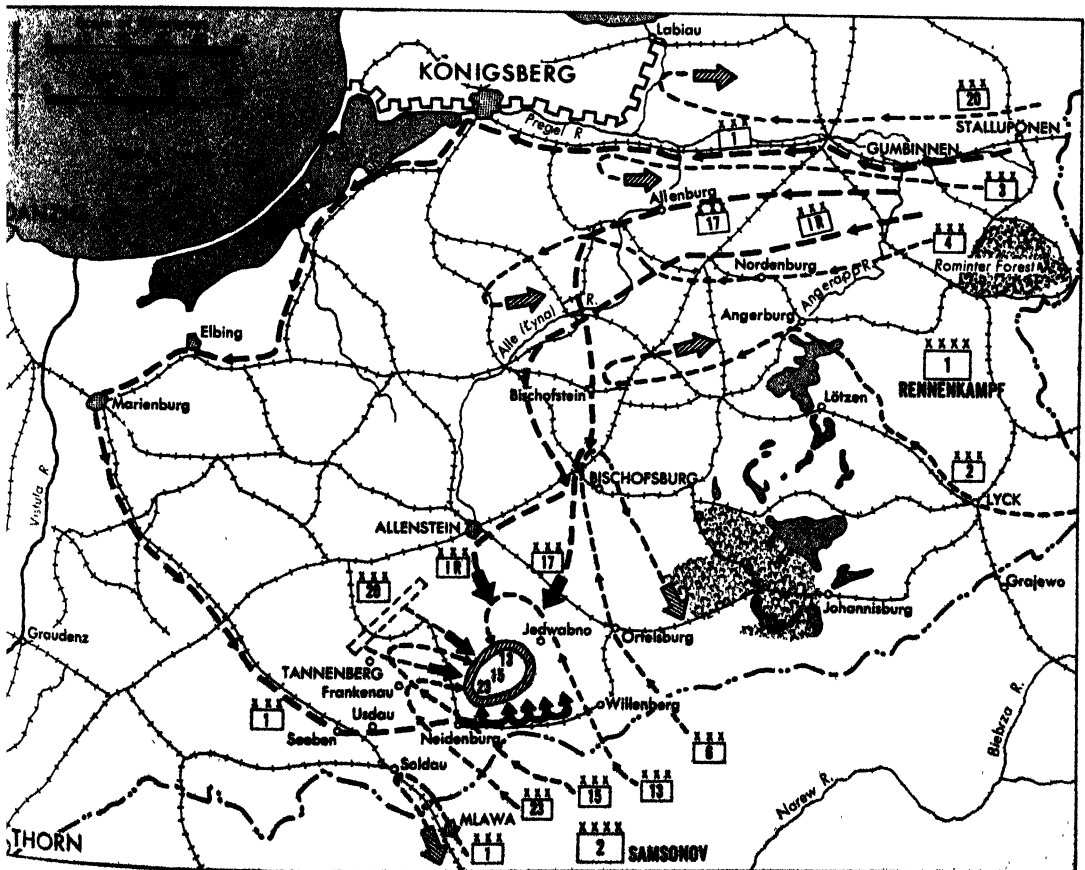

Although he was authorized by the high command to withdraw to the Vistula if necessary, he knew that he was expected to use the terrain and railroads to organize a defense against anticipated successive Russian blows. By means of spies and intercepted radio messages, which the Russians habitually sent uncoded, Prittwitz had obtained information concerning Zhilinsky's battle orders. What he did not know was that the headstrong commander of his 1st Corps, Gen. Hermann von François, had moved forward independently to Stallupönen (now Nesterov) on the border, where he was prepared to fight to prevent Russian violation of Prussia's "sacred soil." When a Russian corps approached, François counterattacked, inflicting heavy casualties on the invaders. Tactically, his action was sound, but it upset Prittwitz' carefully planned strategy. Time was important to the German commander, for he had only five days to defeat Rennenkampf before he would have to turn his armies south to stop Samsonov's anticipated attack. Prittwitz therefore planned to lure Rennenkampf westward into a decisive battle on the Angerapp River. François' counterattack delayed the Russian advance to the contemplated major battlefield.

Fortunately for the Germans, Rennenkampf did not appreciate the danger to his forces. He continued his advance for two days, approaching

but not reaching the Angerapp. By this time, François had consolidated his forces at their designated position around Gumbinnen (now Gusev), but he urged Prittwitz to order an immediate counteroffensive. Over the objections of his brilliant operations officer, Lt. Col. (later Maj. Gen.) Max Hoffmann, who wanted time to bring up two corps entrenched west of the river, Prittwitz gave in and ordered a full-scale attack for August 20.

As Hoffmann feared, the German attack was made piecemeal and achieved little success. Along the greater part of the front the German troops were repulsed. The result was a stalemate, but Prittwitz needed a decisive victory. He had to make up his mind whether to resume the attack or to withdraw toward the Vistula. Later on August 20, news was received at his headquarters in Allenstein that Samsonov's Second Army had already entered East Prussia. Prittwitz thereupon telephoned Moltke that he would withdraw to the Vistula, but that he would need reinforcements to hold the Russians even there. Moltke's immediate reaction was to relieve Prittwitz of his command, and by August 23 his successor, Gen. (later Field Marshal) Paul von Hindenburg, called from retirement, reached the front with his chief of staff, Maj. Gen. Erich F. W. Ludendorff, who had already distinguished himself in

TANNENBERG CAMPAIGN (Aug. 17-29, 1914). Germany having made its main effort against France, Russia immediately launched its offensive Plan A against both East Prussia and Austria in accordance with its agreement with the French, although its forces were only partially mobilized. The First Army advanced from the east and engaged elements of the German Eighth Army at Stallupönen and Gumbinnen without material results. Meanwhile, the Second Army entered East Prussia from the south to trap the German Eighth Army. In a brilliant operation the Germans shifted front to engage the Second Army, encircled three Russian corps, and virtually destroyed the Second Army. The Russian First Army, which had made a halfhearted effort to assist the Second, then turned about and withdrew.

the fighting on the western front.

While Hindenburg and Ludendorff were to be credited with reversing the tide of battle and achieving a German victory at Tannenberg, Hoffmann actually developed a new strategic plan before they arrived at the front. Between August 20 and 23, he moved a division and a corps from the front against Rennenkampf to face Samsonov's advancing Second Army in the south, which was threatening to cut off the German troops by a drive northwestward to the Gulf of Danzig. Two additional German corps were moving westward and were ready to turn south if Rennenkampf did not press his advance.

Hoffmann's plan was approved by Hindenburg and Ludendorff. The German forces were now concentrated against Samsonov's slow-moving offensive, with only a cavalry division and a brigade left in the north to delay Rennenkampf. The shift was a daring maneuver, but the Germans could well afford it. Inadequate railroads and roads, virtually nonexistent logistical support, and dissension between Zhilinsky and Samsonov slowed the Russian advance. These difficulties, as well as the day-to-day tactics of the Russians, were well known to the Germans, because they were broadcast in plain language by Zhilinsky's headquarters and by Rennenkampf and Samsonov in the field. The lack of trained code and communications personnel proved a major handicap to the Russians.

On August 24, the middle of Samsonov's line met entrenched German opposition at Frankenau, and heavy fighting broke out that lasted all day. Since Samsonov still thought the Germans were in flight to the west, however, it was announced on his radio that August 25 would be a day of rest.

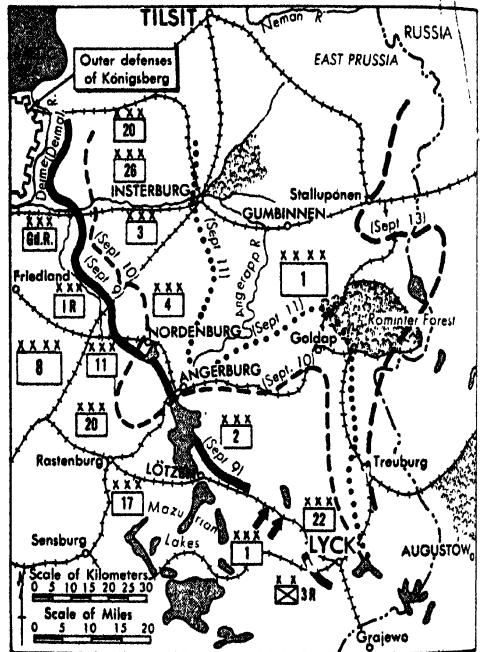

The Germans did not rest. Assured that they would have time to concentrate their strength against Samsonov before Rennenkampf was able to intervene, Hindenburg, Ludendorff, and Hoffmann set their trap. The 20th Corps at Frankenau was withdrawn northwestward and dug in at Tannenberg. To the south garrisons transported from Königsberg and the Vistula prepared a breakthrough at Usdau (now Uzdowa); and at Bischofsstein (now Bisztynek), to the northeast of Allenstein, German forces diverted from the front against Rennenkampf were detrained to strike a decisive blow at the Russian rear. On August 26, François' 1st Corps, which had been moved south, took Secben. On the same day, the Russian 6th Corps was routed by the German 17th and 1st Reserve Corps just north of Bischofsburg (now Biskupiec), and the envelopment of Samsonov's northern flank began. The Russian 6th Corps escaped across the border south of Ortelburg (now Szczytno), as did their 1st Corps via Mława; but the three central corps (13th, 15th, and 23d) were threatened with encirclement by the four German corps.

Samsonov does not seem to have realized the full measure of the disaster until the morning of August 29, when the Russian retreat had become general. During the day the Germans forced the three fleeing Russian corps into a pocket that constantly grew smaller. On August 30 and 31, the Russians tried to break through François' lines, but they succeeded only in retaking Neidenburg (now Nidzica), which they had to evacuate again the following day. All escape routes were now tightly sealed. The Germans captured 125,000 men and 500 guns in the Tannenberg

pocket, whereas their own losses for the whole campaign totaled between 10,000 and 15,000 men. There are no accurate figures on the Russians killed and wounded, but the losses were staggering. Defeated and despondent, Samsonov committed suicide.

The Tannenberg campaign thus ended in a great German victory. Rennenkampf's army in the north was still intact, however, and Hindenburg, Ludendorff, and Hoffmann now made plans to dispose of these remaining Russian invaders.

Masurian Lakes Campaign.—Rennenkampf had been ordered by Zhilinsky to come to the aid of the Second Army, but his troops did not have time to reach the battlefield. On August 30, the First Army commander learned of the catastrophe at Tannenberg and turned his own forces back. With his right flank on the Baltic Sea, his left flank extending to the Masurian Lakes, and a corps protecting the Lötzen (now Giżycko) Gap, Rennenkampf felt secure against a German offensive.

MASURIAN LAKES CAMPAIGN (Sept. 9-14, 1914). After Tannenberg, the German Eighth Army, now augmented by reinforcements from the western front, concentrated its efforts against the Russian First Army. A successful German envelopment on the south flank made the position of the Russians untenable and forced them to withdraw. To cover the withdrawal, they launched a strong counterattack in the center, which deceived the Germans and allowed sizable forces to escape. Nonetheless, the Russian First Army was decisively defeated and expelled from East Prussia with large losses.

Again the Russians miscalculated. Zhilinsky reinforced the remnants of Samsonov's army in anticipation of a German offensive against Warsaw. Although the Austrians, who were in difficulties in their Galician campaign, urged the Germans to attack Warsaw, Hindenburg and his staff considered Rennenkampf's force their first objective. On September 9 and 10, the Germans secured the southern flank by Lyck (now Elk) and Augustów. An attempt to break through the Lötzen Gap was repulsed by Rennenkampf, but he had to commit all of his reserves to do so.

Then the German 1st Corps forced the Russian 2d Corps to retreat, clearing the route toward Gumbinnen. Fearing another Tannenberg, Rennenkampf ordered his army to withdraw. Meanwhile, to protect his retreat, he simultaneously launched a counterattack between Nordenburg (now Krylovo) and Angerburg (now Węgorzewo). The losses suffered by the German corps facing this attack alarmed Ludendorff, who curtailed the advance of his right flank. The enveloping movement was therefore not so deep as he had planned originally, and Rennenkampf was able to save most of his army by forced marches of as much as 55 miles in 50 hours. Nevertheless, the Russian First Army sustained losses estimated as high as 145,000 men. German losses were in the neighborhood of 10,000 men.

Thus in three weeks, Hindenburg, Ludendorff, and Hoffmann had cleared East Prussia of the enemy. Zhilinsky, who complained to headquarters of Rennenkampf's deficiencies, was himself relieved of his command on September 17 in favor of Gen. Nicholas Russki, who had scored successes on the southern flank of the Polish salient in Galicia.

Galician and Polish Campaigns.—While Zhilinsky's forces were being driven from East Prussia, other Russian forces under Gen. Nicholas Ivanov fought the Austrians under Field Marshal Count Franz Conrad von Hötzendorf in Galicia.

GALICIAN BATTLES (Battles of Krasnik, Komarow, and Gnila Lipa; Aug. 23-Sept. 1, 1914). The Austrian and Russian offensives collided along the Galician border. On the left the Austrian First and Fourth armies drove back the Russian Fourth and Fifth armies in the battles of Krasnik and Komarow. On the right the Austrian Third Army advanced to the Gnila Lipa where it was forced to retreat by the Russian Third and Eighth armies.

Conrad von Hötzendorf's indecision jeopardized the Austrian position from the first days of the war. Initially, he committed three of his six armies against Serbia. Subsequently he withdrew part of one army, but it arrived too late to affect the outcome of the first Galician battles.

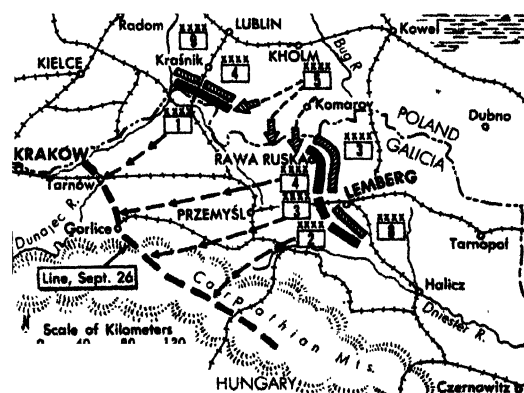

To make matters worse, Conrad von Hötzendorf decided that the Russians would probably concentrate their forces in the Lublin-Kholm area, and he deployed two armies in that direc-

Russians enter Lemberg (now Lvov) on Sept. 3, 1914, after routing the Austrians in the Battle of the Gnila Lipa.

tion, retaining only one for the defensive line southward from Lemberg. Ivanov also misjudged his enemy. Anticipating the major Austrian attack from Lemberg, he directed his own main attack in that area, while a weaker force moved down from the north through Krasnik, Zamość, and Komarow. Reconnaissance on both sides was poor. On August 23, the Russian Fourth and Austrian First armies collided unexpectedly at Krasnik. The Russians were forced back by August 25, and Conrad von Hötzendorf, prematurely elated, ordered his troops to attack at Zamość and Komarow, drawing reinforcements from the Lemberg front for the purpose. The Austrians scored limited gains in the Battle of Komarow (August 26-September 1), but they were wholly unprepared for the major Russian thrust at Lemberg, which also was launched on August 26. In the ensuing Battle of the Gnila Lipa (now Nilaya Lipa), the Austrians were routed, and Conrad von Hötzendorf, failing to see that he might still save the situation by ordering an enveloping drive on the Russian flank and possibly scoring a stunning victory against Ivanov's main force, ordered instead a general retreat. By September 8, the Austrian First Army had fallen back to the south of Krasnik, while the Second,

GALICIAN BATTLES (Battle of Rawa Ruska, Sept. 3-11, 1914). The Austrians sent their Fourth and Second armies (the latter rushed from the Serbian front) to assist their stricken Third Army. In its movement the Fourth Army left a wide gap in the line in the Komarow area through which the Russian Fifth Army poured. Threatened with encirclement from the north, the Austrians withdrew to the line of the Carpathian Mountains, leaving 100,000 men in the fortress of Przemysl, all of whom were lost when the fortress subsequently surrendered to the Russians.

GERMAN NINTH ARMY IN POLAND (Sept. 28–Nov. 24, 1914). The Germans formed the Ninth Army in southern Poland to bolster the Austrians after their defeats in the Galician battles. The Russians, meanwhile, prepared to launch a huge offensive into Germany. To forestall this offensive, the Ninth Army attacked toward Warsaw, supported by the Austrian armies on the right. The attack was turned back at the gates of Warsaw by superior Russian forces, and the Germans and Austrians withdrew to their original starting line. The Ninth Army then shifted rapidly to the Posen-Thorn area, drove between the Russian First and Second armies, and almost succeeded in enveloping the Second Army in the Battle of Łódź. These operations of the Ninth Army definitely stopped the proposed Russian invasion of Germany.

Third, and Fourth armies were endeavoring to consolidate their hold on the Lemberg front. This development opened a huge gap through which the Russian Fifth Army poured. Tired and disorganized from days of entraining and detraining, the Austrians gave ground. This engagement is known as the Battle of Rawa Ruska (now Rawa-Russkaya). The battlelines on September 26 show that the Austrians had withdrawn 100 miles; they had suffered 350,000 casualties.

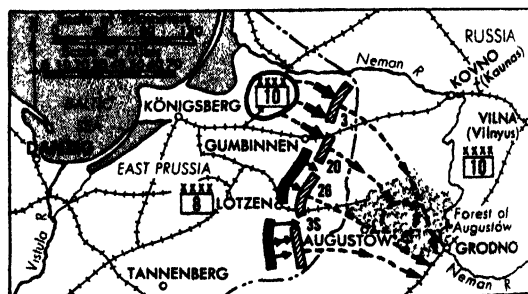

Ivanov scored a decisive victory in Galicia. The way was now open for the Russian forces to enter Silesia unless the Germans could stop them. Following their defeat in the First Battle of the Marne, the Germans could not afford to transfer troops from the western front, however, and Hindenburg was compelled to rush troops from East Prussia to help the Austrians. On September 28, a newly constituted German Ninth Army detrained at Chenstokhov (now Częstochowa) for this purpose.

The imminent Russian threat to Kraków made immediate action imperative. Hindenburg's goal was to seize crossings on the lower Vistula preparatory to an advance on Warsaw. The Ninth

Army reached the river on October 9. Intercepted Russian radio messages gave Hindenburg a clear picture of Ivanov's strategic plan to encircle the German left flank, but the Germans continued on their course, and by mid-October they were within 12 miles of Warsaw, the high-water mark of their offensive. Then Russian pressure, combined with Austrian weakness on the southern flank, forced them to withdraw, and by November 1 they had fallen back to the starting line of September 28.

Meanwhile, the French again besought their Russian allies to invade Silesia via Warsaw and Posen (now Poznań) in order to relieve German pressure on the western front. Since Silesia's mineral resources and industrial plant were vital to their war effort, the Germans could be expected to withdraw troops from the west to combat an all-out Russian offensive. The Russians acquiesced, but Hindenburg blocked their plan for a drive straight through the Posen-Thorn (now Toruń) area and was able to move the Ninth Army into position in time to parry the expected Russian blow with an offensive of his own. On November 11, the German forces under Gen. (later Field Marshal) August von Mackensen's command attacked north of Łódź, in four days they advanced 50 miles. Nevertheless, the Russians started their Silesian offensive on November 14, not realizing until November 16 that their Second Army was being encircled in the Łódź area. They managed to extricate their troops from Hindenburg's trap, but the cost was great; Łódź fell to the Germans, and the Russian drive into Silesia had to be abandoned.

Operations in 1915.—Winter Battle of Masuria.—In January 1915, Hindenburg and Ludendorff persuaded Emperor William II that an effort should be made to knock Russia out of the

WINTER BATTLE OF MASURIA (Feb. 7–21, 1915). The plan of the Central Powers for 1915 was to drive Russia from the war. It envisioned an offensive from East Prussia by the Germans and a simultaneous advance by the Austrians in the Carpathians. The Germans secretly concentrated their Tenth Army on the Neman River, attacked, and overwhelmed the Russians. The 3d, 26th, and 3d Siberian corps escaped, but the 20th Corps was encircled in the Forest of Augustów, and more than 100,000 prisoners were taken. This was a great tactical victory for the Germans, but the Austrian attack in the south failed, so that the over-all strategic gains were nil.

war. An Austrian offensive on the edge of the Carpathians in February failed, but the German Tenth Army, driving southward from the Neman River, forced a Russian corps to surrender in the Forest of Augustów. Although three other corps escaped, the Russian casualties totaled 200,000 (of these, half were prisoners). The winter Battle of Masuria thus resulted in a major victory for the Germans, but their over-all plan to eliminate Russia from the war did not succeed.

Gorlice-Tarnów Breakthrough.—By March 1915, war weariness had set in in Russia. On the home front food shortages in the cities, incapacities of administration, and corruption had created a desire for peace that was voiced by both left and right. On the fighting front the armies were too weak to launch a major offensive; clothing and ammunition were often in short supply. Meanwhile, the Germans were secretly developing an offensive base in the Gorlice-Tarnów area. Infantry and artillery were brought in from the western front to reinforce the Fourth and Eleventh armies for an attack. The offensive was launched on May 2 behind a barrage utilizing 950 artillery pieces. Taken completely by surprise, the Russians fled in panic. A complete breakthrough was scored two days later, and by June 22 the German juggernaut had rolled over Lemberg. Turning north, the Germans took Warsaw on August 4-5 and Brest-Litovsk on August 25. By the beginning of October, German armies had penetrated deep into Russian territory, the front running from just west of Dvinsk (Daugavpils) in the north southward through the Pripet Marshes to Kolmea (now Kolomyia).

GORLICE-TARNÓW BREAKTHROUGH (May 2-4, 1915). The critical Russian shortage of weapons and munitions led the Germans to believe that another offensive would eliminate the Russians from the war. The Eleventh Army (from the western front) attacked in conjunction with the Austrian Fourth Army, gained surprise, and practically destroyed the Russian Third Army. Continued German and Austrian attacks compelled the Russians, whose logistical problems were now acute, to withdraw to the line shown.

The Gorlice-Tarnów breakthrough and subsequent campaigns in 1915 cost the Russians 2,000,000 casualties, of whom half were prisoners. Meanwhile, on September 5, Czar Nicholas II assumed command of the Russian armies.

Operations in 1916.—Winter and Spring.—Following the losses of the Gorlice-Tarnów breakthrough, the Russians tried to rebuild their armies in preparation for a summer offensive. French entreaties for a diversion at the time of the German Verdun attack in February 1916 once again caused them to act prematurely. In March, the Russians attacked near Lake Naroch, but their drive was soon halted by stiff German resistance and by mud from the spring thaws. The eastern front then remained dormant while both

Mass is celebrated for Austrian officers in August 1915 at Lönle, Galicia, during Austro-German drive eastward.

sides got ready for the summer campaigns. The czar, no strategic genius, planned a July offensive north and south of the Pripet Marshes with the capture of Vilna (Vilnius) by the West Army Group as its first goal. In May, however, the Austrians launched an attack on the Italian front, and now it was Italy's turn to appeal to Russia for assistance. The czar agreed to create a diversion. The Russian commanders north of the Pripet Marshes felt unprepared to advance the date of the projected summer offensive, but the commander of the Southwest Army Group, Gen. Aleksei Brusilov, volunteered to attack alone, starting on June 4.

Brusilov's Summer Offensive.—Alone among high-ranking Russian officers, Brusilov had carefully studied German tactics. He concluded that it would be advantageous to forgo concentrations of superior manpower for the surprise to be gained through a rapid, highly mobile attack prepared in complete secrecy. Once his forces had been drawn into position, and his officers had been carefully briefed, he struck quickly and hard. His efforts were not in vain: the offensive achieved Russia's greatest success of the war.

The Austrian line on the Dniester and Strypa rivers was breached within a week. Brusilov's troops then took Lutsk and threatened the rail junction at Kovel (now Kovel). Again Hindenburg was compelled to come to the aid of the Austrians, but although German reinforcements slowed Brusilov's advance, they were unable to stop it. A recognized military historian, Col. Vincent J. Esposito, has written that the battle "became a race between the excellent German-Austrian lateral communications and the inferior Russian railroads. The Germans won" (*The West Point Atlas of American Wars*, vol. 2, opposite map 36, New York 1959). The battle-lines of September 20 show that Brusilov's offensive had carried the Russians to the Carpathians in the south and along a line running west of Stanislaw (now Stanislaw), Brody, and Pinsk. The drive had exacted a tremendous toll, however, and it collapsed because of the exhaustion of the troops and the lack of ammunition.

The Brusilov offensive had raised great hopes in Russia, all of which were now dashed, and the groundwork was laid for the revolution. It also had major consequences for the Germans. By weakening their position on the western front and helping to influence Rumania to enter the war on the Allied side, the offensive contributed to the eventual German defeat.

BRUSILOV OFFENSIVE (June 4–Sept. 20, 1916). Gen. Aleksei Brusilov launched a gigantic offensive to relieve Austrian pressure on the Italian front. The attack surprised the Austrians and gained striking initial successes. Through use of their superior rail net, however, the Germans shifted troops from the north and halted the Russian offensive. Losses totaled more than 1,000,000 men on each side. The strategic results of the Brusilov offensive were far reaching: Austrian losses were so great as to preclude further offensive action, and the Austrian offensive in Italy had to be halted; 15 German divisions had to be transferred from the Verdun front to the eastern front; Rumania entered the war on the side of the Allies; and Russia's huge losses started her on the road to revolution.

Revolution and Military Collapse in Russia.—When the Brusilov offensive ended without success and with huge losses, morale in the Russian Army quickly deteriorated. Ammunition supplies had run out, many soldiers lacked shoes and sufficient clothing, adequate food supplies had long ceased reaching the front, and to the soldiers it seemed that the leaders callously ignored the loss of lives. The czar refused to countenance the governmental reforms demanded by the left and alienated what little support remained for his rule among the liberal middle class. The slogan "Peace and Bread" reflected an overwhelming Russian desire. Rebellion broke out in Petrograd on March 12, 1917, and three days later the czar was forced to abdicate. A liberal provisional government headed by the socialist Alexander Kerenski was swept into office, but real power in the capital was exercised by the Petrograd Soviet of Workers' and Soldiers' Deputies.

At first, the overthrow of autocracy seemed a great advantage for the Allies, for Russia ap-

peared wholeheartedly to have joined the democracies of the west. But appearances were deceptive. The Petrograd Soviet's Order No. 1, designed to create a more democratic army, in fact caused the dismissal of the best and most experienced officers, and with the abolishment of capital punishment soldiers deserted by the thousands. The Germans realized that Russian demoralization would be exacerbated by inaction. No offensive was launched, but in April the high command brought Vladimir Lenin and his Bolshevik lieutenants east by sealed train from their exile in Switzerland. Hindenburg and Ludendorff expected that increased Bolshevik propaganda, the lack of discipline in the army, and the growing desire for peace in Russia would soon leave the Germans virtually unopposed on the eastern front.

Kerenski's undoing was that he tried to uphold Russia's obligations to her allies. The remaining Russian commanders—Russki, Brusilov, Lavr Kornilov, Vasili Gurko—insisted that the new government must not heed the popular desire for a separate peace with Germany. Kerenski gave in and authorized Brusilov to attempt a new offensive against Lemberg. On July 1, Brusilov led a force composed chiefly of Finns, Siberians, and Poles (the most reliable elements left in the Russian Army) against remnants of the collapsing Austrian Army. They registered gains of as much as 30 miles before a German counteroffensive sent them reeling back to the Galician frontier. The attack was a futile effort and the last Russian offensive of the war.

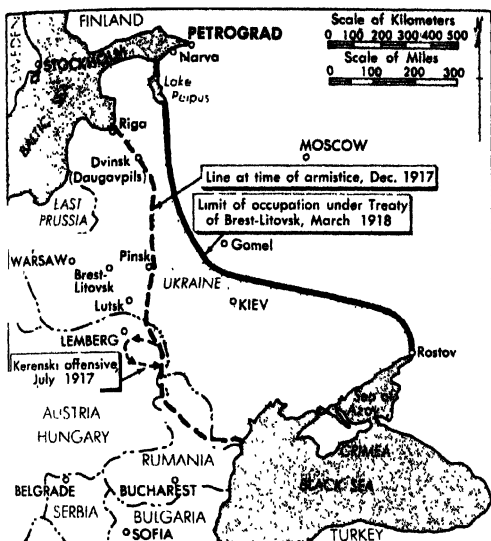

End of the War on the Eastern Front.—Hindenburg and Ludendorff calculated that one more successful German offensive would cause the overthrow of the Kerenski government and

remove Russia from the war. On September 1, the German Eighth Army assaulted Riga, capturing the city two days later and driving beyond it. The Kerenski government fell, and on November 6-7 (October 24-25, Old Style), Lenin seized power in Petrograd. The next day the new Soviet government adopted a peace decree. This was interpreted by Leon Trotsky, on November 21, as a request for an armistice. Hostilities on the eastern front were suspended on December 2, and the next day delegates of Russia and the Central Powers met at Brest-Litovsk to arrange terms. The armistice negotiations were succeeded on December 22 by a peace conference.

COLLAPSE OF RUSSIA (March 1917-March 1918). After the abdication of Czar Nicholas II on March 15, 1917, the Russian armies rapidly disintegrated. A last desperate attack was made—the Kerenski offensive—in July 1917. It met with some initial success, but the Russians were soon driven back. In September 1917, the Germans attacked the city of Riga to hasten Russian capitulation; on March 3, 1918, the Treaty of Brest-Litovsk was signed, under which the Germans occupied the area shown.

Trotsky, who became the head of the Soviet delegation in January 1918, haggled and played for time, hoping that the Bolshevik Revolution would sweep Germany and keep Russia from having to sign that power's severe peace terms. Pressed hard by the chief German delegate, Gen. Max Hoffmann, he tried an audacious maneuver. On February 10, he announced that Russia refused to sign the German terms and unilaterally declared the state of war to be ended. This amounted to a declaration of "no war—no peace." The reaction of the Germans was furious and immediate. They denounced the armistice, and at dawn on February 18 their troops poured across the lines, meeting no resistance. They captured Dvinsk in the north and Lutsk in the south. The next day, German headquarters received a telegram from Lenin accepting the peace conditions offered at Brest-Litovsk, but the advance continued to Lake Peipus and Narva in the north, where it directly threatened Petrograd. In the south, German troops swept through the Ukraine. Finally, on March 3, a peace treaty was signed

Militärhistorisches Forschungsamt

Fires caused by explosions in Kiev, occupied by the Germans during their drive into the Ukraine in March 1918.

at Brest-Litovsk. By its terms, Germany was to occupy a large expanse of Russian territory. If it had not been superseded by the subsequent armistice on the western front and by the Treaty of Versailles, Russia would have lost a third of her population, a third of her agricultural land, and more than half of her industry.

The war on the eastern front was over, and Russia lay defeated and wracked by poverty and civil war. Victory came too late for the Germans, however, for the long struggle had prevented them from ever concentrating all of their strength in the west.

9. Italian Front

Italy declared war on Austria-Hungary on May 23, 1915, and began active operations the next day. The initial Italian strategic plan, which had been developed early in April, envisioned operations in conjunction with the Russians, Serbs, and Montenegrins to break into the plains of Hungary and force the collapse of the Austro-Hungarian Empire. At that time the Russians had advanced to the foot of the Carpathian Mountains, deep in Austrian territory. Early in May, however, an Austro-German counterattack drove the Russians back and crumpled their southern front. Now, on May 24, the general situation, which had looked so promising for the Allies a month before, was dark indeed. Stalemated on the western front, frustrated in Gallipoli, and with Russia in serious straits, they were grateful for Italy's decision to join them. With the principal attention of the world focused on the titanic western front, the part played by Italy in the war has generally been underestimated. Some of the bitterest fighting under the most difficult conditions took place on the Austro-Italian front, and events there exerted considerable influence on the conduct of the war as a whole.

The general course of the war on this front

is simply told. Restricted by topographical considerations to offensive action on the single narrow front of the Isonzo River, the Italians launched 11 ferocious attacks there between June 1915 and September 1917. The resulting territorial gains were meager, but the attacks succeeded in so wearing down the Austrians that large German formations had to be rushed to the front to prevent a collapse. Meanwhile, an Austrian offensive from the mountainous Trentino in mid-1916 to relieve the pressure on the Isonzo front had failed. In the autumn of 1917 a combined Austro-German offensive on the Isonzo caught the Italians unprepared and brought on the debacle of Caporetto (now Kobarid). Forced back to the Piave River, the Italians, bolstered by Allied units, held firmly and repulsed all attempts to dislodge them. The sting of Caporetto brought a resurgence to the Italian home front that excited the admiration of the world. Factories hummed, and all hands turned with determination to preparations for the final victory. In the fall of 1918, these efforts culminated in the glorious Battle of Vittorio Veneto, in which the Austrians were eliminated from the war.

Strategic Considerations.—Nowhere has terrain exerted a more decisive influence on strategy than on the Austro-Italian front. Unfortunately for the Italians, this influence was for them predominantly adverse. The frontier, 484 miles in length, was divided into three distinct sectors: the Trentino (part of the South Tirol) on the west, the Dolomites and the Carnic Alps in the center, and the line of the Isonzo River on the east. The Trentino, which then belonged to Austria, formed a deep wedge into northern Italy. It was a rough, mountainous area which the Austrians had converted into a veritable fortress. Any major advance in the Trentino would have to be made up the Adige Valley, where it could easily be stopped in the fortified Trento (Trent) defile area or at the Brenner Pass farther north. Even if successful, such an advance would lead to no strategic objective of consequence. The Trentino pointed straight to the heart of northern Italy, and an Austrian offensive there would threaten to cut off Italian troops at the Carnic and Isonzo fronts. The area was detached from Austria proper, however, and it was served by only one railroad, which could not supply forces of the size necessary to ensure success. Furthermore, an excellent rail net enabled the Italians to shift troops rapidly from other fronts to counter an offensive in the Trentino.

The Carnic Alps in the central sector were forbidding. Mountain passes suitable only for Alpine troops were often situated at altitudes of over 6,500 feet. A breakthrough here might lead to the cutting of the rail line from Austria proper to the Trentino, but the great number of Italian Alpine troops needed for such a venture was not available, and the operational season in the mountains was only of a few months' duration.

The only area in which a decision could be reached by either side was the Isonzo front, and from the Italian point of view this front was less formidable than the others only by comparison. The Austrians controlled all the crossings of the Isonzo and the dominating mountains and high areas to the east, and any Italian attempt to cross the river was therefore subject to withering artillery and infantry fire. As one analyst described the Italian dilemma, "the river could not be crossed until the mountains had been seized,

and the mountains could not be seized until the river had been crossed." The principal features of the Isonzo front were the strongly fortified Gorizia (Görz) area in the center, the rugged Bainsizza (Bansizza) Plateau to the north, and the rocky, barren Carso (Karst; Kras) Plateau to the south, with its precipitous slopes rising as high as 900 feet above the sea, and dominated by two towering mountains, Monte San Michele and the Hermada. In short, fighting by the Italians along the frontier would be consistently uphill and against strong defenses.

Initial Operations.—At the time of Italy's entry into the war the Austrians had joined with the Germans in highly successful operations against the Russians, and for the time being they elected to pursue these operations and to maintain a purely defensive posture on the Italian front. The Austrian chief of staff, Field Marshal Count Franz Conrad von Hötzendorf (generally referred to as Conrad) had assembled 14 divisions on the Italian front. In addition, although Germany and Italy were not then at war, the Germans had provided their *Alpenkorps* (a crack mountain unit of about division strength) for employment in the mountains of the Trentino. The Italian commander, Gen. (later Marshal) Count Luigi Cadorna, had at his disposal 35 divisions. This would seem to indicate a better than two-to-one superiority over the Austrians, but since the training, equipment, and artillery of the Italian troops were not complete and the Austrians occupied extremely strong defensive positions, the combat strength of the two opponents was approximately equal.

On the first day of war, Cadorna launched a general offensive along the entire front. His First Army struck the nose and southeastern face of the Trentino salient as the Fourth Army attacked the northeastern face, hoping to break through to the railroad and cut off the Austrians in the Trentino. The Fourth Army would then advance eastward down the valley of the Drava River, join the Carnic Corps as the latter broke through on its front, and move toward Villach. Meanwhile, the Second Army would capture Caporetto and its environs, and the Third Army would advance to the Isonzo between Gradisca and Montfalcone. It was an ambitious enterprise, but the 23 divisions allotted to the three principal offensive armies were not sufficient to accomplish the many tasks assigned. Nevertheless, by June 16, when the initial operations were halted, significant gains had been made up to the Austrian line of resistance *à outrance*, and the Italian positions for subsequent tactical operations had been greatly improved. "It had become clear, however, that the war on the Austro-Italian front was to be a war of deliberate siege of strong defenses and of bloody attrition. The Italians now paused to complete their mobilization, move additional troops to the front, and prepare for a new drive. As the Italian official account stated . . . the strengthened barrier which the enemy has prepared with skill and feverish activity against our irruption will require a series of attempts to wrest the strengthened positions, beginning on June 23 with the first battle of the Isonzo."

First Four Battles of the Isonzo.—On June 23, 1915, the Italians began the First Battle of the Isonzo, which lasted until July 7. It was followed in rapid succession by the Second Battle (July 18–August 3), the Third (October 18–

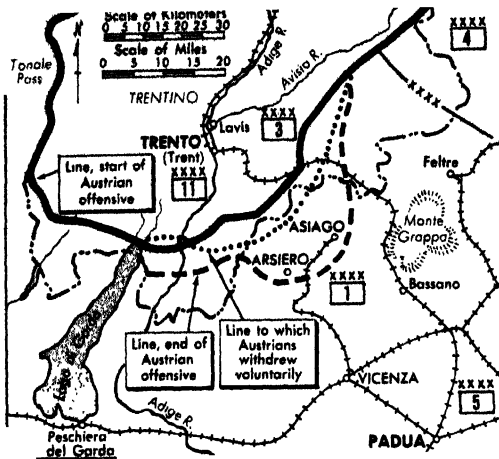

INITIAL ITALIAN OPERATIONS AND THE BATTLES OF THE ISONZO (May 1915–Sept. 1917). When Italy entered the war, the Austrians, fully occupied elsewhere, assumed a purely defensive attitude on the Italian front. The Italians immediately launched a general offensive to improve their tactical positions, pending full mobilization. The shaded areas on the map indicate the gains made during this offensive. The nature of the terrain along the Italo-Austrian border was such that the only sector in which the Italians could hope for decisive results was the difficult Isonzo River area, to the east. Eleven offensives (First to Eleventh Battles of the Isonzo) were launched against the Austrians during the period June 1915–September 1917. Territorial gains were meager: the dotted line shows the extent of gains made during the first 4 offensives; the dashed line, the overall gains in the 11 offensives. The net results of these costly battles of attrition were the development of a war weariness in the Italian forces and the wearing down of the Austrians to a state of near collapse.

November 3), and the Fourth (November 10–December 2). These battles were attempts by the Italians to break through the strong Austrian defensive positions from south of Tolmino (Tolmein; now Tolmin) to the sea, the major efforts being made in the Gorizia area and against the Carso Plateau. Lacking heavy artillery, blocked by stubborn defenders in well-prepared positions, and plagued by heavy autumn rains and winter cold, the Italians paid dearly for the small gains they scored. Courage and untold sacrifices had abounded, and the Italian infantry won the admiration of the enemy. In fact, one may read in the Austrian military report on the war: "The front-line official reports are emphatic on the magnificent valor of the Italian infantry and particularly on the conduct of its officers in the field." It should be mentioned that the Italian officers were of the educated classes, while the troops were drawn from the masses of peasants and workers with whom the former had had little contact. The rapport established between these divergent groups by the common struggle and by common sacrifices proved to be one of the great revelations of the war.

Fifth Battle of the Isonzo.—By the end of 1915, Italian losses had aggregated 66,000 men killed, 190,000 wounded, and 22,500 taken prisoner; Austrian casualties had totaled about 165,000. The Italian Army was close to exhaustion, but the Austrians were fortunately not aware

of its state. Meanwhile, Austrian strength on the front had been increased to 22 divisions. During January and February 1916, demands for operations in Albania and rescue work for the Serbs served to accentuate the poor condition of the Italian forces. When the Germans launched their determined attack against Verdun in February, Marshal Joseph Joffre urged Italian diversionary aid by means of an attack on the Isonzo front. Cadorna responded with a hastily prepared offensive: the Fifth Battle of the Isonzo (March 9–17, 1916). Directed to the north and south of Gorizia, the offensive bogged down in fog, rain, and snow, and served only further to exhaust the Italian troops. Cadorna, learning of an impending Austrian attack from the Trentino, halted the offensive and prepared to meet the new threat.

Austrian Asiago Offensive (May 15–June 17, 1916).—Since his days as a young officer, Conrad had considered an attack from the Trentino as the best method of defeating the Italians. Now he believed the time ripe for such an offensive. German aid was requested, but Gen. Erich von Falkenhayn, understanding better than Conrad did the implications of large-scale operations in the Trentino, refused the Austrian request. Nevertheless, Conrad decided to proceed with his *Strafe* (punishment) expedition with the forces available—14 divisions and 4 *Kaiserjäger* regiments, which had replaced the German *Alpen-*

AUSTRIAN ASIAGO OFFENSIVE (May 15–June 17, 1916). The Austrians attempted to get behind the Italian main forces on the Isonzo front by an offensive from the Trentino to capture the key rail center of Padua. Difficult terrain, lack of strength, and the timely shifting of Italian forces from the Isonzo front over the excellent rail net in northern Italy all joined to stop the Austrian attack. In June a successful Russian offensive in Galicia (Brusilov offensive) caused the Austrians to dispatch forces from the Trentino and to assume a strictly defensive attitude on the Asiago front.

korps in October 1915. He planned to compensate for his deficiency in troops by assembling huge quantities of medium and heavy artillery.

The objective of the offensive was to drive into the northern Italian plain, capture the key rail center of Padua (Padova), and thus effectively cut off the Italian Carnic and Isonzo forces. The commander of the Italian First Army on the Trentino front, Gen. Roberto Brusati, had been instructed to organize a position in depth to hold off any Austrian offensive moves there. Instead, he engaged in interminable local actions to improve his position, so that when the Austrian blow fell on May 15, 1916, he was caught off balance. Conrad's offensive made good initial gains and captured Arsiero and Asiago, gateways to the northern plain. Here the momentum of the attack declined because of lack of strength, difficult terrain, and the resistance of Italian reinforcements transferred from the Isonzo front. Under the pressure of an Italian counteroffensive and the necessity to shift troops to Galicia, where a Russian attack was impending, Conrad drew his forces back almost to their original positions in the Trentino. The Asiago offensive ended on June 17: Conrad's pet scheme had been tried and found wanting. Losses on each side totaled about 100,000.

Sixth to Eleventh Battles of the Isonzo.—After the failure of the Austrian Asiago offensive, Cadorna rapidly began to return his troops by rail and motor to the Isonzo front. The Austrians, who had to move from the Trentino over a longer, less efficient route, were at a disadvantage. As a result, when Cadorna launched the Sixth Battle of the Isonzo (also known as the Battle of Gorizia; Aug. 6–17, 1916), his operations met with immediate success. Both Gorizia and the bastion of Monte San Michele, dominating the northern section of the Carso, were captured. Threatened now from the north, the Austrians on the Carso fell back. Stiffening resistance

and the lack of adequate reserve to force a real breakthrough, however, brought the offensive to a halt. This battle had given the Italians their first real gains of the war; nevertheless, nothing decisive had been achieved.

Subsequent Italian military actions took on political aims to aggravate the "moral crisis" of the Dual Monarchy through a relentless wearing down of its forces that might eventually lead to internal collapse. Since Austria considered the retention of Trieste (Triest) vital, the Italians saw in the capture of that Adriatic city the opening wedge toward the downfall of the Habsburg Empire. The plan was to reach the city, which lay only 30 miles behind the front, by a succession of well-timed, energetic, limited-objective attacks punctuated by well-planned respite to prevent unnecessary losses, thus approaching the major objective by bounds. To this end the Seventh (September 14–17), Eighth (October 10–12), and Ninth (November 1–4) battles of the Isonzo were initiated. The theory was sound, but in practice (and in large part due to the growing insufficiency of artillery) the attacks developed into the same drawn-out and bloody affairs that had formerly characterized fighting on that front. Notable local successes were achieved, but not much progress was made toward the larger goal. The three offensives did disturb the Austrian commander on the Isonzo front, Gen. (later Field Marshal) Baron Svetozar Boroević von Bojna, who requested reinforcements, adding, "The last three battles have shown that the enemy has learned his lessons well and is taking advantage of all past experience in utilizing to the full modern techniques of war." For the Italian soldiers, who knew little of the tremendous strain under which the Austrians were operating, however, these battles seemed disproportionate in terms of results and sacrifices, of victories and losses, and of the means employed and the results attained.

Efforts to refurbish the Italian Army in the autumn of 1916 and the succeeding winter brought imposing results. A total of 16 new divisions were put in the field, and 6 additional divisions were being made ready; medium artillery was doubled, and heavy artillery was increased fourfold; the number of machine guns which at the start of the war had been only 600 was brought to 8,200; a gigantic acceleration in the production of bombs was being spurred; and military aircraft, which had numbered 382 in 1915, were now increased to 3,860, with great improvements in speed, striking capacity, and logistical potential. Early in 1917, Cadorna felt confident enough to resume offensive operations. It had been agreed by the Allies that their efforts in the spring of 1917 would be coordinated. Accordingly, the British attacked at Arras on April 9, the French drove forward on the Aisne on April 16, and the Italians took the offensive in the Tenth Battle of the Isonzo on May 12. This offensive was planned as two coordinated flanking attacks, first against the Bainsizza barrier and later against the Carso. The operations developed into the same exasperating pattern as had the engagements of the preceding autumn. After great losses the battle was halted on May 28. On June 4, a surprise Austrian counterattack deprived the Italians of a number of hard-won positions; the battle ended on June 8.

Cadorna now turned to a limited offensive on the eastern face of the Trentino salient, between

the Valsugana (Suganatal) and Asiago, where he employed 12 divisions and 24 Alpine battalions on a 10-mile front. Under the misnomer of the Battle of the Ortigara, the engagement lasted from June 10 to 29. The battle turned into a Carso-like struggle of attrition waged at an altitude of 6,500 feet. There were initial and occasional brilliant successes, but no major results were attained, and Italian losses were enormous.

This might have been the moment to suspend operations to permit the troops to recoup their strength. The Allies kept pressing for a new offensive, however, and Cadorna was eager to gain a better defensive line, at least on the Isonzo. Concentrating on the river such a mass of men and matériel as had never been seen on that front (51 divisions with 5,200 pieces of artillery), he launched the Eleventh Battle of the Isonzo (August 19–September 12). The Second Army was to gain the Bainsizza Plateau, officially described as “a transitional objective and zone of maneuver opening the way to the capture of the Ternova [Tarnova] Plateau.” The Third Army was to attack the Carso and seize the dominating Hermada and the surrounding plateau. Diversionary actions were planned for the north as far as Tolmino.

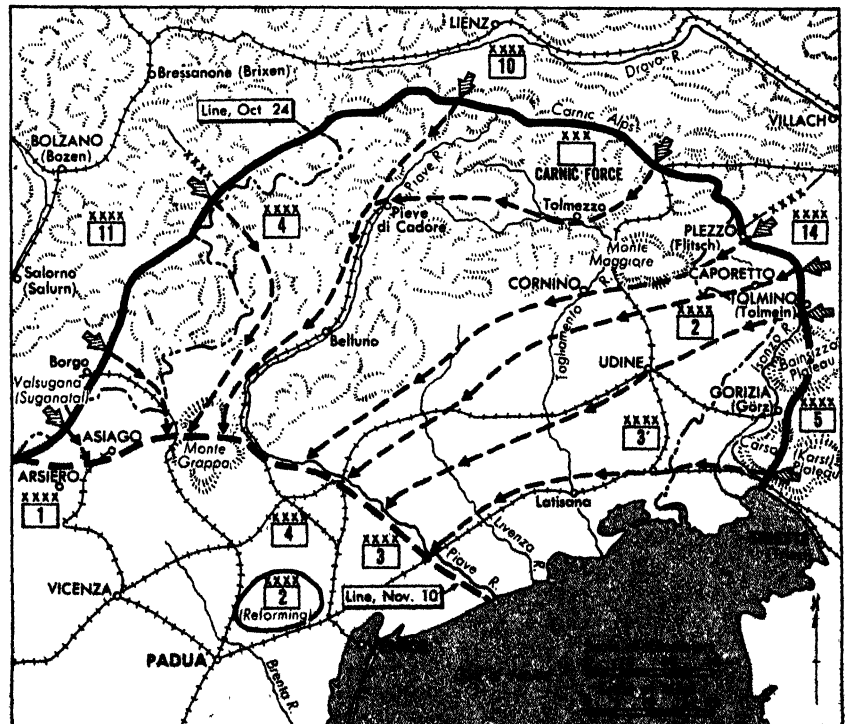

The Third Army attack came to nothing, and on September 4 a powerful Austrian counterattack hurled the Italians once again down the slopes of the Hermada. The Second Army attack failed in its principal purpose through the intransigence of its commander, Gen. Luigi Capello, who converted the diversionary action against Tolmino into the main attack and obstinately continued it even after it had failed. Since the reserve had been allotted for his use, it was lost to the general action. Instead of a single, coordinated offensive with alternating pressures and judicious use of the reserve, three

separate and distinct actions had resulted: at Tolmino, for the Bainsizza, and on the Carso.

The Italian offensives of 1917 had gained notable local tactical successes, including a five-mile penetration into the strongest Austrian defenses. Nevertheless, the pivotal points of the Austrian defense line remained in enemy hands: Tolmino, Monte San Gabriele, and the Hermada. Italian losses had been staggering; once again, and to a greater extent than ever, fatigue, weariness, and frustration gripped the Italian troops, making them prey to an unscrupulous neutralist and defeatist propaganda mercilessly exploited at home and abroad.

Battle of Caporetto (Oct. 24–Nov. 12, 1917).—After the Eleventh Battle of the Isonzo, the Austrians on that front were at the point of collapse and might well have succumbed to another offensive. Emperor Charles I now requested the replacement of Austro-Hungarian troops on the Russian and Rumanian fronts by Germans, so that he might throw the entire weight of his armed forces against the Italians. The German High Command felt, however, that the war would be decided on the western front. An offensive against Italy at this time would be justified only if it could definitely knock her out of the war; otherwise, it would merely lead the Austrians to abandon their present excellent defensive positions and perhaps necessitate redeployments to less favorable ones. Nevertheless, the Germans agreed to intervene on the Italian front with a limited number of crack troops fully supported by artillery, air forces, and logistical services. A quick resolute blow was envisioned that would throw the Italians back beyond the Isonzo and, if possible, behind the Tagliamento, in order to afford the Austrians some respite and time to prepare for a victory offensive at a future propitious moment. For this purpose the Austro-German

BATTLE OF CAPORETTO
(Oct. 24–Nov. 12, 1917). German troops were sent to the Isonzo front, and a combined Austro-German offensive was launched. Using new tactics, the Germans quickly shattered the front of the Italian Second Army, whose commander, even though apprised of the coming of offensive, had failed to take adequate defensive measures. The Italians were forced into a general withdrawal and succeeded in reorganizing on the line of the Piave River after suffering 320,000 casualties. This disastrous defeat, however, not only failed to demoralize the Italian troops and home front but engendered greater unity and determination to prosecute and win the war.

Fourteenth Army was organized from seven German divisions (including the powerful *Alpenkorps*) and eight Austrian divisions. Gen. Otto von Below, of western front fame, was given its command.

By September 18, Cadorna had become convinced that an Austro-German offensive was impending on the Isonzo. On that date he ordered his Second Army (General Capello) and Third Army (Emmanuel Philibert, duke of Aosta) to assume defensive positions in depth and brace for attack. Having issued the order, he took no measures to supervise its execution, as is incumbent on a commander in chief, nor did he issue any directive for the defensive battle. Meanwhile, the offensive-minded Capello dreamed of a counteroffensive in the Tolmino area and neglected to prepare his defensive position. Cadorna, who spent the time until October 19 inspecting other fronts, was generally out of touch with the activities of his forces on the Isonzo. When he and Capello finally bestirred themselves to reinforce the left flank of the Second Army, it was too late.

Before dawn on Oct. 24, 1917, an intense and effective bombardment fell on the Italian lines. First gas and then high-explosive shells were used. The Italian gas masks offered little protection against the gas, and panic seized the troops. At 8 A.M., the Fourteenth Army moved forward on a line from Tolmino to Plezzo (Flitsch; now Bovec), concealed by a heavy mist that blanketed observation from the heights. Capello had 25 divisions with which to oppose von Below's 15 divisions, but they were under strength, poorly distributed, and in inadequate defensive positions. Using their new tactics of infiltration and relentless pressure, the Germans shattered the front of the Second Army. By evening of October 25, it was clear that a retreat was imperative; Cadorna did not issue the order until October 27, thereby losing two precious days. It was anticipated that at least a temporary stand would be made behind the Tagliamento, but when the enemy crossed the river near Cornino to the north the Tagliamento position became untenable. On November 4, Cadorna ordered a further withdrawal to the Piave. Many troops had been cut off, particularly those of the Carnic Corps, but the Isonzo forces, covered by an excellent cavalry rear guard, reached the strong line of the Piave by November 10. This Caporetto disaster (sometimes called the Twelfth Battle of the Isonzo) cost the Italians 320,000 casualties in killed, wounded, and prisoners and several thousand guns.

Meanwhile, General Cadorna was replaced by Gen. (later Marshal) Armando Diaz. The line of the Piave was organized with the Fourth Army on the left and the Third on the right, while the broken Second Army attempted to reorganize in the rear. A force of 11 Anglo-French divisions, hastily rushed from the western front to Italy, constituted a general reserve, which Cadorna had so sadly neglected. Of the 65 Italian divisions available prior to Caporetto, only 33 divisions were now at full efficiency (4 or 5 others were still partially serviceable). Pitted against them were 50 Austro-German divisions and 4,500 cannon. As the so-called law of Clausewitz (originated by the Prussian Karl von Clausewitz) had foreseen, however, the Austro-German offensive had been reduced in power as it advanced in space. The very speed of the advance had out-

stripped the capacity of the bridge engineers and other essential logistical services.

The Austro-German forces persisted in their efforts to force crossings of the Piave and destroy the Italian Army until December 26, but they were consistently repulsed. Particularly fierce attacks were thrown against stubborn Italian defenders on Monte Grappa but to no avail. Regarding the fight on the Grappa, Gen. Konrad Krafft von Dellmensingen, German chief of staff of the Fourteenth Army, later wrote: "Thus our offensive was brought to a standstill short of its objectives, an offensive which had been so rich in expectations and hopes, and the Grappa became the 'Sacred Mountain' of the Italians. They can be rightly proud that they held it against the heroic efforts of the best troops of both the Austro-Hungarian Army and their German comrades."

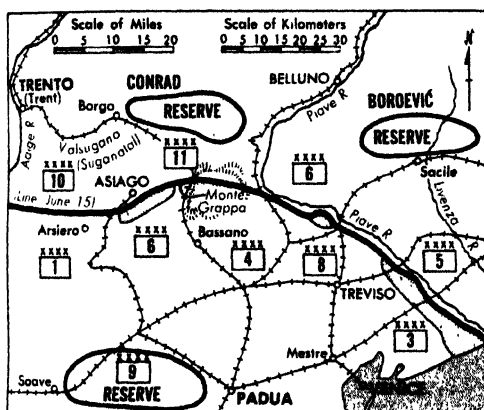

The resurgence of the Italian Army and the home front after Caporetto was truly remarkable. The disaster strengthened the determination of the Italian people; the entire nation at last began to support the war effort. In a few months industry replaced all of the artillery matériel losses, and the supply of munitions was considerably increased. The army proved to be still sound, and during the winter of 1917-1918 it further recovered its strength with marvelous speed. The place of the Second Army was taken by the Fifth Army, which for the moment at least served as the chief reserve of the supreme command. In the meantime, measures were taken to minister to the physical needs and restore the battered morale of the Italian soldier. General Diaz possessed a more humane sense of the soldier's life than Cadorna did, for under the uniform he saw the man and the citizen. New organizational methods for defense and offensive were developed which sought maximum results with a minimum loss of life. Greater emphasis was placed on the use of airpower, intelligence and information services were overhauled, and a central agency was formed to engage in counterpropaganda against the enemy.

There was one other important result of the Caporetto affair. High Allied officials gathered in conference at Rapallo and agreed to form an Allied Supreme War Council to coordinate the activities in all the theaters. This was the first step toward Allied unified command, which eventually materialized under Gen. (later Marshal) Ferdinand Foch.

Battle of the Piave (June 15-24, 1918).—In the spring of 1918 the Germans began a series of five drives on the western front designed to win the war before American forces could effectively intervene. Locked in a death struggle, each side asked its ally on the Austro-Italian front to attack. The Germans urged an all-out Austrian attack to drive Italy from the war, so that Austrian troops could be transferred to the western front (the 7 German divisions in Italy had already been shifted); Foch wanted an Italian offensive on the Trentino front to circumvent such a move. In March, 6 of the 11 Anglo-French divisions in Italy were sent back to the western front; the remainder moved to the mountains of the Trentino front in preparation for an offensive there. In April, 2 Italian divisions went to France. Diaz saw no advantage in an offensive against the Trentino and vetoed the idea; the Austrians proceeded to attack.

In all, 58 Austro-Hungarian divisions were assembled for the drive; Diaz had 57, including the 5 Anglo-French divisions. Conrad, demoted after his abortive Asiago offensive, commanded in the Trentino; Borojević, on the Piave front. Because of conflicts of personality and inadequate lateral communications, the Austrian forces, including reserves, were divided almost equally between the two sectors, thus denying the possibility of a concentrated effort anywhere on the front. On June 13, a diversionary effort was launched at Tonale Pass to the west of the Trentino; on June 15, the main attack began. By evening minor gains had been made in the Trentino, but these were wiped out by counterattacks and heavy artillery fire on the next day. Borojević had better initial success in the Piave River sector. Crossings were effected at three points; at one an advance of three miles was made. For eight days the Austrians and Italians struggled fiercely in attack and counterattack. Aircraft and artillery struck at the Austrian floating bridges, and the Piave rose sharply to further threaten their destruction. With supplies and ammunition beginning to run out and harassed by Italian counterattacks, Borojević ordered his troops back across the Piave on the night of June 22-23; the movement was completed on June 24.

BATTLE OF THE PIAVE (June 15-24, 1918). In June 1918, after the failure of their first three drives on the western front, the Germans were in desperate need of manpower. They therefore urged the Austrians to attack to put Italy out of the war, so that Austrian troops could be sent to the western front. The Austrian offensive against the Italian position on the Piave failed because of the dispersion of effort and the well-planned Italian defense.

Foch, who on July 1, 1918, had become supreme commander of all Allied forces, urged Diaz to exploit this victory and to launch a general offensive in coordination with an Allied offensive against the Soissons salient on the western front, scheduled for mid-July. He judged the Austro-Hungarian Army to be in a state of collapse and ripe for a final push, but Diaz and his principal aide, Gen. (later Marshal) Pietro Badoglio, thought otherwise. Diaz pointed to the Austrian failure in the river operations and was doubtful of Italian success in repeating the venture in reverse, particularly with his armies in their present state, for the Battle of the Piave had been hard fought. He preferred to reorganize, re-equip, and launch a deliberate offensive when he was fully prepared.

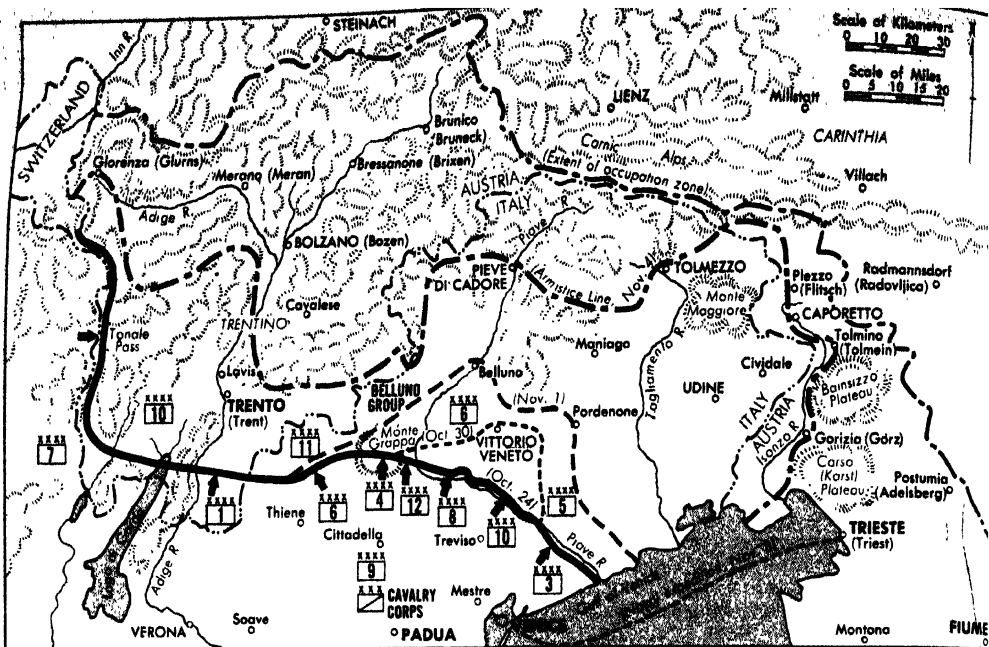

U.S. Navy

Austro-Hungarian troops go over the top as they launch attack in the Battle of the Piave (June 15-24, 1918).

Battle of Vittorio Veneto (Oct. 24-Nov. 4, 1918).—For his final offensive, Diaz had 57 divisions (51 Italian, 3 British, 2 French, and 1 Czechoslovakian, plus the United States 332d Infantry Regiment), and his artillery numbered 7,700 guns. Opposing him were 58 divisions and 6,000 guns. The main attack of the offensive was to be made in the center by the Eighth Army of 14 Italian divisions under Gen. (later Marshal) Enrico Caviglia, supported on the right by the Tenth Army of 2 British and 2 Italian divisions under British Lt. Gen. (later Field Marshal) the 10th earl of Cavan, and on the left by the Twelfth Army of 1 French and 3 Italian divisions under French Gen. Jean César Graziani. The plan was subsequently changed so that the Fourth Army (on the left of the Twelfth) would make the initial attack of the offensive on the massif of the Grappa in order to draw the Austrian reserves away from the front of the main attack. The ultimate object of the offensive was to split the Austrian armies and roll them up on the flanks. On the morning of Oct. 24, 1918, Diaz launched his offensive.

Meanwhile, the Allied final offensive on the western front was making good progress, and the Germans were withdrawing under great pressure. Convinced of eventual defeat, the German Reichstag had signified on October 20 its acceptance of President Woodrow Wilson's Fourteen Points as part of a basis for an armistice. Earlier, on October 4, the Austrians had appealed to the president and had begun to assemble an armistice commission.

If the political leaders of the Central Powers were in a mood for an armistice and peace, this attitude was not as yet reflected at the fighting front on the Piave. For three days the Austrians resisted the attacks of the Italian Fourth Army on the Grappa in a fierce, determined manner reminiscent of the early battles of the Isonzo. Territorial gains were minimal on both sides, but the Fourth Army succeeded in its objective of attracting the Austrian reserves from the front of the main attack. In the meantime, the Eighth, Tenth, and Twelfth armies began crossing the Piave on their fronts. By October 27, Italian, French, and British contingents had established three small bridgeheads, but until noon of October 28 the situation appeared to be grave all along

BATTLE OF VITTORIO VENETO (Oct. 24–Nov. 4, 1918). The Italians made great preparations for a final offensive to defeat the Austrians. In October 1918, as Marshal Ferdinand Foch's general offensive on the western front pushed back the Germans, the Italians launched their all-out offensive. The main attack, made by their Eighth and Tenth armies, penetrated the enemy position, and the Austrians broke. The Cavalry Corps, held in readiness for the purpose, rushed through the breach to exploit the success. By November 4, when an armistice became effective, approximately 500,000 Austrians had been taken prisoner.

the line. On the afternoon of that day, however, the situation changed: part of the Eighth Army broke through over bridges opened by the Tenth Army and advanced toward Monticano. At that moment the Austrian Sixth Army, on the Italian Eighth Army front, received orders to retire to its second line of defense. October 29 proved to be the day of decision, as Austrian resistance began

to falter before the determined advance of the three central armies. In some places the Austro-Hungarians stood their ground fiercely, in others they made a half-hearted stand, and in still other sectors they crumbled. The real dissolution occurred among the Austrian reserves; some refused to counterattack, while others mutinied.

The final collapse began on the night of October 30–31, when the struggle turned into a series of isolated encounters, of Austrian units cut off, pursued, captured, and overtaken by advance troops. In these operations after the breakthrough the Italian Cavalry Corps played a splendid role. On the afternoon of November 3, Trento was occupied, and a few hours later a naval expedition landed Italian *Bersaglieri* at Trieste. In the early evening the armistice was signed at Villa Giusti, near Padua. Approximately 500,000 Austro-Hungarian prisoners were taken in this final Italian offensive.

General Commentary.—The political and psychological crisis which had gripped the Austro-Hungarian Army in the final phase of the war should not obscure the fact that the Italian victory was the result of more than three years of arduous struggle which had cost the lives of 650,000 Italian troops and the maiming of almost 1,000,000 others. Moreover, the Italian contribution was not limited to the Austro-Hungarian front. The Italian 2d Army Corps was sent to the western front, where it participated with distinction in the Second Battle of the Marne. Approximately 100,000 Italian workers were employed in French war industries; at the same time, they constituted the manpower pool from which the ranks of the 2d Corps were replenished. An Italian division of 35,000 men fought with the Allied Salonika armies in Macedonia, and five

The first American troops to serve in Italy arrive in camp near the Austrian front in September 1918.

U.S. War Dept. General Staff

Italian divisions were engaged in Albania. Italy mobilized a greater percentage of her male citizens than did any other Allied nation except France.

The activities of the Italian Army had been fully supported by those of the Italian Navy. Though the Italian Fleet was superior to that of the Austrians in many respects, it operated under the handicap of a lack of adequate bases on the Italian side of the Adriatic Sea, while the Austrians possessed numerous excellent and strongly defended ports on their side. Nevertheless, the Austro-Hungarian Navy, except for occasional minor sorties and raids, was kept virtually bottled up within its well-protected harbors. An especially arduous and valiant feat performed by the Italian Navy was the rescue of the bulk of the Serbian Army, which had been driven from its homeland by an overwhelming German-Austrian-Bulgarian offensive to the coast of Albania, on the Adriatic. Faced by continual threats from nearby major Austrian naval bases, the Italian Fleet transported in safety to Corfu 260,895 men, 10,153 horses and other animal stock, 68 cannon, and much equipment during the period Nov. 22, 1915-March 4, 1916.

Professor of History, University of Turin.

10. Colonial and Japanese Campaigns

In 1914, Germany possessed a vast colonial empire with territories in Africa, Asia, and the Pacific. Its area exceeded 1,000,000 square miles, and its population was about 15,000,000. Less than 25,000 of the inhabitants of the various colonies were German nationals, and these were mostly administrators and settlers. In Africa the colonies were Togoland, Kamerun (Cameroons), German Southwest Africa, and German East Africa (Tanganyika); in Asia, Kiaochow, a protectorate in China's Shantung Province; and in the Pacific, the Bismarck Archipelago, Western Samoa, Kaiser-Wilhelmsland (northeastern New Guinea), the Caroline, Marshall, and Mariana Islands (except Guam, a United States possession), and part of the Solomon Islands. Although the eventual fate of these colonies would depend on the outcome of the war in Europe, the Allies could not allow them to remain unmolested, for they provided excellent bases for German warships and commerce raiders and had long-range wireless communications systems. The Germans had a grand plan for the mastery of Central Africa from coast to coast, including the Belgian and Portuguese possessions. This aim was to be furthered as the fortunes of war in Europe permitted.

The nature of the military campaigns in Africa differed sharply from those in other areas. Roads and trails were few and poor; whenever possible, operations were conducted either along the rivers, receiving their support by boat, or along the few railroad lines. Logistical support of overland operations was provided primarily by native carriers, who generally far outnumbered the combat troops they supported. (The tsetse fly abounded in many areas and quickly killed any transport animals or cattle brought in.) The military forces on both sides consisted chiefly of trained natives formed into companies officered

by Europeans, with, on occasion, a leavening of white units. Native police forces of the German colonies had received some military training and were employed at times. Advances were of necessity difficult and slow, the relatively small forces operating in the vast tropical areas could evade each other easily, and disease killed and incapacitated far more combatants and carriers than battle did.

German possessions in Africa in 1914.

Togoland.—Togoland (now divided between Ghana and the Republic of Togo) had a maximum width of 90 miles and extended inland for 330 miles from the Gulf of Guinea. About 100 miles from the coast the Germans had installed a powerful wireless station that gathered information from the other German African colonies and relayed it to Berlin. On Aug. 7, 1914, British and French forces attacked Togoland from the west and east, respectively. The small garrison of 200 Germans and about 1,000 native troops withdrew before the advancing Allied forces toward the wireless station at Kamina, where, on August 26, it was penned in and surrendered after destroying the wireless facilities. A Franco-British administration was set up, and in a few weeks normal peace conditions again prevailed.

Cameroons.—The Cameroons (now divided between the Republic of Cameroun and Nigeria) occupied 200,881 square miles in the Gulf of Guinea. Inland the country consists mostly of forest, bush, and grassland, with a hilly area in the north. The coastal strip, with its mangrove swamps and heavy rainfall, was among the most pestilent areas in Africa. On August 20, two French columns (including a Belgian contingent) entered the Cameroons from the southeast, beginning a trek that was to extend for more than 300 miles through desolate and forbidding territory; and between August 25 and August 27, three British columns crossed the Nigerian-Cameroons border. After modest initial gains, German counterattacks in early September forced the British

back across the border in great disorder. The complete failure of the attack is attributed to inadequate preparations, topographical ignorance, and the rainy season then in progress.

A Franco-British naval-military expedition up the Wouri River was now organized. Better prepared, it met with greater success than the land attack. On September 27, Douala (now Douala), 20 miles up the river, was captured, although most of its garrison escaped. The Allies pursued the Germans to Edéa, 35 miles to the southeast, which they occupied on October 26. After an unsuccessful counterattack on Edéa, the main German forces withdrew toward Yaunde (now Yaoundé), 100 miles to the east, where their munitions facilities were located. It was their plan to hold out on this high ground until the soon-expected German victory in Europe.

The Allied plan was to converge on Yaunde from all directions, but it was to be more than a year before they reached the town. The advance was conducted under the most demoralizing conditions. Swamps, forests, and tropical heat impeded progress; columns had to travel great distances without transportation and communications; small German detachments harassed the troops in guerrilla operations, and hostile natives set up ambushes, making it necessary to build and garrison blockhouses every 20 miles; the rainy season intervened to halt the advance completely for a long period; and tropical diseases, principally dysentery, thinned the Allied ranks. On Jan. 1, 1916, the British entered Yaunde from the north, only to find the town evacuated; the German forces had begun a 125-mile march to neutral Spanish Guinea in the south. Efforts to cut them off failed, and they were interned safely by the Spaniards. Oddly enough, marching and fighting far apart and without communications for almost a year and a half, the Allied columns converged on their objective, Yaunde, within a few days of each other. By mid-February 1916, the last of the small isolated garrisons had been captured. White prisoners were sent to England, and natives to their homes. A joint Franco-British administration was established.

The maximum German strength in the Cameroons reached 8,000 white and native troops; in the final advance the Allies employed 24,000 troops (10,000 French, 8,000 British, and 6,000 Belgian), in addition to 40,000 native carriers. Battle losses were small on both sides; disease exacted the major toll, particularly among the native carriers.

German Southwest Africa.—German Southwest Africa (now South West Africa) covers 317,725 square miles on the Atlantic coast of the continent. Primarily desert and bush, it has few rivers and meager rainfall. In 1914 it had a population of about 15,000 whites and 100,000 natives, chiefly Hottentots, Bushmen, and Bantu. Most European powers had shown little interest in the area, although the British occupied the fine port of Walvis Bay and annexed it to Cape Colony in 1878, and Germany took over the territory in 1884 primarily because it would look imposing on the map. Later the territory was found to be rich in minerals, particularly diamonds. Railroads ran several hundred miles inland from the German ports of Swakopmund and Lüderitz. The capital, Windhuk (now Windhoek), lay 170 miles inland on high ground. There a powerful wireless station had been installed.

Allied operations against the German colony were assigned to the troops of the Union of South Africa. Originally, it was intended only to capture the German ports to prevent the supply of naval surface raiders. On September 12, Lüderitz was captured, but further operations were brought to a halt by the defection of two of the South African military leaders, Brig. Gen. Christian F. Beyers and Lt. Col. Solomon G. Maritz. Beyers fanned the smoldering disaffection among segments of the Afrikaners, and Maritz joined the Germans, threatening an invasion of South Africa. Approximately 30,000 troops were needed to quell the widespread uprisings. Then, in January 1915, operations in German Southwest Africa were resumed with vigor under Gen. Louis Botha. A force of 20,000 men, which Botha commanded personally, landed at Swakopmund and proceeded toward Windhuk; one of 25,000 advanced inland from Lüderitz; another of 8,000 moved in from the south; and a fourth of 2,000 crossed the eastern border. More than half of the troops were mounted. Logistical support presented great problems, for all supplies and much of the water had to be brought from Cape Town and conveyed inland by oxcarts, mule wagons, and automobiles. Large groups of natives were employed day and night to shovel shifting sand from the railroads. All of the native tribes united with an eager desire to help the South African troops against their former masters. They were not permitted to fight, but were employed as scouts and transport drivers.

The advance was slow but inexorable. Once driven from the railroads, the hopelessly outnumbered Germans were forced to flee, for they could not establish defensive positions in the desert wastes. On July 1, 1915, they made a final stand at Otavi, at the end of the railroad. Cut off from further retreat to the north by Botha's cavalry, 3,500 Germans surrendered unconditionally on July 9 (1,500 others had been captured previously). The Union of South Africa was assigned the administration of the territory.

German East Africa.—German East Africa (now Tanganyika), the greatest and richest of the German colonies, covers 361,800 square miles. Its western border is mountainous; lakes abound in the west, and rivers in the east. In 1914 the colony was sparsely settled by a population of about 8,000,000, including 5,500 whites. The road net was fair by tropical standards, but few roads were fit for motor transportation. One railroad traversed the middle of the territory, and another joined the port of Tanga with the key base of Moshi.

The German garrison, initially small, never exceeded 3,500 white and 12,000 native troops even when augmented. It was commanded by Lt. Col. (later Maj. Gen.) Paul von Lettow-Vorbeck, a determined and crafty leader. At the beginning of the war the British forces in the adjacent colonies were almost negligible. Since the forces of the Union of South Africa were occupied in conquering German Southwest Africa and in suppressing rebellion, a call was made for India to send troops. Meanwhile, the British enlisted whatever natives they could and assembled them to defend the vital Uganda Railway, which paralleled the border and in places was 50 miles from it.

Hostilities began on Aug. 8, 1914, when British landing parties destroyed the wireless station and floating dock at Dar es Salaam. Lettow

busied himself with border raids in Rhodesia while preparing for an invasion of British East Africa to the north. Indian troops arrived just in time to repel a German attempt against the Uganda Railway in September. In October, an advance against the key British coastal port of Mombasa was similarly halted. Additional Indian troops arrived in November and attempted to capture Tanga. A landing was made on November 2, but, constantly attacked and harassed by the Germans (and swarms of wild bees), the troops were forced to return to their ships on November 4 after suffering severe losses. Sporadic and indecisive fighting took place along the lakes and frontiers until the end of 1915. By then the British had been ejected from German territory, and Lettow held stretches of British East Africa, including a portion of the Uganda Railway north of Moshi.

The fall of German Southwest Africa in July 1915 had permitted the transfer of South African troops to the east, and in March 1916 the British, under Lt. Gen. Jan Christiaan Smuts, launched an offensive. The Germans were driven from the Uganda Railway on March 9, and four days later their base at Moshi was captured. Then followed a long series of operations designed to outflank and capture Lettow, in which Belgian troops from the Belgian Congo and Portuguese from Mozambique joined. Lettow proved elusive, however, and by the end of 1916 had fallen back south of the Rufiji River. It had become clear to Smuts that the Indian and white South African troops, highly vulnerable to disease and roadbound in their tactics, were unsuited to the prevailing guerrilla type of operations. They were replaced by Nigerian troops, who could better match Lettow's forces in bush fighting. In January 1917, Smuts left for an imperial conference in London and was succeeded by Maj. Gen. Sir Jacob Louis van Deventer, a South African. In July, when the rainy season ended, van Deventer took the offensive vigorously. Lettow's principal force of 5,000 troops was surprised and captured just south of the Rufiji on November 28. Meanwhile, Lettow and his remaining small force crossed into Mozambique. Portuguese and British troops pursued him down and up the length of Mozambique, then back into German East Africa, and finally into Northern Rhodesia—a distance of 1,600 miles. It was not until Nov. 25, 1918, almost two weeks after the armistice in East Africa, that Lettow surrendered his force of 1,300 men. It had been his plan to wend his way across Africa to Portuguese Angola.

Lettow's campaign in East Africa is a classic of guerrilla warfare. With only a handful of men, he kept 300,000 enemy troops busily engaged during most of the war at a cost to Britain alone of about \$350 million. He inflicted about 15,000 battle casualties, but casualties among Allied troops and transport followers caused by disease acquired in the pursuit totaled almost 700,000.

Kiaochow.—The German colony of Kiaochow occupied about 200 square miles on a sheltered bay in the Chinese Province of Shantung. The city of Tsingtao, at the head of the peninsula, was a naval station garrisoned by about 4,000 German marines, which had been developed into a strong fortress at a cost of \$100 million. Heavy guns covered the coast, and three strong and deep defensive zones, extending across the neck of the peninsula, guarded the base proper. Tsingtao's

excellent harbor made an ideal base for the German Far East Squadron, which sailed for the high seas at the outbreak of war in 1914. On August 15, Japan delivered an ultimatum to Germany, demanding the evacuation of Kiaochow. The Japanese declared war on August 23, and opened the campaign by occupying the islands outside the harbor four days later. On September 2, Japanese troops landed at Lungkow, 110 miles north of the fortress, with the object of isolating and attacking it from the landward side. Heavy rains thwarted this project, and the Japanese turned to aerial bombardment of ships in the harbor and military installations. On September 18, another landing was made, this time closer to the outer defense line. British forces from Hong Kong landed on the seaward side on September 23, and joined with the Japanese to form a cordon across the peninsula. Lacking sufficient troops to hold them, the Germans withdrew from the two forward positions; the British-Japanese forces followed to within 5 miles of Tsingtao. Noncombatants were permitted to leave the town on October 15, and were conducted through the Allied lines.

The Bettmann Archive

German marine artillery at Kiaochow, China, in 1914. Colony was surrendered to the Japanese on November 7.

The Japanese now began a relentless and deliberate advance, using the methods of regular siege warfare. On October 31, they opened a bombardment of the German defenses with heavy howitzers, while British and Japanese warships pounded key German defensive installations. By November 6, Japanese siege parallels had reached within 300 yards of the main German defenses. That night a general assault captured the last infantry redoubts, and early the next morning the Germans surrendered. They had suffered 700 casualties; the remainder of the 4,000 garrison troops were taken to Japan as prisoners. The Japanese had employed 23,000 troops, and the British 1,500; their casualties had been 1,800 and 70, respectively. Administration of the German colony was assigned to the Japanese, effective until the end of the war, when they were to open negotiations with China.

German Pacific Islands.—There were very few German nationals in the Pacific island colonies, and these were primarily civilians. Unable to be reinforced from the homeland, the islands were easy prey for Allied forces. The principal German possession in the Pacific was Kaiser-Wilhelmsland, situated in northeastern New Guinea. It covered 69,700 square miles and had a population of about 500,000, of whom 300 were Germans. The large number of German-held islands in the Bismarck Archipelago to the northeast, including Neu Pommern (New Britain), Neu Mecklenburg (New Ireland), Neu Lauenburg (Duke of York Islands), the Admiralty Islands, and Neu Hannover (Lavongai), were populated by 200,000 natives and 300 Chinese and Germans. The Solomon Islands to the east were partly German and partly British. The Western Samoa group (the other German South Sea possession) contained about 500 Europeans (chiefly British and German), 1,500 Chinese, and 15,000 natives. Farther out in the Pacific lay the Carolines, the Marshalls, and the German islands of the Marianas chain.

While Australian, British, and Japanese warships patrolled the Pacific hunting for German cruisers in 1914, Allied forces undertook the capture of the German islands. A New Zealand force of 1,500 landed at Apia on Upolu Island on August 29 and took possession of Western Samoa without opposition. On September 11, an Australian expeditionary force of 1,500 landed unopposed on Neu Pommern. It took possession of Kaiser-Wilhelmsland on September 17, and subsequently occupied the adjacent island groups. Meanwhile, the Japanese captured the outlying islands.

By the terms of the Treaty of Versailles, Germany was deprived of all her colonies. France and Great Britain were instructed to make a joint recommendation as to the future of Togoland and the Cameroons. Mandates for the rest of the colonies were apportioned as follows: German East Africa, Great Britain; German Southwest Africa, the Union of South Africa; Western Samoa, New Zealand; other former German Pacific possessions north of the equator (the Marshall, Caroline, and Marianas groups), Japan; other former German Pacific possessions south of the equator, Australia (Nauru, assigned to the British Empire, also was actually under Australian control).

of Military Art, United States Military Academy.

11. Turkish Campaigns

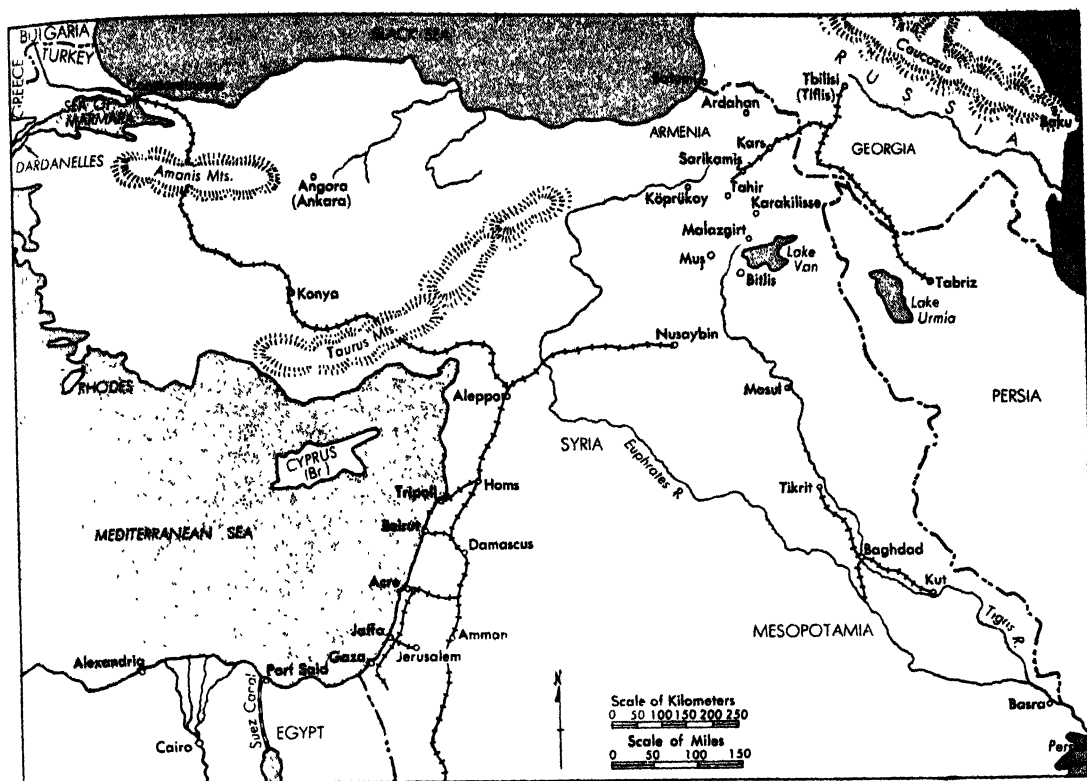

At the outbreak of World War I, Turkey was politically and militarily in a state of transition. The Young Turk regime was thoroughly established, but it was not united, nor had it recovered from the crushing defeat suffered in the Balkan Wars of 1912–1913. The army was being restored and rearmed by a German military mission. At the same time, Britain was endeavoring to carry out a similar task for the navy, with poor prospects by comparison, since whereas the army contained magnificent fighting material, the navy was largely antiquated. The division of sentiment in the Turkish government was represented by Ahmed Djemal Pasha, the navy minister, and Enver Pasha, the war minister. The

former was an old-fashioned Pan-Turk who was prepared to keep out of war if possible, though he was by no means as wholehearted in this resolve as the grand vizier, Mehmet Said Halim Pasha. Enver, on the other hand, had adopted and in part invented the creed of Pan-Turanism, which sought to embrace all speakers of Turanian (Ural-Altaic) languages, and he was indifferent to the fate of the Turkish possessions in the purely Arab countries. He was determined on war.

On Aug. 2, 1914, a secret treaty providing for the subsequent entry of Turkey into the war on the side of the Central Powers was signed with Germany. At the last moment, the government had misgivings because the forces of the Allies were making a better showing than had been expected, but Enver pressed for Turkish belligerency. In this he had the collaboration of German Vice Admiral Wilhelm A. T. Souchon, whose determination had enabled him to escape the powerful fleets of France and Britain in the Mediterranean Sea and to bring the battle cruiser *Goeben* and the light cruiser *Breslau* safely through the Dardanelles. The arrival of a modern battle cruiser at Constantinople (now Istanbul) transformed Turkey's naval position and threatened the Russian Black Sea Fleet, which included no warships of the dreadnought type nor any with the *Goeben's* speed. The two ships were nominally embodied in the Turkish Navy; and on October 29, Souchon led the combined fleet in the bombardment of the Black Sea ports of Novorossisk, Feodosiya, Sevastopol, and Odessa, thus ensuring war with Russia. Russia declared war on Turkey on November 1, and Britain and France followed suit on November 5.

Meanwhile, Turkey had mobilized 36 divisions by the end of September. The head of the German military mission, Gen. Otto Liman von Sanders, was a man of ability, energy, and integrity, and all the work which he was able to supervise was admirably done. The situation in Turkey's Arab possessions was another matter. The Baghdad Railway (q.v.) included great gaps, which were covered by execrable roads over which all supplies had to be borne because the tunnels through the Taurus and Amanos Mountains had not been pierced. Moreover, on the east side of the mountains the railway extended only halfway between Aleppo (Halab) and Mosul, the terminus being Ras el 'Ain. For these reasons, it was impossible to make nearly as good progress east of the Taurus as west of it. The garrison at Yemen, in southwestern Arabia at the southern extremity of the Ottoman Empire, seemed useless, although it actually proved a sharp thorn in the British flank by maintaining a siege of Aden throughout the war. The reinforcement of the Turkish garrison in Syria was paralleled and indeed proportionately exceeded by that of the British garrison in Egypt. The Regular infantry brigade and the regiment of cavalry stationed there at the beginning of the war were sent to fight in France, but they were replaced by two Indian and two British Territorial divisions under the command of Gen. Sir John Grenfell Maxwell, who had a long experience of the country.

Operations in the Caucasus, 1914.—Throughout the war the Caucasian theater was to a great extent divorced from the conflict at large and even from the main Russian front. The Turks were able to put their finest troops into the area, whereas the Russian High Command consistently drained it to fill gaps in other Russian theaters of

Turkish Empire in 1914.

operations. The area with which the Caucasian theater became most closely connected was the British theater of Mesopotamia, where a slender Russian spearhead joined it through Persia (Iran). While the Russians in Asia Minor created troops as good as all but the best that they lost, drawing them from such local peoples as the Armenians, in the beginning the odds favored the Turks, who could put into the field 150,000 men to the Russian 100,000, and those distinctly the better trained. The opposing armies were commanded by Hassan Izzet Pasha and General Myshlayevski.

On the Turkish side, however, Enver himself was the strategist, and Hassan Izzet the tactician who had to implement the minister's plans and remedy his errors, a task which proved beyond this hard-fighting and devoted man. Enver was a professional soldier, but he did not know how to conduct a campaign, although he saw himself as a Hannibal or a Napoleon. He could deduce from the map that everything depended on the roads, but he could not assess the handicaps. His aim was to draw the main body of the Russians forward and then by a lightning stroke put an overwhelmingly strong Turkish force between them and their main bases, Ardahan and Kars. By this means, he was confident that he could destroy the bulk of their Caucasian army and complete his victory by the invasion of Georgia, where the Turanian peoples would rise against Russia. Enver's plan might have succeeded in summer, but in midwinter the troops had to live on the country because their trains could not reach them through the heavy snow. Night temperatures regularly fell to

-20° F., and winds rose to gale force on the higher ground.

While Turkish forces in the Caucasian theater totaled 150,000 men, Hassan Izzet's army numbered only 95,000, although it was still in a proportion of three to two against Myshlayevski's. Both sides fought bravely, and death came swiftly and mercifully to the wounded. One Turkish division started its march 8,000 strong, and after four days in the mountains was reduced to 4,000 men. In the deployment phase of the campaign alone, Hassan Izzet lost 25,000 men from a combination of frost and desertion. The great Russian victory was won at Sarikamis, 33 miles southwest of Kars, between Dec. 29, 1914, and Jan. 2, 1915. By mid-January, the force of 95,000 Turks had fallen to 18,000. One brilliant soldier was revealed in the campaign. He was Nikolai Yudenich, who served as senior staff officer to Myshlayevski and was later in command of an army corps.

Beginning of the Campaign in Mesopotamia, October-November 1914.—British operations in Mesopotamia (now Iraq) during the war developed from a minor protective measure into a big and costly operation. At the end of September 1914, the India Office suggested that a reinforced brigade be sent to the head of the Persian Gulf. The main object of the expedition was to protect the installations of the Anglo-Persian Oil Company (later, Anglo-Iranian Oil Company) on Abadan Island, at the end of its pipeline. It was also expected to confirm the sheikhs of Kuwait and Mohammereh (now Khurramshahr) in their allegiance to Britain.

After the expedition reached Bahrain on Oc-

tober 23, the British government gave its approval to an advance to Basra (al-Basrah), which was suitable as a base. The city was taken on November 22 after relatively hard fighting in which British and Indian casualties were by far the heaviest of the year in Mesopotamia, totaling 489. Once the force had made a ceremonial entry into Basra and the Union Jack had been hoisted, a proclamation of extreme subtlety was read in Arabic by the chief political officer, Sir Percy Cox, later to become a figure of world celebrity.

OPERATIONS IN MESOPOTAMIA, 1914-1915. In December 1914, the British advanced northward from Basra. They seized Ahwaz in May 1915, thereby driving the Turks from the important oilfields and pipeline. In July, the Turks were ejected from Nasiriya. Maj. Gen. Charles V. F. Townshend, commanding the main British column, advanced along the Tigris River and seized 'Amara in June, Kut in September, and Al 'Aziziya in October. In November, he ran into the Turks entrenched at Ctesiphon and was badly defeated. He then retired to Kut; the Turks followed and besieged the city.

It must be recalled that Britain had treated Turkey in a spirit of friendship up to the moment when she was maneuvered into the war against the will of her wisest ministers, hoping to the last that she would succeed in maintaining her neutrality. This spirit was maintained in the proclamation, though it was addressed to Arals and Kurds:

Let it be known to all that from of old the British Government has had many millions of Mahomedan subjects, more than any other power in the world, more even than Turkey.

As is well known, Great Britain has in the past always displayed friendship and regard for Turkey; and a few months ago, when war broke out between certain of the powers of Europe, the British Government urged most strongly on the Sublime Porte that the Ottoman Government should on no account join in the conflict, as such a course was opposed to the best interests of Turkey. Furthermore, in this connection Turkey was assured that so long as she refrained from participation in the war the British Government and her allies would guarantee the maintenance of her independence and integrity. Unfortunately the Turkish Government did not accept or attend to the advice of the British Government in this regard, for the reason that she was misled and tricked by German intrigues to such an extent that she committed numerous acts of hostility which forced the British Government into a state of war with her.

The British Government has now occupied Basra, but though a state of war with the Ottoman Government still exists yet we have no enmity or ill-will against the population, to whom we hope to prove good friends and protectors. No remnant of Turkish administration now remains in this region. In place thereof the British flag has been established, under which you will enjoy

the benefits of liberty and justice, both in regard to your religions and your secular affairs.

The statements in the proclamation were very much to the point, but from another aspect the expedition was typical of the private wars initiated by the India Office and the Colonial Office, which barely consulted the War Office until they needed its help in extricating themselves from untenable situations. To some extent, this state of affairs endured throughout the war.

Operations in the Caucasus, 1915.—The peril of the invasion of Russian territory from Asia Minor, which had been averted at Sarikamis at the beginning of 1915, became even more pressing in the course of the year, especially after the Austro-German victory on the eastern front, which started with the Gorlice-Tarnow breakthrough. Turkey itself was not seriously engaged in other areas until the grip of the Gallipoli campaign began to be felt. The German staff at Constantinople reconstituted the shattered Turkish divisions and created new ones, and in the course of the year Turkish strength rose from 500,000 men in 40 divisions to a peak of 800,000 men in 52 divisions.

Meanwhile, the staff of the corps commanded by General Yudenich, relying on reports that were unconfirmed by strong fighting reconnaissance, estimated the strength of the Turks in the hills north of Lake Van as three or four divisions, whereas there were actually eight. Yudenich directed his subordinate, General Oganovski, to drive the enemy from the hills by a rapid advance. Not even the very strong resistance encountered warned Oganovski immediately of his danger, and when the warning came it was too late. The Turkish commander, Abdul Kerim Pasha, advanced with odds of three to one in his favor and caught the Russians just as they thought they had reached a refuge at Malazgirt, which covered the only north-south road for some miles. In his distraction, Oganovski submitted no adequate report, and Yudenich did not learn the full truth until he sent a staff officer to Malazgirt. Within a week the remnant of Oganovski's force was in flight, having lost all its artillery and transport. Enver ordered Abdul Kerim to drive the Russians across the frontier, but the latter suspected that his communications might be attacked and advanced with caution.

Though his resources were slender, Yudenich assured the viceroy in Tbilisi (Tiflis) that there was no cause for concern. The force that he was able to scrape together numbered little over 20,000, of whom a fair proportion were cavalrymen, and he assembled it between Köprükoy and Tahir, where the road to Karakilisse (now Karaköse), which the Turks had reached, branched off the main road to Kars. He placed this force under the command of Gen. N. N. Baratov and ordered him to drive across the enemy's lines of communication and sever them. The Turks hastily retreated, while Baratov's Cossacks captured a great number of guns and much food in the blocked streets of Karakilisse. The Turks were reported to have lost 10,000 killed and wounded, and they left 6,000 prisoners in Baratov's hands. It was a notable victory, but Yudenich lacked the means to exploit it.

Campaign in Southern Mesopotamia, 1914-1915.—The British force in Mesopotamia moved north from Basra and captured Al Qurna (al-Qurnah) on Dec. 9, 1914. It now received orders to take 'Amara ('Amarah), nearly 70 miles far-

ther up the Tigris. Moreover, whereas all the earlier operations had been conducted astride the Shatt-al-Arab or the Tigris, the force was now directed to secure Nasiriya (al-Nasiriyah) on the Euphrates River and Ahwaz on the Karun River and the pipeline. Although there were good arguments in favor of these fresh advances, they represented another instance of the policy of taking steps without any clear conception of where they were to lead, but giving the impression that they were designed to force the hand of the British government and induce it to attempt the capture of Baghdad. At this time, only 21 river steamers and tugs were available for operations.

Meanwhile, another brigade and supporting artillery had arrived in Mesopotamia, and it had been decided that a senior officer of the Indian Army, Gen. Sir John Nixon, should set up a corps headquarters to command the two infantry divisions and the cavalry brigade now in the country. The Turks were very weak on the Tigris, in contrast to their left wing of 8,000 men near Ahwaz and their right wing of 18,000 men on the Euphrates, which together constituted two divisions and a cavalry brigade, or exactly the strength of the total British force. The Turks' center consisted merely of a detachment of gendarmes, and their east-west communications, though much better in the drought of spring and summer than in the floods of winter, took some time to pass between the two wings.

Maj. Gen. (later Sir) Charles V. F. Townshend advanced up the Tigris and, after a series of minor operations, on June 3 seized Amara at small cost. The task of Maj. Gen. (later Sir) George F. Goringe proved more arduous. He suffered at least one sharp check and had some trouble in seizing Ahwaz, but the difficulties of his two months' advance were due almost entirely to lack of sufficient transport and grilling heat. Strategically, this was the most valuable operation since the original landing, because the enemy was driven from the oilfields, which were not threatened again during the war. Goringe went straight to the next undertaking and took only half as long to capture Nasiriya, which he occupied on July 25.

Advance on Kut, 1915.—It would have been well if Goringe, who was a steady, painstaking soldier, had been entrusted with the next venture, an advance up the Tigris to Kut (Kut al-Amarah). Townshend, the commander to whom it was allotted, was of a very different type. Already celebrated for his achievements in the North-West Frontier Province of India, he was very much a showman. He would be certain to support any form of forward policy and perhaps to move in advance of orders, as he can be said to have done when he pushed on from Kut, which he took on Sept. 28, 1915, to Al 'Aziziya (al-'Aziziyah). His force at this period was short of physicians and medical equipment, and as soon as it became engaged in the first heavy fighting of the campaign, the medical system broke down, and a great number of unnecessary deaths occurred.

Townshend reached Al 'Aziziya without difficulty on October 5, but then he was delayed by a fall in the depth of the Tigris. To supplement the river boats, a motley assortment of camels, horses, mules, and asses were assembled. Townshend had been forbidden by Nixon to advance any farther, but the British cabinet, anxious to regain popular support, which it was losing be-

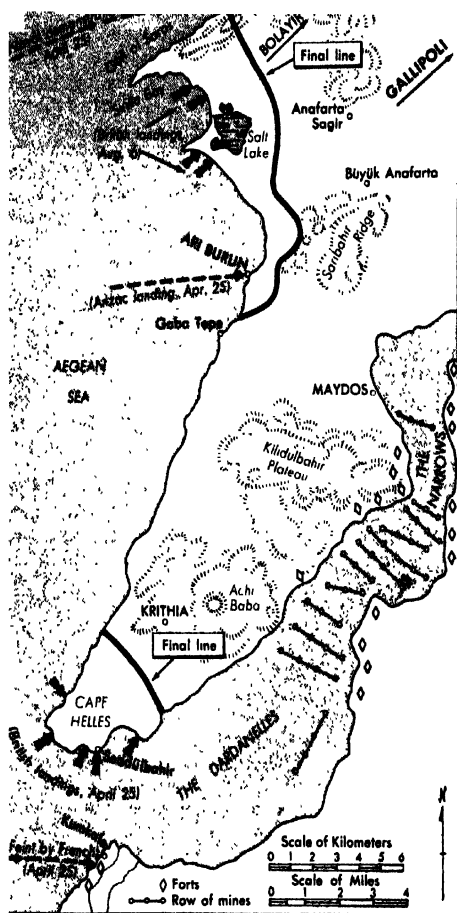

cause of the now inevitable collapse of the campaign in Gallipoli, on October 23 sent to the viceroy of India the following telegram: "Nixon may march on Baghdad if he is satisfied that the force he has available is sufficient for the operation." This put the blame for failure on Nixon, who was doubtful about the venture, and the credit for success on the government.

For the first time, the Indian troops, hitherto steady and reliable, showed signs of discouragement when they saw the heavily fortified position at Ctesiphon, only 20 miles southeast of Baghdad. The assault on November 22 was a complete failure and cost 4,500 casualties out of a total strength of 14,000. Townshend halted at Ctesiphon until his sick and wounded had been evacuated to Kut, but he followed them on December 3 and decided that he must stay there in view of the fatigue of his troops. He had a food supply which he reckoned would last two months and was confident of relief well within that time. The Turks soon followed Townshend and began the investment of Kut with the care which they always applied to siege warfare. It was small consolation that Baratov's Cossacks, sent by Grand Duke Nicholas to Persia after the victory of Karakilisse, had reached Hamadan on December 14, since they were 230 miles from the scene of operations and were such a small and lightly armed force that they could have no effect on the campaign in Mesopotamia. Of greater interest was the report of the arrival in Baghdad of the veteran Gen. (Field Marshal in the Turkish Army) Baron Kolmar von der Goltz, the best pupil of Field Marshal Count Helmuth von Moltke. His reputation and his knowledge of Turkey were thoroughly established in the military world, and his British admirers took serious note of his advent, which was likely to make the relief of Kut still more difficult than they had expected. Almost simultaneously with Goltz' arrival, a Turkish commander named Halil Pasha also reached the Mesopotamian capital. He was a bold soldier, and the combination of experienced age and enterprising youth was likely to prove formidable.

The British and Indian governments had created their own difficulties. They had embraced them and the risks which they embodied in the hope of providing their own people and those sections of the Muslim world which backed them with a victory to counter the disaster of Gallipoli. In war, however, a clear purpose is an indispensable element of good strategy.

Origins of the Campaign in Gallipoli, January-March 1915.—On Jan. 2, 1915, a message from the Russian commander in chief, Grand Duke Nicholas, was delivered in London. Its contents may seem insignificant when it is considered how immense were the consequences, for it asked no more than that a demonstration be mounted against the Turks in order to induce them to withdraw troops from the Caucasus. Once the victory of Sarikamis had been won, however, the grand duke withdrew his plea, and it is certain that the Russian government would at that time have been sorry to see its allies in the Bosphorus. This does not alter the fact that the conception of the 1st Earl Kitchener, the secretary of state for war, and Winston Churchill, the first lord of the admiralty, to open communications with Russia by forcing a passage through the Dardanelles, was good strategy from the Russian point of view as well as from the British and French.

Before the land forces of the Allies reached the scene, their naval forces tried to do the job by themselves. The first efforts, from mid-February to mid-March, were on the whole successful; after the outer forts had been thoroughly pounded, landing parties were able to blow up the guns. The intermediate forts covering the Narrows were expected to be more difficult to reduce, but the naval commander, Rear Admiral Sir John de Robeck, and his staff officer, Commodore Roger J. B. (later 1st Baron) Keyes, were optimistic.

GALLIPOLI CAMPAIGN, 1915. On March 18, 1915, British and French naval units attempted to force their way through the Dardanelles, but withdrew after several battleships were lost in the minefields. On April 25, a well-planned amphibious Allied attack, accompanied by demonstrations and feints to deceive the Turks, was launched. Landings were made at Cape Helles and Ari Burun, but the advance inland was stopped by the Turks after meager gains. In early August, a second attempt was made. The main landings in Suvla Bay were to be supported with offensives by the forces already ashore at Cape Helles and Ari Burun. The Suvla Bay landing was a success, but the advance ashore was stopped after a gain of only a few miles. The supporting offensives at Cape Helles and Ari Burun accomplished little. During the period Dec. 10, 1915-Jan. 9, 1916, the British and French completely evacuated the Gallipoli Peninsula.

It is still a moot point whether or not their optimism was justified. When the attack was made on March 18, a French battleship, a British battleship, and a British battle cruiser were sunk on a newly laid minefield that was undiscovered

and swept; two other ships had to be beached; and a sixth was put out of action by the defense. On the other hand, it is now fairly well established that the Turks were at the end of their resistance, mainly for want of ammunition. Keyes sensed this and urged de Robeck to renew the attack, but the admiral understandably declined to do so in view of the terrible losses in ships and men already sustained. Gen. Sir Ian Hamilton, who had arrived in the area in advance of his troops, refused to advise a resumption of purely naval efforts for the same reason.

Landings on the Gallipoli Peninsula, April-May 1915.—The force made available to clear the way for the passage of the two navies consisted of four British divisions, including the Anzac (Australian-New Zealand) Corps, and one French division. The French were to make a feint landing on the Asian shore at Kumkale, where some thought the main operation should be conducted.

The Turkish commander, Liman von Sanders, had two more divisions than Hamilton had. He posted one at Cape Helles, the toe of the Gallipoli (Gelibolu) Peninsula; one at Maydos (now Eceabat), just north of the Narrows; two on the Asian side; and two at Bolayir (Bulair), 40 miles north of Helles at the narrowest point of the peninsula, where it was defended by the Bolayir lines. On the map this appeared to be the most favorable place for the main British landing, but Hamilton had ruled it out because of the strength of its fortifications. Hamilton had arranged that one of his assault divisions should demonstrate in front of Bolayir before being transferred to its next duty, and Liman von Sanders intended to send the two divisions there to Cape Helles or to any intermediate point on the peninsula where the need was urgent. It may thus be said that the two generals' conceptions of the right way to attack and hold the peninsula coincided and may be considered sound.

On the British side, the obverse to the potential advantages of the naval attack must be examined. The attack had put Liman von Sanders on the alert, which he cannot be said to have been before it. Much criticism was therefore directed at Churchill, the chief sponsor of the operation, and allegations that he ruined the chances of the expedition were often repeated in later years. In point of fact, Liman von Sanders was deceived by the spectacle of ships and landing craft lying off Bolayir on the morning of April 25. He mounted his horse, galloped up to the town, and spent the night there. The Russian Black Sea Fleet bombarded the Bosphorus forts and thus increased the illusion of an attack on Bolayir, though the bombardment was in fact a second example of the jealous policy of the Russian government where the straits were concerned. Russia was determined that if Constantinople were to be occupied by her allies, her troops should be on the spot. It was a junior Turkish divisional commander, Mustafa Kemal (later celebrated as Kemal Atatürk), who saved the situation by engaging his whole division without authorization against the Anzacs and holding the heights which were their objective.

The Helles landings were a tragedy. Of four landings, one was repulsed altogether after sickening slaughter in the salty ports of the *River Clyde*, a collier grounded to act as a landing ship, and one was abandoned in panic, but a firm foothold was secured eventually. In the Anzac landing an error in navigation put the troops a

mile north of the planned beach in an area backed by steep ridges, but the determined attackers fought their way into a defensible position. At home the reaction was the formation of a coalition government on May 25 and the removal of Churchill from the Admiralty two days later. Then the tide turned in favor of the campaign, which was strongly backed by the new government and was given priority over the western front for ammunition supplies. The Mediterranean Expeditionary Force was raised to a strength of 13 divisions, 2 of them French, against the 16 divisions of the expanded Turkish force.

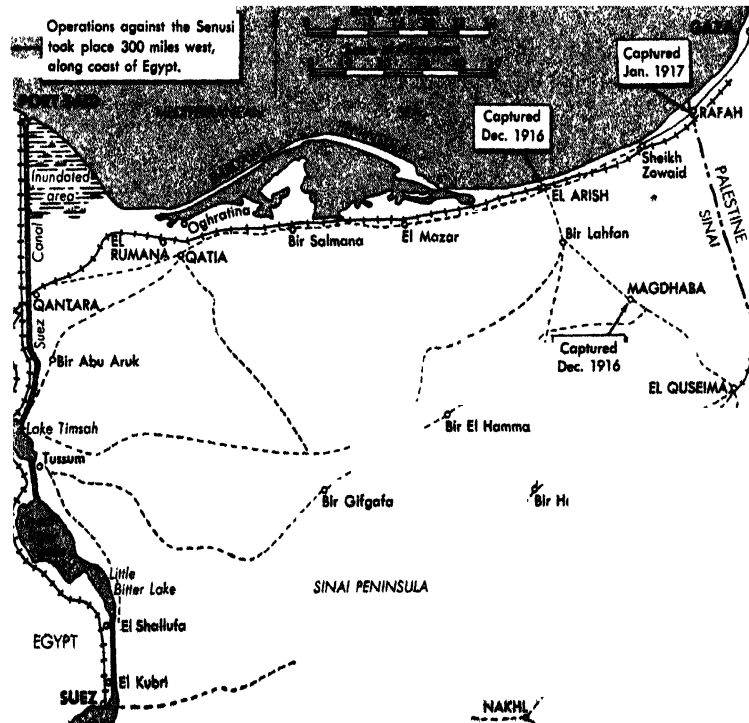

Landings at Suvla Bay and Evacuation of Gallipoli, August 1915-January 1916.—The new plan was to land two divisions at Suvla Bay; these were to surprise the enemy and then march eastward together with the Anzac Corps, thus cutting off the main Turkish force. The landings at Suvla on August 6 were virtually unopposed, but the initial advantages were wasted because of the inexperience of the troops, who indulged in picnics and bathing parties, and the inertia of the senior officers, including Hamilton. Liman von Sanders had ample time to move two divisions from Bolayir and repulse the attack. Despite great efforts made by supporters of the enterprise to keep it going, this was the end of the campaign. Kitchener visited the peninsula and cabled to London on November 22 that the Anzac and Suvla beachheads should be evacuated. Meanwhile, Hamilton had been ordered home. He was succeeded by Gen. Sir Charles Carmichael Monro, who had the over-all command at Gallipoli and Salonika, where a new campaign was beginning; Lt. Gen. (later Field Marshal) Sir William Riddell Birdwood, the Anzac Corps commander, was placed in command on the peninsula itself. The evacuation was completed when the rear guards were taken off early on December

20 without the loss of a man. No such good fortune was expected at Helles, but the same result was achieved early on Jan. 9, 1916. For the entire campaign, the British alone had a casualty list of 214,000, a colossal figure.

It is safe to say that no other campaign was so ill conducted by Britain during the war. Each landing provided an admirable opportunity of securing the passage of the Dardanelles, and each opportunity was wasted. The final decision to withdraw was then inevitable for two reasons. First, the piers were too fragile to withstand winter gales. Secondly, German, Austrian, and Bulgarian forces had routed the Serbs, driving them from the Baghdad Railway, and enabling munitions to be delivered to the Turks in great quantities and at speed over a direct line.

Campaigns Against the Senusi and in Sinai, 1915-1916.—The British had won freedom of political action in Egypt in December 1914 by deposing the khedive, Abbas II Hilmi, an extreme pro-Turk who was living in Constantinople. He was succeeded by his uncle, Hussein Kamil, a moderate and sensible man who ascended the throne with the title of sultan, afterward changed to that of king. On Feb. 2, 1915, a Turkish force of 20,000 men under an able German officer, Col. (later Gen.) Baron Friedrich Kress von Kressenstein, approached the Suez Canal halfway between Lake Timsah and the Great Bitter Lake. Its march across the Sinai Peninsula had been in the best Turkish tradition, for the main body disdained the coast route and followed the almost waterless track through Nakhil, dragging pontoons through the deep sand. Three boatloads of soldiers actually crossed the canal, but the force was mercilessly pounded by British and French warships and had to withdraw by the way it had come. The British had not as yet assembled enough camels for a pursuit.

CAMPAIGNS IN SINAI, 1915-1917. In February 1915, the Turks attacked the Suez Canal in force and actually got some troops across, but they were finally driven back. After subduing an uprising of the Senusi in Egypt, the British began an advance through Sinai to the Palestine frontier. The rate of advance was governed by the progress of construction of a railroad and a water pipeline, needed to support the troops in the desert wastes. The British entered the desert in May 1916, brushed Turkish resistance and attacks aside at several points, and reached Rafah, on the Palestine border, in January 1917. They now prepared for operations against the Turkish stronghold at Gaza.

The evacuation of Gallipoli raised the question of whether it would further Turkish designs against Egypt. Some exaggerated estimates were made of the number of troops that could cross the desert, with the result that a major fortification of the canal was undertaken, and 14 divisions were assembled in an Imperial Strategic Reserve, which included divisions from France and the United Kingdom as well as those from Gallipoli. This force was speedily dispersed, however, 10 of the divisions having left Egypt by the middle of the year.

The chief activity in the Egyptian theater was that directed against the Nile Delta by Ahmad al-Sharif, head of the powerful sect of the Senusi (Sanūsī), with whom Enver Pasha's half brother, Nuri Bey, was residing. Ahmad gave the British of General Maxwell's command much trouble by his elusiveness, time after time escaping in a series of running fights. At the Battle of the Wadi Majid, fought on Christmas Day 1915, the skilled young Turkish commander of his forces, Jafar Pasha, put more than 2,500 men into action. At Halazin on Jan. 23, 1916, Jafar carried out a fine counterattack and inflicted more than 300 casualties on the small British force. At Agagiya on February 26, however, Jafar was wounded and captured, and without him Senusi activities declined almost to nothing. Maxwell, having completed his task of rendering Egypt secure from the west, returned to England. By this time, Lt. Gen. Sir Archibald Murray had taken over the bulk of the troops on the Suez Canal and in the Nile Delta. He now included under his authority all those in the theater of war, and the title of Mediterranean Expeditionary Force was

exchanged for that of Egyptian Expeditionary Force.

Advance into Sinai, 1916.—At the beginning of 1916 the command in Egypt was committed to an advance into Sinai toward the Palestinian frontier. The advance was to be extremely deliberate, being accompanied step by step by a railway and a pipeline to provide water, though General Murray's numerous yeomanry and Australian and New Zealand cavalry were expected to range ahead in order to protect the main body of troops and the Egyptian workmen against a surprise attack. In April, however, this screen was itself subjected to an attack by the enterprising Kress von Kressenstein, who secretly led a Turkish force of 3,500 men to the oases of Oghratina and Qatia and routed their garrisons.

In the latter part of May, Murray moved an infantry division east to El Rumana (al-Rumanah; Romani), which was now established as the railhead, though the pipeline lagged behind. The division had to be supplied with water either by trucks from Qantara (al-Qantarah) on the Suez Canal or from the pipehead by camel convoy. Then the situation changed dramatically, for Kress was active again. On July 19, an aircraft discovered a force of about 2,500 Turks in a depression 20 miles southeast of the railhead; later, it was found that 16,000 men were on the march. These included the German personnel of four batteries and two trench mortar companies.

Murray could bring a considerable numerical superiority to bear—in fact, one measured almost entirely by the water supply, in which British needs were several times as large as those of the Turks. He realized at a glance that Kress would not dare to attack the railroad defenses frontally, and that, since the British left lay on the sea, he must try to envelop the right. This in its turn would afford an opportunity to take the Turks on their flank. To add to Kress' confusion, Murray proposed to establish a false flank. He was an experienced staff officer, and in the prewar period this type of defense had been emphasized in military training. A position four miles long was selected but left unvisited and untouched, except that telephone lines were laid down. Natural gullies in a patch of hard sand provided adequate defense. The false flank was entrusted to two brigades of the Australian Light Horse, with strong reserves behind it, and to this force was given the task of holding the Turks until they could be outflanked by the remainder of the mounted troops.

The Turkish attack was launched early on August 4, and it was soon evident that the Turks were not only fulfilling their destined role but doing it with great ardor and pluck. The situation of the cavalry became precarious, but frontal attacks on the defenses of El Rumana caused the British infantry no concern. Finally, as darkness gathered about 7 P.M., the reserves brought the enemy's advance to a halt. At daybreak on August 5, the British, including an infantry brigade, assaulted with bayonets. The brave Turkish rear guard was forced to surrender: 1,500 prisoners were taken, most of them in an agonizing condition for want of water. The mounted advance captured many more Turks, but its efforts soon slackened as the shortage of water affected it also and prostrated the majority of the troops. The morale of the main body of Turks never broke, but Turkish losses totaled 6,000 of whom 4,000 were prisoners, as against

a British casualty list of 1,130.

Siege of Kut, 1916.—There was small likelihood that the Turks would take Kut by assault so long as the British garrison could stand on its feet. The sack of the Tigris bend in which the town lies is less than two miles long and not much over a mile wide. After Townshend had fortified the open northwestern end of the sack with three lines of trenches, there was nothing left for him to do but send out his cavalry brigade before he was completely invested and await relief. The first attempt at relieving him, made by Lt. Gen. Sir Fenton John Aylmer in January 1916, was abortive, the Battle of Shaikh Sa'ad (Shaykh Sa'd) costing 6,000 casualties. Aylmer tried again in March, by which time the Turks were well dug in, and failed to take the Dujaila redoubt despite the gallantry with which his assaults were pressed, losing nearly 3,500 men, including 500 killed and 500 missing. By this time, Townshend had resolved to kill 1,100 horses and mules to keep the garrison alive.

SIEGE OF KUT, 1916. Three attempts were made to rescue Townshend and his British troops besieged in Kut. The first was turned back in an abortive battle at Shaikh Sa'ad. The second, in March, also failed. In April, a third attempt was made with some initial success, but it bogged down in front of the strong Turkish trenches at Sannaiyat. The British garrison of Kut surrendered on April 29, after having suffered great privations and many deaths.

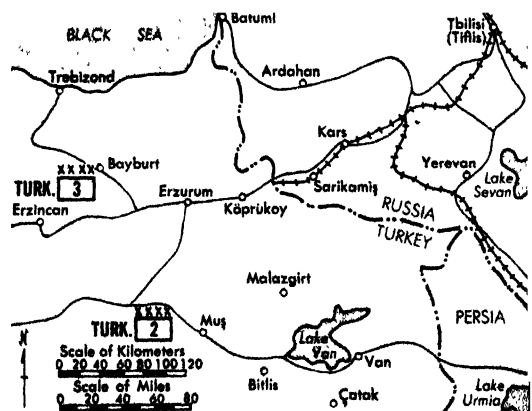

Aylmer was now succeeded by Gorringe, who in April was to make what was generally recognized as the final and decisive attempt at the relief of Kut. Acting with skill and vigor, Gorringe succeeded in breaking the Turkish front at Bait Aissa on the right bank, and hopes of relief soared. This, however, entailed another assault on the left bank and penetration at Sannaiyat of a heavily fortified gap between the Tigris and a marsh. On April 22, Gorringe made the attempt, was repulsed, and reported that his troops had for the time being reached the end of their offensive powers. Lord Kitchener then authorized the command to open negotiations for surrender. These were carried out by Townshend and Halil in a Turkish launch, and the surrender took place on April 29. Goltz had died of cholera on April 19, but not before he knew that Kut was doomed to fall. The prisoners were barbarously treated, being flogged across the desert by their mounted escort. The people of England took the catastrophe hardly, but it had curiously little effect in the Arab lands.

In August, Gen. Sir Frederick Stanley Maude succeeded Lt. Gen. Sir Percy H. N. Lake, who

had only six months earlier succeeded Nixon. Maude was a strong advocate of a forward policy and won the support of General Monro, who visited him en route to take up his new appointment as commander in chief in India. The war cabinet took the two generals' side against that of the War Office, but the latter then withdrew control of the Mesopotamian campaign from India and assumed it itself. Maude now had five divisions at his disposal, four of them in two corps on the Tigris and the fifth on the Euphrates. He was by far the best soldier engaged in this hitherto luckless theater, but his resources were also much superior to those of his predecessors. Including cavalry and troops on the lines of communication, his forces totaled 340,000 men, although only 166,000 of them were fighting troops (107,000 Indian and the remainder British). Turkish fighting strength was estimated at 42,000, half that number being stationed on the Tigris and the remainder on the Euphrates and at Baghdad. The Turkish Sixth Army was riddled with disease, and reinforcements never equaled the wastage from this source plus the battle casualties. Nevertheless, the Turkish soldier was nearly as formidable as ever in a prepared position, and unless he could be maneuvered from it, gains could be secured only at great cost. Maude began his advance northward on December 13.

Operations in the Caucasus, 1916.—The destination of the Turkish divisions which had fought on the Gallipoli Peninsula was a source of anxiety to the Russian General Staff early in 1916. It was to be expected that a fair number would be dispatched to Syria and Mesopotamia and a few to Europe, but a majority would certainly be moved eastward in Asia Minor against the forces under the command of Grand Duke Nicholas. A Russian defeat there might be deadly, though it did not count as a main theater of war.

The grand duke, formerly the Russian commander in chief, was playing a minor part now as viceroy of Transcaucasia. His subordinate, General Yudenich, studied the problem of the Gallipoli divisions in detail and concluded that

OPERATIONS IN THE CAUCASUS, 1916. Anticipating that the Turks would take the offensive in the Caucasus with the troops released by the British evacuation of Gallipoli, the Russians struck first. In January, they took Koprükoy; in February, Erzurum; and in April, Trabzon. The Turkish Gallipoli divisions tried to recapture Erzurum in May and Trabzon in June, but without success. The Russians continued their advance, capturing both Bayburt and Erzincan in July, practically destroying the Turkish Third Army in the process. To the south, the Turkish Second Army took Muş and Bitlis in mid-August, but the Russians turned the two towns a week later.

none of these forces was likely to appear before late March. The Russians should therefore anticipate the Turkish offensive, which would inevitably be launched as soon as possible after that. Yudenich prepared his plan and its material components, and only after that had been accomplished went to Tbilisi to lay them before his chief. Yet the grand duke could never be a cipher, and with any lieutenant but Yudenich he would have intervened far more comprehensively.

The latter must have recalled the Battle of Sarikamis, fought at the same time of year as that in which he now proposed to attack. He provided his troops with fur caps, thick shirts, and felt boots for marching in the snow. His offensive at Köprükoy on January 17 took the Turks by surprise and, though complete envelopment failed, forced Abdul Kerim into retreat at the best pace he could muster with a loss of about 25,000 men, largely from frostbite.

On February 12-16, Yudenich exhibited great skill and daring in storming Erzurum, a notable feat for an army without siege artillery, by his swift infiltration between the forts. Simultaneously, he sent General Lyakhov westward along the coast in a combined operation with the Black Sea Fleet against Trebizond (Trabzon). By systematically bombarding the steep valleys running down to the shore and conveying two brigades from Novorossisk, the fleet put Lyakhov into the best roadstead on the north Anatolian coast on April 17.

Meanwhile, Enver made ambitious plans for the Gallipoli divisions, which were to engage the Russians on a wide front south of the Black Sea and simultaneously to turn their flank at Bitlis, near Lake Van. Yudenich did not want to await the attack passively, but in view of the enemy's superior strength he had to choose his opportunities carefully. At the end of May, without awaiting the arrival of the bulk of the reinforcements on their way, the Turkish Third Army attacked west of Erzurum, but its offensive soon collapsed. In June, Enver, angry that the Russians should retain Trebizond, to which they were steadily sending troops, ordered its recapture, but once more his lieutenant failed him.

Meanwhile, Yudenich had completed his deliberate preparations. His main blow, on July 2, was struck through Bayburt, located south-southeast of Trebizond at the apex of a triangle of which the base ran from Erzurum to Erzincan. As was his general practice in this country of few roads, he planned to split the enemy's front and not to turn his flank. The shock was tremendous and led to a crushing Russian victory and the capture of the road center of Erzincan on July 25. Harried by the Cossacks, the Third Army was removed from the war. It had lost 17,000 men in killed and a like number in prisoners taken by the Russians. To these figures must be added an unknown number of deserters who had settled in the villages. On the Turkish right wing, the Second Army did not launch its attack until it had received all the reinforcements allotted to it, but also not until Yudenich had been able to send southward troops that had fulfilled their mission at Erzurum. While this attack achieved some success, the only sector where it could be said to have been substantial was on the right flank, where Mustafa Kemal, now a corps commander, captured Muş and Bitlis on August 15. Kemal's achievement showed what a fine commander could do at the head of a sea-

soned, well-trained army, proud of its victory at Gallipoli, but even the very moderate army commanders employed in Asia Minor might have accomplished much more if they had been placed under any commander but Enver. In any case, Yudenich was able to recapture Muş and Bitlis on August 24.

Arab Revolt and Campaign on the Palestinian Frontier, 1916-1917.—On June 5, 1916, Sherif Husayn (Hussein), ruler of the Hejaz under Turkish control, began a successful revolt against his overlords, and on June 10, after three days' street fighting, captured the summer garrison at Mecca (Makkah). He next turned his attention to Taif (al-Ta'if), where the main body of the Hejaz garrison was installed according to custom and, with the aid of two Egyptian mountain batteries under their own Muslim officers, forced it to surrender. This time the Arab commander was Husayn's second son, 'Abdullah, later emir of Transjordan and king of Jordan. By then the Arabs had captured more than 5,000 prisoners, but this was the last of their good fortune for a long time. Faysal, Husayn's third son, failed completely in an attempt to capture Medina (al-Madinah), which was held by the Turks until the end of the war. The British had prepared trouble for themselves by the secret Sykes-Picot agreement of May 16, which allotted Syrian territory to France without regard to British pledges to Husayn. It was a case of the left hand, Sir Mark Sykes, not knowing what the right hand, Lord Kitchener, had promised the Arabs.

By December 1916, the British forces in Sinai had reached the neighborhood of El Arish (al-'Arish), 27 miles from the frontier of Palestine. Murray was being urged by Prime Minister David Lloyd George, through the medium of the doubting chief of the Imperial General Staff, Gen. (later Field Marshal) Sir William Robertson, to invade Palestine as soon as possible, a task for which he did not believe he had the necessary strength. Nevertheless, after occupying El Arish on December 21, he cleared out the two Turkish outposts south of the frontier. The first was Magdhaba, where, on December 23, 1,300 prisoners were taken for a British loss of 146, and only a handful of the garrison escaped. The second was Rafah, which was captured on Jan. 9, 1917, by five brigades of light horse, yeomanry, and camelry, after a much more fiercely contested struggle. This time the number of prisoners was a little larger, 1,600, but the British losses were not far short of 500.

Capture of Baghdad, 1917.—General Maude's orders to capture Baghdad depended for their fulfillment on supply. In this he was fortunate because he had been provided with 45 (later 64) river craft, but it was not until March 1917 that he considered himself able to furnish support for four infantry divisions and a cavalry division of two brigades as far north as Baghdad. Meanwhile, beginning on January 9, he was engaged in hard-fought actions as a result of which Kut changed hands for the third time. As in 1916, Sannaiyat proved difficult to take, and Maude's assault on February 17 was thrown back in disorder, but this mishap was repaired five days later. On February 25, Kut was found deserted and in ruins.

Maude pressed on at high speed, but had to make a brief halt at Al 'Aziziya. He estimated the Turkish force in the whole theater at about 35,000, as against his own fighting strength of

120,000. The next Turkish stand was made on the Diyala River, which enters the Tigris 10 miles below Baghdad. Maude, whose land artillery was admirably seconded by the Royal Flying Corps and a flotilla of gunboats, laid down a crushing bombardment on the enemy's position. Under its cover he established a pontoon bridge and passed his two brigades of cavalry and a strong force of infantry over to the left bank. Thus outflanked, the enemy was unable to withstand the shock of his attack on the Diyala and abandoned Baghdad. Maude entered the city on March 11. This time he took 9,000 prisoners.

Halil Pasha, who had creditably held together his weary, sick, and underfed army, led it to a strong position 50 miles above Baghdad, with its right flank bent forward to Ramadi (Rumadiyah). He had received two more divisions of 7,000 men each, but his forces were perilously strung out, his left facing on the Persian frontier a Russian force inclined to break up as a result of the revolution. Maude had still to consider whether any substantial additional forces of Yilderim (Lightning) troops would reach the scene, but that danger passed, and he had been promised two more divisions from India. In any case, he did not intend to move while the baking summer heat lasted.

On November 18, less than two months after an impressive victory at Ramadi (September 29), in which the majority of the garrison was captured, the commander in chief died in the house in Baghdad which had seen the end of Goltz, and like him of cholera. Maude's death came as a shock to the people of Britain, for whom he had become by far the most popular soldier of the war. In the first place, he had transformed the life of the troops with the aid of supplies from home and of the work of a remarkable administrative officer, Maj. Gen. Sir George Fletcher MacMunn. Chicken farms and kitchen gardens provided fresh eggs and fresh vegetables to supplement the abundant local fruit, and chilled meat became plentiful even for troops in the front line. Electric fans were installed in the hospitals. Secondly, Maude had wiped out the shame of the 1916 surrender at Kut. He was succeeded by his senior corps commander, Lt. Gen. Sir William Raine Marshall, who made a good start by driving the Turks out of Khanaqin on December 9.

General Robertson was, however, no better pleased with the prospects than before. He had divined that Mesopotamia was becoming more and more of a political theater. The oil wells to the north attracted the British government, somewhat to the chagrin of the French, who saw no such interesting prospects for themselves and considered that Britain was failing to do her share. Late in 1917, Robertson had Marshall's best Indian division transferred to Allenby's command in Palestine, where he felt it would find more useful occupation.

First Battle of Gaza, March 1917.—In the spring of 1917, General Murray, though deprived of one of his four divisions, was directed to invade Palestine, starting with the capture of Gaza. His chief subordinate was now Maj. Gen. Sir Charles Macpherson Dobell, to whom he delegated the operation in its entirety. Dobell decided to form a wide screen of mounted troops, in which he was exceptionally strong, to hold off outside Turkish intervention, and within it to storm the town from the south. As in previous

Imperial War Museum, London
A detachment of Indian troops under the command of Gen. Sir Frederick Stanley Maude halts in New Street, Baghdad. The city was taken on March 11, 1917, after it had been abandoned by the retreating Turks.

campaigns, the key to the situation was the water supply, for it was doubtful whether Maj. Gen. Sir Philip Walhouse Chetwode's cavalry force of two divisions, known as the Desert Column, could water horses numbering more than 10,000 anywhere except at the wells of Gaza.

The starting line was the bed of the Wadi al-Ghazze, now nearly dry, from a point six miles south of the town. Gaza was a very formidable objective. Although the garrison totaled only about 4,000 men, and few trenches had been dug, dense and virtually indestructible cactus hedges thick with thorns made the town a natural fortress.

On the morning of the attack, March 26, there was a very heavy fog, but it did not seriously interrupt the envelopment of Gaza by the mounted troops, who used compass bearings. In general, the infantry also defied the fog and made

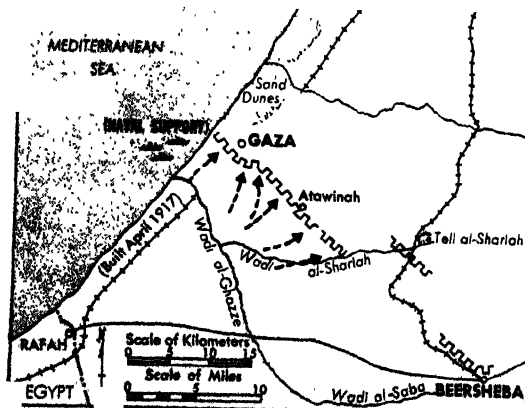

FIRST BATTLE OF GAZA (March 1917). As an initial step in the invasion of Palestine, the British attempted to drive the Turks from their positions at Gaza. The town itself was a veritable fortress. Reliance was placed on the cavalry to isolate the town while the infantry assaulted and carried its defenses. Just as success was within reach, the cavalry was recalled through poor staff work, and the battle was called off.

satisfactory progress, gallantly capturing strong positions on the ridges three miles south of the town.

The rest of the battle was badly managed. The cavalry was ordered to withdraw for lack of water at a time when it had actually found some fair-sized pools and had watered a number of its horses. The crowning positions just captured were abandoned because of an error by Chetwode's staff, and though they were retaken the next day by a fine attack carried out by tired troops, the success came too late. The mounted troops and the right flank of the infantry were pressed sharply by the force driven westward by Kress von Kressenstein. To cap the confusion, Murray sent a misleading telegram to the chief of the Imperial General Staff, hoping to be able to repair the situation before his superiors learned of the reverse. Robertson naturally urged him to make a fresh effort. The British losses were 4,000, and the Turkish 2,400.

Second Battle of Gaza, April 1917.—The situation was now entirely different because the Turks had deployed and dug themselves in along the Gaza-Beersheba road. General Dobell, again left largely uncontrolled by Murray, decided to attack this new position mainly with a single division on a two-mile front beginning two miles southwest of Gaza. He was asking a great deal of his troops, for the gentle ascent there was a veritable glacis. Despite the dauntless courage with which the attack was conducted on April 17–19, it was a complete failure, costing 6,500 British casualties as against 2,000 Turkish. This disparity was too great for Lloyd George and Robertson, though they may not have realized the fact that Murray had remained aloof from responsibility to the extent that his headquarters had become merely a military secretariat. They recalled Murray in June and sent in his place Gen. Sir Edmund Allenby (later 1st Viscount Allenby), hitherto commanding the Third Army in France.

Allenby, known as "the Bull" because of his height, bulk, and explosive temper, was welcomed even by the very democratic Australians and quickly restored the morale of a depressed army. In such circumstances, a new commander immediately demands reinforcements and gets them. Two divisions were forming in the coun-

SECOND BATTLE OF GAZA (April 1917). In April, the British launched another attack against the Turks at Gaza. By now the Turks had strongly entrenched their position from Gaza to Beersheba. The British attack, delivered directly against the trenches, was driven back.

try from dismounted yeomanry units which had served in the Gallipoli campaign and from other troops available. Two more divisions from Macedonia and Mesopotamia raised Allenby's total strength from three to seven divisions, and he formed two corps, commanded respectively by Chetwode and Lt. Gen. (later Sir) Edward Bulfin.

Third Battle of Gaza and Advance into Palestine, October–December 1917.—Allenby's plan was to attack both at Gaza and at Beersheba. The attack at Gaza was to be a holding operation, while Beersheba and its vital wells were to be captured from the east by Australians and New Zealanders with the aid of two infantry divisions attacking from the west. The whole Turkish front along the road to Gaza was then to be rolled up. For the Gaza attack, Allenby was sent eight tanks, the only ones used outside France in the war.

THIRD BATTLE OF GAZA (Oct.–Nov. 1917). Heavily reinforced, the British, under Gen. Sir Edmund Allenby, again attacked the Turkish Gaza position. The initial attack was made against Beersheba, to capture the water wells and, from there, to roll up the Turkish line. The Beersheba attack was successful, and Allenby now struck directly at Gaza, supported by naval gunfire. The Turkish defenses were overpowered, and Gaza captured on November 7.

In the attack on Beersheba on October 31, Allenby had unmerited good fortune. Everything hinged on capturing the wells intact, for without them the cavalry would have to withdraw. In a prolonged fight the local Turkish command had ample time to destroy the wells but failed to do so. Thus the rolling-up process could begin in good time, and it proved most successful. The same could not be said of the exploitation of the cavalry, which was not concentrated quickly enough, although it did inflict heavy losses on the enemy. Allenby now turned his efforts to the coast, made the Gaza feint the real attack, broke through the Turkish defenses with the powerful aid of British and French naval guns, and thrust northward up the coastal plain. Gaza was occupied on November 7, and Jaffa on November 16.

Meanwhile, a grandiose project fathered by Enver, to send a Turkish army of 14 divisions and 6,000 German troops under Gen. Erich von Falkenhayn to retake Baghdad, had proved impracticable because of the impossibility of transporting such a force to Mesopotamia or of feeding it if got there. Falkenhayn himself hurried to Palestine, and the first of the Yildirim divisions arrived in time to take part in the Battle of Gaza.

Falkenhayn missed no opportunity of harassing Allenby's open flank, but he lacked the strength to do more.

The German general gave more trouble when Allenby wheeled into the Judean Hills, launching a number of successful counterattacks and blocking the British project. By Allenby's direction, Bulfin had made his thrust seven miles north of Jerusalem in order to avoid the risk of damage to the Holy City, but the commander in chief could no longer maintain this policy. He brought up Chetwode's corps for a direct drive across the Jaffa road, and after very hard fighting received on December 9 the surrender of Jerusalem, which had been handed over to the municipal authorities by the Turks. Allenby made his entry on December 11, on foot and with the greatest modesty, in accordance with instructions from Lloyd George.

Falkenhayn made an attempt to recover Jerusalem on December 26-30. The Turks once more gave of their best, but the venture was hopeless in the face of Chetwode's strength and preparedness; in fact, Chetwode counterattacked and drove the enemy back to the safe distance of eight miles from Jerusalem. The victory was complete but costly. Turkish losses in the campaign to date were approximately 25,000, of whom 12,000 were prisoners of war. The losses of the Egyptian Expeditionary Force totaled 18,000.

The activities of the Arabs were not of major importance during 1917, but they strained Turkish resources by means of raids on the Hejaz Railway and held out great promise for the future. They had been enlivened by the influence and exploits of an extraordinary young genius, T. E. Lawrence, who was consistently supported by both Murray and Allenby. Lawrence allied himself in particular with Husayn's son Faysal.

End of the War in the Caucasus, 1917-1918.—The campaigns of Yudenich and his hard-fighting troops in the Caucasus ended tragically. On the whole, these forces, especially the Armenians, resisted the summons of Vladimir Lenin and Leon Trotsky to return to their homes rather more strongly than did the troops on the eastern front. Nevertheless, the command was quickly paralyzed by insubordination, and soon it and the hierarchy of officers lost all authority. The Cossacks led the rush back to the farms, which were, as they believed erroneously, to become their personal property as free peasants. Yudenich also went home and later distinguished himself in the civil war.

The Turks now enjoyed a favorable situation, which was to continue until the autumn of 1918, when their collapse in Syria and that of the Germans on the western front reversed it. They had already perpetrated abominable massacres of the Armenians while engaged in fighting the Russians in 1915, and now the massacres were resumed. Estimates of the number of Armenians who were killed or died of starvation during the war vary, but the deaths amounted to at least half a million. In addition, the lives of such communities as the Georgians were gravely disrupted.

Palestine, Transjordan, and Syria, 1918.—Immediately after the operations for the capture and consolidation of the Jerusalem-Jaffa line, Palestine suffered unusually heavy rains and floods, which delayed Allenby's contemplated advance. In March 1918, he did carry out a large-scale operation, which he considered promising, for the destruction of the Hejaz Railway at Am-

man ('Amman). The operation was in many respects well conducted, and on March 30 the town was ringed on all sides but the east. The attacking force was not strong enough to tip the balance, however, and in the afternoon orders were issued for a general withdrawal after trifling damage had been done to the railway. The great viaduct, which had been the principal objective, had not been reached. A second raid into Transjordan was nullified on April 11 by a brilliant counterattack across the British communications in the Jordan Valley in which the Australians lost nine guns. The perilous retreat to Palestine was safely accomplished.

By this time the great German offensive of March 21 had been launched on the western front. The War Office, spurred by a sense of guilt at having left too many first-class troops in Palestine, recalled all that it safely could. In April, the Lys offensive led to further demands. Allenby's Yeomanry Mounted Division was reconstituted with Indian regiments from the Indian cavalry divisions in France, and they sufficed with the yeomanry to form an entirely new cavalry division, of which he now had four. In all, Allenby sent to France two infantry divisions, nine yeomanry regiments, 23 infantry battalions, and some heavy artillery, aggregating almost 60,000 men. He retained four cavalry and seven infantry divisions, including a second division from Mesopotamia, but most of the Indian troops were raw.

The Turks, in addition to a German contingent represented by a small but heavily armed division, had received some reinforcements, but they never attained a strength of 30,000 even if the troops on the Hejaz Railway north of Ma'an were included, whereas the British forces were well over twice as large. They had a new commander in chief in Liman von Sanders, who had replaced Falkenhayn in March. The change in

THE TURKISH COLLAPSE, 1918. Palestine.—After the capture of Jerusalem in December 1917, the British conducted unsuccessful operations against the Hejaz Railway until March 1918. Then many of the troops were transferred to the western front to help stem the German offensives. Operations in Palestine were resumed in September 1918, when the British routed the Turks in the Battle of Megiddo, bringing their forces to the point of disintegration. The British pressed the pursuit, captured Damascus on October 1, Homs on October 16, and continued northward until the armistice on October 31. **Mesopotamia.**—Concurrently with the drive in Palestine, the British advanced from their base at Baghdad, forced the surrender of the Turks on their front in the Battle of Sharqat, and entered Mosul on November 3 (the last Turks left the city on November 10).

leaders brought about a change in strategy and major tactics, from defense by maneuver to defense by resistance in trenches.

Meanwhile, the exploits of Lawrence, now a major, had been outstanding. Perhaps the high point was reached at Tafilah (al-Tafilah) in southern Transjordan, which may be described as a classic operation. Falkenhayn had sent two strong columns which compelled the Arabs to evacuate the village, but in the end it remained in their possession after changing hands five times. Allenby's aid was generous. The Arab Northern Army, which now included small regular sections, was the nucleus of a far larger force of Bedouins and villagers who could be called out as needed. The attacks on the Hejaz Railway were increased until Medina was cut off because the supply of spare rails had been exhausted.

Allenby's plan was to mass his infantry in the coastal plain, wheel to the right, and open a gate for his Desert Mounted Corps of three cavalry divisions. The assault in what became known as the Battle of Megiddo began on September 19. Here and there Turkish resistance was determined, but demoralization soon appeared, and the gate was open. Bombing by aircraft was highly effective, blocking traffic for long periods. The two leading cavalry divisions went forward at 7 A.M. One, emerging the next morning into the plain of Esdraelon (Jezreel), reached the Jordan at Beisan (now Beit-Sh'an), having covered 70 miles in 34 hours. The other entered Nazareth and just missed capturing Liman von Sanders. Lawrence and his Arabs took Der'a at the junction of the Palestinian railways and the Hejaz line, and the Australians and New Zealanders captured Amman and blocked the Turkish Fourth Army, taking 10,000 prisoners.

Damascus was reached by the Desert Mounted Corps on October 1, and Homs (Hims) by the 5th Cavalry Division on October 16. The latter then went on alone because the 4th Cavalry Division was prostrated by malaria and influenza, and a last action was fought at Haritan on Oc-

tober 26 before news arrived that an armistice had been concluded with Turkey. The 5th Cavalry Division had marched 550 miles in 38 days. Allenby took 75,000 prisoners, while British losses amounted to a little more than 5,600. A plan of genius involving great risks for the cavalry, which had to live on a denuded countryside, had ended with one of the most crushing victories of modern times.

Advance to Mosul, 1918.—Gen. (later Field Marshal) Sir Henry Wilson, who had succeeded Robertson as chief of staff in February 1918, was inclined to subordinate military considerations to political ends. These included saving Georgia, Russian Armenia, and Russian Azerbaïdzhan from the Turks and Germans, and securing the oilfields of Mosul. General Marshall, having lost two divisions to Allenby, had a difficult problem to face when he was ordered by Wilson to begin his advance up the Tigris. He allotted to the operation a corps under the command of Lt. Gen. Sir Alexander Stanhope Cobbe. At first there seemed to be no great necessity for haste, but in mid-October the Turks secured the good offices of Spain in approaching President Woodrow Wilson in their quest for peace. The fact that they were seeking an armistice made Mosul more attractive than ever and spurred Henry Wilson and his political masters to establish a *fait accompli* in the eyes of the world. In the Balkans, after Gen. Louis Franchet d'Espèrey's crushing victory in Macedonia in September and his advance to the Danube, the British commander, Gen. Sir George Francis Milne (later 1st Baron Milne), had wheeled right to the Turkish frontier on the Maritsa River, but there had been no further fighting. Turkish plenipotentiaries reached Mytilene, Lesbos, on October 20, and from then on Marshall advanced as fast as he could, starting on October 23. Ismail Hakki, commanding the Turkish Tigris Group, withdrew to the Little Zab River, a tributary of the Tigris 50 miles to the north.

Marshall pursued the Turks at great speed, and his leading cavalry brigade, covering 77

miles in 39 hours, forded the Little Zab. Ismail Hakkı maneuvered neatly to face the threat to his flank, withdrawing all troops on the left bank to the right and dismantling his pontoon bridge, but he was given no respite. On October 26, the British brigade discovered another ford over the Tigris 30 miles farther north and came down in the enemy's rear; the next day, Hakkı retired to a position 5 miles north of Sharqat (Qal'a Sharqat). While the British main body was closing on him, the cavalry brigade found itself in a perilous situation, but, having been reinforced by the remainder of its division and some infantry, held its own in heavy fighting.

The Battle of Sharqat was fought on October 29, and though the infantry failed to break through, the Turkish commander realized that he was in a hopeless situation and surrendered early the next morning, having lost 11,300 prisoners and 51 guns, whereas the British loss was only 1,886. The armistice signed in the *Agamemnon* in the harbor of Mudros (now Moudros), Lemnos, on October 30, came into operation the following day.

The Indian cavalry division was ordered to take Mosul as soon as possible, relying on local resources for food and fodder, and it reached a position 12 miles south of the city on the evening of November 1. After much haggling, the Turkish government was told that if it would withdraw without making further difficulties, the British government would refrain from demanding its surrender under a clause in the armistice which stipulated that all garrisons in Mesopotamia must lay down their arms. Halil Pasha, commanding the Sixth Army, protested that the remnant of the army was not a garrison but a field force, but he gave way in the end. The British entered Mosul and installed themselves firmly on the Caspian Sea, reoccupying Baku, which they had formerly held with a token force in aid of the Russian garrison, but from which they had been compelled to withdraw because their allies fled whenever the Turks attacked.

The campaigns in Mesopotamia cost Britain and India 92,500 men, of whom 18,620 were killed or died of disease. It would seem that the oil wells and pipelines might have been more economically safeguarded. From another aspect, Mesopotamia does credit to the United Kingdom and India. Except for the Russian operations in the Caucasus, they bore the weight of the war with Turkey, a stupendous burden in view of the British effort on the western front, at sea, and in the air.

12. Balkan Campaigns

Major European powers had direct interests in the Balkan states in the period before World War I. Austria-Hungary, having absorbed the former Turkish provinces of Bosnia and Herzegovina in 1908, had visions of further expansion to the south. Russia, self-appointed guardian of "her

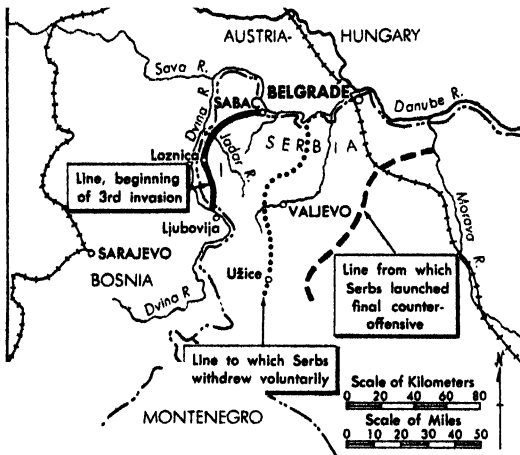

little Slavic sisters," feared an Austrian advance to the Dardanelles. Germany needed access to the sections of the Baghdad Railway (q.v.) running through Serbia and Bulgaria to join forces with her Turkish ally. In the Balkan states themselves feelings of nationalism were strong, and the desire to merge similar ethnic groups and the claims to adjacent provinces bred bitter hatreds. It was inevitable that, when Austria-Hungary set out to punish her troublesome little neighbor Serbia, all of the Balkan states would become embroiled.

In summary, three Austrian offensives against Serbia in 1914 were thrown back by the brave Serbs, but no further action of importance took place there until October 1915. Then, as the German need for the Baghdad Railway became acute and Serbia stubbornly denied passage through her territory, German, Austrian, and Bulgarian troops in superior numbers overran Serbia and her staunch ally Montenegro. (Bulgaria, finding the offers of the Central Powers more attractive than those of the Allies, had joined the former on October 14.) In an attempt to help Serbia, the Allies established a front in Greece based on Salonika, but it had not grown sufficiently in time to render material aid. The Greek government wavered between a pro-Ally and a pro-German attitude according to whether Premier Eleutherios Venizelos or King Constantine I wielded power. Finally, in June 1917, the pro-German king was forced to abdicate, and Greece joined the Allies. Rumania weighed the offers of both sides and waited for a propitious time to join the winning side. Although she chose the eventual winner, she timed her entrance poorly. Entering the war in August 1916, she was promptly crushed by an avalanche of German, Austrian, Bulgarian, and Turkish troops before the Allies could help her. Finally, in September 1918, when the Germans' efforts were concentrated on their collapsing western front and Austria was fully occupied in Italy, the greatly enlarged Allied Salonika armies came to life and moved against isolated Bulgaria, forcing her to seek an armistice.

Austrian Invasions of Serbia, 1914.—With a neutral Bulgaria on Serbia's eastern border, the Austrians could attack Serbia only from the north and west in 1914. There they were confronted by the Danube, Sava, and Drina rivers, which were wide and unfordable. Behind the rivers mountain ranges presented formidable obstacles to offensive military operations. Austria-Hungary possessed an overwhelming superiority in manpower, and the Serbs realized that they would have to fight a defensive war until the Allies could come to their aid. Gen. Radomir Putnik, the Serbian military commander, therefore planned to hold the river lines at the border with outposts while he concentrated his main forces in a central position just east of Valjevo. When the direction of the main Austrian attacks became known, he could meet them with most of his strength. Although his troops were woefully weak in automatic weapons, artillery, and transport, most of them were veterans of the Balkan Wars of 1912–1913 and were hardy and determined individuals.

On August 12, three Austrian armies, totaling 19 divisions, began their invasion—the Second Army from the north, and the Fifth and Sixth armies from the west. To meet them, Putnik had 12.5 divisions organized into three small armies

and totaling about 200,000 men. One corps of the Austrian Second Army quickly captured Sabac (Shabats), and by August 15 the Fifth Army had pushed its way against stubborn resistance to the Jadar River. The next day, Putnik launched a strong counterattack that drove the Austrians back across the border. The Austrians contributed substantially to their own defeat: Gen. Oskar von Potiorek failed to coordinate and direct the operations properly, and the brunt of the invasion was borne by only 8 of the available 19 divisions. Moreover, the Austrians underestimated the speed of the Russian advance in Galicia and were forced to draw first half and then all of the Second Army from the Serbian front to counter the Russians.

AUSTRIAN INVASIONS OF SERBIA, 1914. At the outbreak of war, Austria proceeded immediately to punish Serbia. Three invasions were launched in rapid succession. In the first, the Jadar River was reached, but the offensive was mismanaged and the Austrians were driven back across the border. The second invasion was promptly halted by a strong Serbian counterattack; the Austrians, however, retained a foothold in Serbia. The Serbs then withdrew to better terrain and braced themselves for the third offensive. They were forced to give ground, but eventually counterattacked with determination and again expelled the Austrians from Serbia. Threatened by the Russians in Galicia, the Austrians suspended operations against the Serbs.

On September 8, Potiorek launched a second invasion across the Drina and Sava. Initial gains were made, but on September 16 a strong Serbian counterattack brought the invasion to a halt. The Austrians were not completely expelled from Serbia, however, and retained bridgeheads on both rivers. With his forces extended and short of artillery and munitions, Putnik withdrew to higher ground on a line running north and south through Valjevo.

On November 5, Potiorek began his third invasion. By November 15, Valjevo had been captured; by November 29, Belgrade had been evacuated, and the Serbian armies pushed 20 miles east of Valjevo. Inspired by an appeal from old King Peter I, who appeared at the front with his rifle and bandolier of ammunition, the three Serbian armies counterattacked fiercely on December 3. By December 9, the Austrians were so hard pressed that Potiorek ordered a retreat. The last of the invaders withdrew across the border on December 15. Nurtured by hatred, the fighting on both sides had been barbaric.

General Putnik, 67 years old and confined to his room by infirmity, had conducted from maps a brilliant series of operations through his remarkable comprehension of the influence of topography on military campaigns.

Because of their preoccupation with the Russians in Galicia, the Austrians suspended operations against Serbia, but they left a terrible legacy. An epidemic of typhus that had struck their army was inherited by the Serbs in its full virulence. By April 1915, when the scourge was overcome, more than 70,000 Serbian troops and many civilians had died.

Bulgaria's Entrance into the War.—The Serbs had not been misled by Bulgarian neutrality during the Austrian invasions. They knew that the Second Balkan War of 1913 had made the Bulgarians their mortal enemies, and that the latter were merely biding their time. In the spring of 1915 the Germans forced the issue. The Allies were at the Dardanelles, and it was imperative that the Baghdad Railway be opened through Serbia and Bulgaria to permit the movement of troops and supplies to Turkey. The German plan was to have Bulgaria enter the war and to crush Serbia with a combined German, Austrian, and Bulgarian invasion. Both sides had made attractive offers of territorial gains to Bulgaria. The offers of the Central Powers, combined with pro-German sentiment, caused Bulgaria to favor them, but from a military point of view she could not declare war while the British-Turkish issue on the Gallipoli Peninsula was in doubt. When it became apparent that the British Dardanelles operation was a failure, however, Bulgaria decided to cast her lot with the Central Powers. On September 6, Germany, Austria-Hungary, and Bulgaria signed a convention agreeing to joint action against Serbia in the following month.

Collapse of Serbia.—Alarmed by the Bulgarian mobilization, the Serbs pressed the Allies for permission to attack, but the latter, still hopeful of bringing all the Balkan states into the war on their side, refused. A Serbian attack at that time would have made little difference, however, for the overwhelming forces of the Central Powers arrayed against Serbia presaged her ultimate defeat. Four armies, totaling 300,000 men, were massed on the Serbian border: in the north, the German Eleventh and Austrian Third armies, which were concentrated east and west of Belgrade, respectively; and in the east, the Bulgarian First and Second armies, in position from north to south, respectively. Additional troops were available in the rear areas. German Field Marshal August von Mackensen commanded all except the Bulgarian Second Army; this army, operating under the Bulgarian General Staff, was to isolate the Serbs by cutting—the railroad from Salonika.

To meet this onslaught the Serbs had only 200,000 men divided among five armies: the First and Third armies along the northern frontier; and the Timok, Second, and Macedonian armies facing Bulgaria. Outnumbered and threatened from two directions, Serbia had chosen a vulnerable extended linear type of defense. After a heavy bombardment that began on October 6, the German and Austrian armies commenced their passage of the Sava and Danube the next day. Belgrade fell on October 9. The Serbian First and Third armies counterattacked fiercely but unsuccessfully, and to the east the

Bulgarian First Army crossed the border on October 11. By October 18, Mackensen had all of his troops across the rivers and began a full-scale attack. The Serbs on his front were forced back progressively but withdrew in good order to the south and southeast. As they fell back, they blew up stores and depots, and all able-bodied Serbian men left fields and factories to join the retreating armies. To the south the Bulgarian Second Army overcame the opposition of the weak Macedonian Army and, on October 23, captured Veles (now Titov Veles), thus preventing an Anglo-French force of two divisions that was advancing from Salonika from joining the Serbs. These troops, which were all that the Allies could muster to aid Serbia, had arrived too late and in too few numbers to influence the campaign, and by mid-November the Serbs had only the alternatives of surrender or of retreat over the rough mountains. They chose the latter course, and there followed one of the most dramatic and difficult retreats in history. Hard pressed and plagued by hunger and cold, 150,000 men finally reached the Adriatic Sea, whence Allied ships transferred them to Corfu; later they were to join the Allied forces on the Salonikan front. More than 100,000 Serbs had been killed or wounded in the campaign, and 160,000 had been taken prisoner.

The pursuit by the armies of the Central Powers was halted at the Albanian and Greek borders from political rather than from military considerations. Bulgaria wanted to follow the

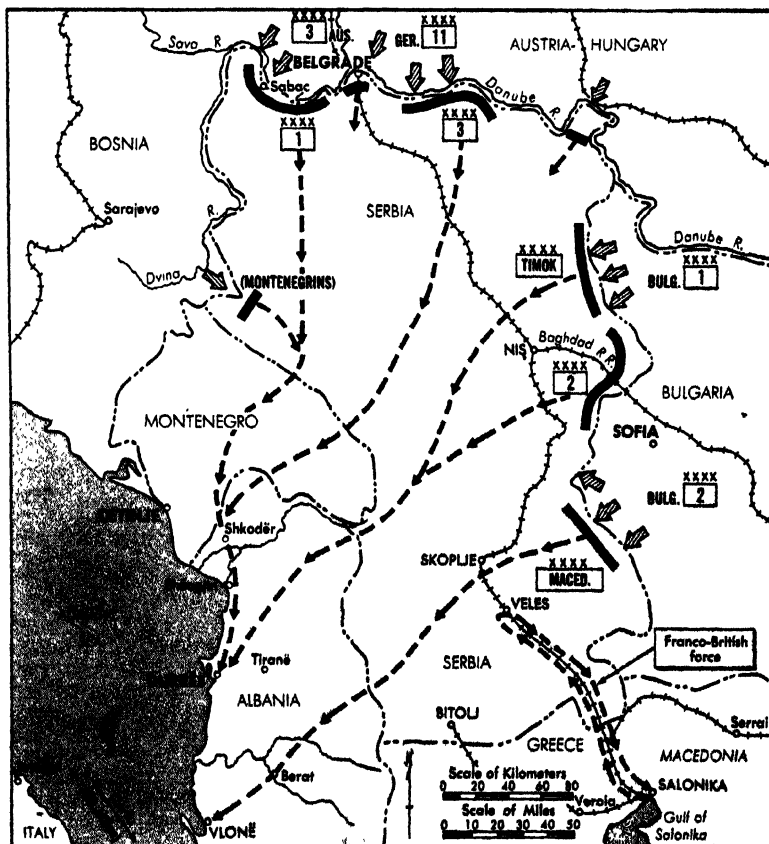

The Bettmann Archive

Peter I watches defeated Serbs retreat (November 1915).

Serbs into Albania, but she was stopped by both Germany and Austria, which did not want her to possess a port on the Adriatic. Similarly, to prevent Austria and Bulgaria from gaining a port on the Aegean Sea, the Germans precluded their advance to Salonika to clear the Allies from Greece.

Rumanian Intervention.—Rumania's resources of grain and petroleum placed her in the enviable position of being wooed by two suitors. Allied and German competitive buying increased her wealth, but as time went by, it became more and more difficult for her to remain neutral. Ambitious to expand her territory, she eyed the tempting bait of Bucovina, the Banat of Temes-

CONQUEST OF SERBIA, 1915. In October 1915, a combined German-Austrian-Bulgarian offensive was launched against Serbia to open the vital Baghdad Railway. The Serbs, greatly outnumbered and forced to defend themselves on a vast front, were soon overwhelmed. A small Franco-British force advanced from Salonika to help the Serbs, but was turned back by superior Bulgarian forces. In one of the most harrowing retreats in history, 150,000 Serbs finally reached the Adriatic Sea, from where they were transported to the island of Corfu. They were moved to the Salonikan front in 1916, and played a key role in defeating the Bulgarians and regaining their homeland.

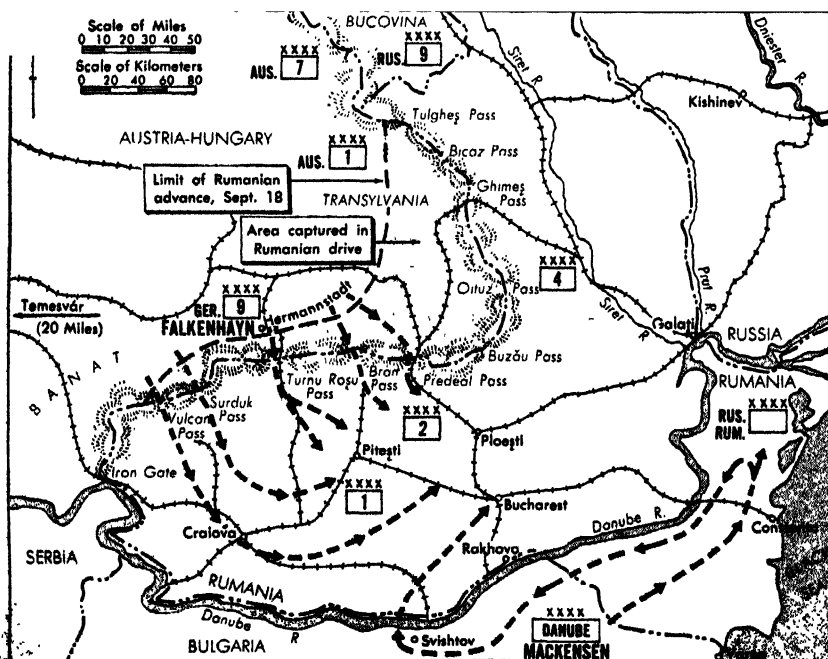

war, Maramures, Crisana, and Transylvania, which the Allies offered for her active participation in the war. Germany was at a disadvantage in bartering, for the areas desired by Rumania belonged to her own allies. In mid-1916 the situation seemed favorable to the Rumanians: Germany was faltering at Verdun, and the Allies were advancing on the Somme; Austria was bogged down in her Italian venture; Gen. Aleksei Brusilov's offensive on the southern Russian front was forcing the Germans back; and the Allied Salonika armies were preparing to invade Bulgaria from Greece. If Rumania now struck south in conjunction with the northward drive of the Salonika forces, the chances of crippling Bulgaria and of cutting the Baghdad Railway to Turkey were excellent. Instead, for two months she bargained with the Allies for further concessions and finally entered the war on Aug. 27, 1916. By then the situation had changed, and the Central Powers had ample troops available to send against Rumania. The latter's political maneuvers had been observed closely by the Germans, who anticipated her entry into the war and had prepared suitable countermeasures. Mackensen, in command on the Bulgarian front, was ordered to organize an army from the available German, Bulgarian, and Turkish forces. The German Ninth and Austrian First armies were directed to concentrate their forces on the Transylvanian frontier, while to the north the Austrian Seventh Army faced the Russian Ninth Army across the border. The concentration of the armies in Transylvania was to be completed by September 30, the earliest date on which it was anticipated that Rumania would declare war.

Despite Allied pressure to join in operations with the Salonika forces to isolate Turkey, the Rumanians decided to realize their dream of regaining Transylvania, a venture that would have little effect on the final outcome of the war. They had mobilized 560,000 men and organized them into four armies and a small reserve. The First.

Second, and Fourth armies were to advance across the mountains into Transylvania, while the Third Army protected the border against Bulgaria. The greatest weakness of the Rumanian Army was its shortage of matériel. There was a dearth of rifles, machine guns, artillery, and signal equipment. Moreover, with neither combat planes nor antiaircraft artillery, Rumania was at the mercy of the Central Powers in the air. Lacking factories to manufacture military supplies and unable to import them from the belligerent countries, she went to war with a scant six-week supply of munitions, relying on her allies' promise of shipments of 300 tons daily through Russia and the Black Sea. Additional Allied aid was promised: energetic Russian action against the Austrians, particularly by the Ninth Army; reinforcement by three Russian divisions on the day war was declared; and an Allied drive northward from Salonika to divert Bulgarian attention.

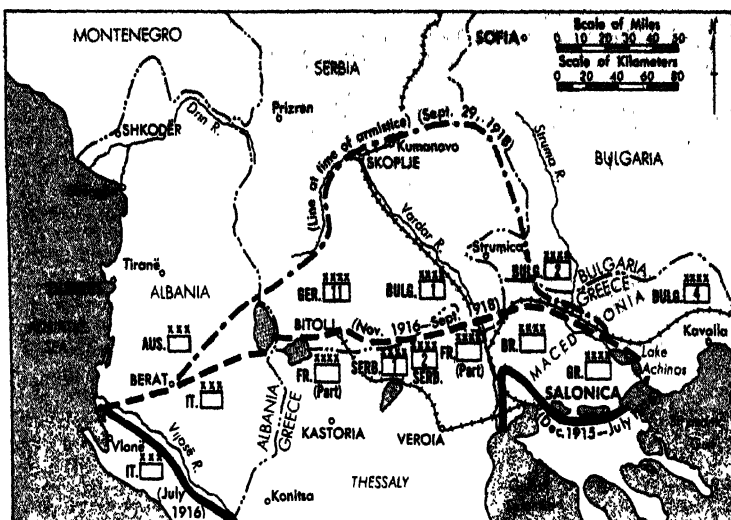

The Rumanian attack toward Transylvania began on August 28. Earlier than had been expected, it caught the German Ninth and Austrian First armies off balance. The Rumanians advanced slowly but steadily, hampered by poor roads and destroyed bridges. The mountains could be crossed only through the passes, some of which were 40 miles apart, so that the armies were divided into many groups scattered over a 200-mile front without lateral communications. Resistance gradually increased, as Gen. Erich von Falkenhayn's German Ninth Army and the Austrian First Army got into position. By mid-September, after an advance that extended about 40 miles in the center, the Rumanian offensive was brought to a virtual standstill.

At this time the situation on the southern front had become critical. Mackensen, who had been ready and had crossed from Bulgaria into Rumania on September 1, had advanced far enough to threaten the capture of Constanta, Rumania's sole port of entry on the Black Sea.

FALL OF RUMANIA, 1916
Rumania entered the war in August 1916, at a time when the Central Powers were not pressed elsewhere and could concentrate their forces against her. The Rumanians advanced to regain their treasured Transylvania—a venture which would have no effect on the outcome of the war—and made some progress. Soon Austro-German resistance stiffened and brought the advance to a halt. Then co-ordinated offensives by Field-Marshal August von Mackensen's Army of the Danube (Germans, Bulgarians, and Turks) from the south and Gen. Erich von Falkenhayn's German Ninth Army from the north overwhelmed the Rumanians and the Russians assisting them, and drove them into northeastern Rumania with a loss of 400,000 men. For all practical purposes, Rumania was eliminated from the war.

SALONIKAN FRONT, 1918. The Salonikan front was established in 1915 to help the Serbs, but Allied troops arrived too late and in too little strength to prevent the fall of Serbia. The Allied forces were built up steadily and engaged in limited offensives during 1916 and 1917, without gains of consequence. In September 1918, under energetic leadership and aided by the exhaustion of the Central Powers, a successful offensive was launched which broke the Bulgarians and forced them to seek an armistice. The Serbian Army, transferred from Corfu, played a major role in the successful operations on the Salonikan front.

and the railroad leading inland from it. Three Russian divisions moved south to defend the railroad and the city, while the Rumanian Third Army, three divisions from the Transylvanian front, and a Serbian volunteer division were rushed to the scene. Formed into an army under a Russian commander, these units temporarily stopped Mackensen short of the railroad. On October 20, the German commander, reinforced by two Turkish divisions and with his entire army well equipped, resumed the offensive. Low on ammunition and plagued with supply difficulties, the Russo-Rumanian army was forced back. On October 23, Mackensen captured Constanta and the railroad. Leaving part of his force in a strong position north of the railroad, he moved the rest to Svishtov, where it would be in a position to cooperate with Falkenhayn's drive into Rumania.

Meanwhile, Falkenhayn had pushed the Rumanians back through the mountain passes and was preparing a major offensive. He had no time to lose, for the approaching winter would seriously interfere with the movement of heavy guns and supplies through the mountain passes and would immobilize his army. Therefore, he struck on November 10. The Rumanians fought stubbornly and well, but their leaders were inexperienced, and supplies and munitions were low. (Of the 300 tons of ammunition scheduled to be delivered daily by the Allies, only 30 tons actually arrived.) On November 23, Mackensen launched an attack from the south to join Falkenhayn. Relentlessly, the two German leaders forced the Rumanians back. The latter attempted two attacks across the Danube against Mackensen to prevent his juncture with Falkenhayn. The first, in early October, was disrupted by a sudden flood; the second, in early December, was initially successful and resulted in the capture of 3,000 prisoners, but Falkenhayn sent troops to attack the Rumanian flank and rear, and the Rumanians fell back in panic. By early January, the Rumanian Army, now numbering only 150,000 men, had been driven behind the Siret River in eastern Rumania, where it was saved only by bad roads and torrential rains, which forced the Germans to end their pursuit. Rumania had lost 400,000 fighting men and had

been eliminated as an effective ally. Her vital granaries and oilfields, damaged but not destroyed, were now in the hands of the Central Powers.

Greece and the Salonikan Front.—Greece was obligated by a 1913 treaty to come to the aid of Serbia if the latter were attacked by Bulgaria. By the terms of the treaty, Serbia was to provide 150,000 men for the Bulgarian front, but she could not do so because of the German and Austrian concentrations on her northern frontier. Although the Greeks consequently refused to enter the war, Premier Venizelos' suggestion that the Allies provide the 150,000 men was agreed to, and Allied troops began to land at Salonika on Oct. 3, 1915. The Central Powers commenced their advance into Serbia on October 7. The Allied Salonika force under French Gen. Maurice P. E. Sarrail, which was called the Armée d'Orient, started north on October 12. It comprised only 40,000 British and French troops and, as we have seen, was soon cut off from the Serbs by the Bulgarians and pushed back to the Greek border. Had the Bulgarians not been ordered by the Germans to stop at the frontier, they probably would have destroyed the Allied force and its base at Salonika. On the other hand, had the Greek Army of 350,000 men joined the Allies, Serbia might have been saved.

Greek political affairs now troubled Sarrail. Pro-German King Constantine I (his wife was the kaiser's sister) had denounced Venizelos' agreement, forced him to resign on October 5, and repudiated the treaty with Serbia. Sarrail had intended to retain his position on the Greek border, but two Greek corps stood between him and his base at Salonika, and in view of the king's attitude he withdrew to that port. The base was now greatly expanded and strongly fortified, and eventually became known as the "Bird Cage." Allied troops trickled in steadily, and by July 1916 Sarrail had about 250,000 men, including the re-formed Serbian Army, which had arrived from Corfu.

Not only was Sarrail's political situation obscure, but his command relationships were fraught with friction. The various governments persisted in sending instructions directly to

Captured by Bulgarians in 1915, Bitolj (Monastir) was retaken by Allied troops in 1916; the front remained nearby until 1918. Here Bulgarians attack the town.

their contingents; there were five of these, and Sarraill experienced much difficulty in exercising authority and control. In addition, each arrival or movement of troops was reported by Athens to Berlin, so that the Central Powers were apprised of every detail of the Armée d'Orient. When Rumania entered the war in August 1916, Sarraill moved to protect the Rumanian mobilization by pinning down the Bulgarians. He attacked with his left wing (mostly Serbs) on September 10, while his right wing remained on the defensive. His total force, now called the Armées Alliées en Orient, numbered 350,000. The left wing gained spectacular successes and drove the Bulgarians from Bitolj (Monastir), but the right wing was forced back by the Bulgarians. Bickering between Sarraill and his subordinates and poor support of the Serbs by the other allies had made an important victory impossible.

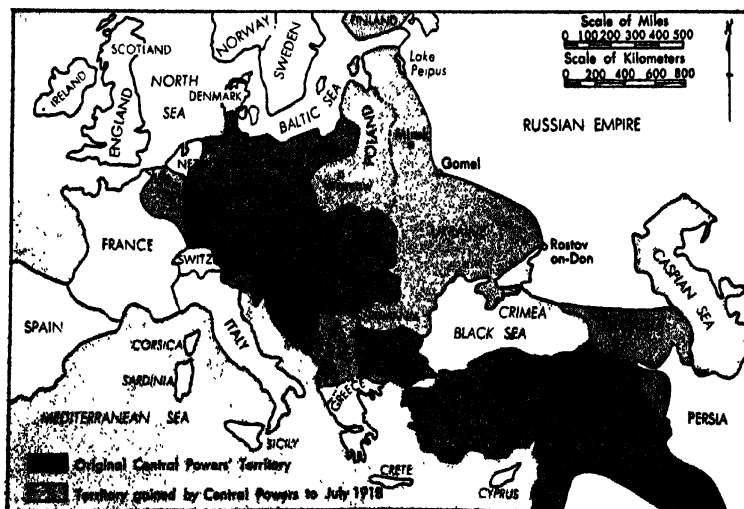

Meanwhile, a smoldering revolutionary movement among the Greeks of Macedonia erupted against their pro-German king and his ministers. The spark was provided by arrangements made by Athens to allow the Bulgarians to take over fortifications at the border from Greek troops. Salonika had a real revolution, and Greek soldiers

and civilians renounced their allegiance and subdued the royalist minority. Venizelos and the commander of the Greek Navy established a revolutionary government in Crete, and as the revolution spread, soldiers and police joined the Allies. The city of Salonika was virtually under Sarraill's control; the Allies took charge of the Greek Fleet, the railroads, and the port of Piraeus; and marines landed in Athens and censored its newspapers.

In May 1917, Sarraill attempted another offensive, but the Serbs, still angry because they had not been properly supported in the 1916 attack and torn by dissension, caused the operation to falter before any appreciable success had been gained. In June, the ineffective negotiations between the Allies and Greece came to a head. Célestin Jonnart arrived in Greece as Allied high commissioner, and French troops landed on the Isthmus of Corinth. Jonnart demanded the abdication of Constantine, who yielded the throne to his second son, Alexander, and sailed on a French vessel for Germany. Venizelos was recalled to power, and on July 2 the new government declared war on Germany and Bulgaria. The addition of the Greek Army permitted the transfer of British divisions needed in Palestine. In December, the incompetent Sarraill was succeeded by an energetic commander, Gen. Marie Louis Adolphe Guillaumat. When Guillaumat was recalled to the western front in July 1918, he was replaced in turn by Gen. Louis Franchet d'Esperey, an excellent soldier.

Fall of Bulgaria.—When the German drives of early 1918 on the western front failed and the Allies took the offensive, the Germans bled all their other fronts of men and equipment to bolster their defense. Only the staff and a few small units were left with their Eleventh Army, and the Bulgarians had to supply divisions to fill it out. Since Austria needed all her strength for the Italian front, Bulgaria was virtually alone and ripe for collapse. Franchet d'Esperey had 350,000 combat troops who were well equipped and high in morale. They were opposed by 310,000 men, predominantly Bulgarians, who were short of food, clothing, and munitions and were low in morale.

The Allied High Command decided to launch

MAXIMUM EXPANSION OF CENTRAL POWERS, JULY 1918. The Central Powers controlled the greatest expanse of territory in July 1918. The Treaty of Brest-Litovsk had permitted the occupation of vast areas of the Russian Empire. Except for Greece and the southern part of Albania, all of the Balkans were under the Central Powers' control. On the western front the Germans were on the Marne River, and occupied rich northern France and all but the Northwest corner of Belgium. In Italy the Austrians and Germans occupied the rich north-eastern plain down to the Piave River.

in attack in the Balkans in conjunction with their final drive against the Germans on the western front. On Sept. 14, 1918, a heavy bombardment of the Bulgarian lines began, and an initial striking force of six Serbian and two French divisions attacked. A general assault was delivered on September 15 and 16 by British, Serbian, French, Greek, and Italian troops. The offensive was an amazing success from the start. By September 17, the Allies had advanced 20 miles, the Serbs especially distinguishing themselves in furious charges. By September 27, the road to Sofia lay open as the remnants of the Bulgarian armies, split and demoralized, straggled homeward. The Eleventh Army was cut off and forced to surrender.

It was useless for the Germans to urge the Bulgarians to rally. These sturdy peasants were finished with war and were intent on returning home for the harvest. On September 26, Bulgarian emissaries arrived under a flag of truce to request an armistice. Granted on September 29, it provided for demobilization of the Bulgarian Army, evacuation of all occupied territories, surrender of means of transportation, and permission for the Allies to use Bulgarian territory for further operations. No such operations were necessary since both Germany and Austria were in their death throes, and the war ended on November 11.

The Allied Salonika venture remains a controversial subject. Some mark it as a waste of men and resources, while others believe that it had great strategic significance. When its accomplishments are considered, however, the former view appears to be the more logical. The campaign failed to achieve its principal objective—the severance of German-Turkish communications—in time to have any effect on the war, and it did not pin down enough German and Austrian troops to affect adversely their operations in other theaters. Its sole achievement was to defeat the Bulgarians, who in any event would have fallen with the Germans and Austrians a month later. It did protect Greece, but the Greeks themselves were capable of holding their own against the Bulgarians.

For three years, hundreds of thousands of Allied troops suffered in the malaria-infested Salonikan area. British official records list during the campaign 481,262 hospital cases, of which only 18,187 were wounded; French official records in the brief period June–August 1916 show 35,122 hospital cases, of which 672 were wounded.

13. The War at Sea

From the naval point of view, World War I was essentially a struggle between a group of powers which had to obtain their means of waging modern war from within the heart of the European continent and another which were able to obtain these means overseas. For a time, the

second group did include Russia, but that nation collapsed when the maritime powers, Great Britain and France, were unable to overcome geography and reach her with waterborne resources.

Great Britain lies like a breakwater across the sea communications of Germany, whose access to the maritime world is through the North Sea, the Strait of Dover, and the English Channel, waters dominated for centuries by the British Navy. British trade routes, on the other hand, were free from direct German naval threat with the exception of those to Scandinavia. Nevertheless, the geography of the peninsula of Europe enabled Germany to keep the main water routes to Russia closed despite British seapower.

The war at sea in World War I became primarily a contest between the navies of Great Britain and Germany. The former received assistance from the French and United States navies, but the navies of Italy and Austria did little more than counter each other in the Adriatic Sea. The Russian Navy, weak in morale, was locked in the Baltic and Black seas, while the navy of Turkey consisted mostly of two ships of the former German Mediterranean Squadron and their crews. The navy of Great Britain had been its first line of defense for centuries, but the German Navy was a relatively new creation, a product of German nationalism and overseas aspirations. It was essentially a surface navy, designed to challenge the seapower of Britain in the narrow waters of the North Sea. In the end, it contested this power on the oceans with the submarine and came close to winning the war.

Prussia began laying the foundations of German naval power in 1853–1854, when it purchased from Oldenburg a small piece of territory on shallow Jade Bay in the southeastern corner of the North Sea. A port, Wilhelmshaven, was constructed there at great expense and completed in 1869. By annexing Holstein in 1864 after the war with Denmark, Prussia also obtained the excellent port of Kiel. A canal between Kiel and the Elbe River estuary connecting the Baltic and North seas was completed in 1895. By 1914 this canal had been deepened and widened so that the largest ships of the German Navy could transit it.

The growth of the German Navy was stimulated by trade competition with Great Britain and by a growing antagonism toward that strong maritime power. Bills for increased naval construction were enacted in 1898, 1900, and 1905, the last calling for a fleet built around 40 battleships to be completed by 1917. A navy that could challenge Great Britain was thus created over opposition of the Imperial General Staff and of liberal elements in the Reichstag. It was primarily the work of Adm. Alfred von Tirpitz, who was the first trained seaman to serve as secretary of state for naval affairs, and who had the support of Emperor William II.

This expansion of the German Navy could not help but affect Great Britain. While the modern British Fleet had been building since 1889 as an answer to the current naval ambitions of France and Russia, these two countries no longer presented a threat to Britain after 1904. Instead, the rising German Navy forced the British into an alliance with them. The development of the Triple Entente (q.v.) permitted the area of activity of the British Fleet to be transferred from the Mediterranean Sea and the English Channel to the North Sea, and a major naval

shipbuilding program was inaugurated to maintain a 60 percent superiority over the Germans. The armament and speed of warships were improved, and oil was adopted as fuel. This progress culminated in the design of the five powerful battleships of the *Queen Elizabeth* class, which were armed with 15-inch guns and could make 27 knots.

In both Britain and Germany the capital ship monopolized naval planning to the exclusion of more modern types, such as the destroyer, the submarine, and the airplane. The British Navy stressed speed and the largest possible caliber of guns in order to retain initiative and the offensive, while the Germans emphasized hitting power and strong construction at the expense of speed and radius of action, which they considered secondary for a navy built primarily for attrition operations in the North Sea.

The skill of their naval designers and the competence of their officer corps made the German Navy, ship for ship, a formidable rival to that of Great Britain. In many technical features of gunnery and damage control, the Germans were superior. War planning in both countries, however, left much to be desired. Navies had gone through a long period of technological changes but had experienced little combat to test the strategic and tactical effects of these changes.

In Germany, Admiral von Tirpitz, in his efforts to keep the navy independent, had allowed the General Staff to ignore his service in their war plans. No provisions were made for such joint operations as seizing the Continental side of the English Channel or stopping the flow of troops and supplies from England to France. At the same time, the German Navy, in its concentration on the capital ship, failed to develop the full potentiality of the torpedo, the mine, and the submarine, obvious weapons of a lesser naval power.

In Great Britain the two services also made their war plans separately. The admirals expected to conduct a close blockade of Germany and to employ ground forces in amphibious operations on the German coast, ignoring the development of steam navies and high-powered ordnance, which would make such plans difficult to carry out. They also ignored the fact that British military leaders were thinking about something entirely different. The latter, despite their country's control of the seas, were worried about invasion, and they made plans for employing their forces offensively, not in exploiting the mobility and freedom of action of seapower but rather in reinforcing the French Army on the Continent. This revolutionary change in British strategy stemmed from staff conversations with the French that began in 1906. Although these conversations never reached the form of agreements or plans, they committed the small British regular army of seven divisions to employment in France in the event of war with Germany. When war finally came, these seven divisions were followed by millions of men.

Early Actions.—The opening of the war found Winston Churchill as first lord and Prince Louis of Battenberg as first sea lord, the highest civilian and naval positions in the Admiralty. Adm. Sir John Jellicoe (later 1st Earl Jellicoe) had command of the British Grand Fleet. This fleet was at its war base in Scapa Flow in the Orkney Islands, while the German High Seas Fleet cut short its cruise to Norway to return to the Jade.

Since both fleets were built around battleships and battle cruisers, it is necessary only to compare figures in these types to get an idea of comparative naval strengths. The Grand Fleet had 19 dreadnoughts, 8 predreadnoughts, and 4 battle cruisers, while the High Seas Fleet had 13 dreadnoughts, 8 predreadnoughts, and 4 battle cruisers. In the Mediterranean the British had 3 battle cruisers, and the Germans 1. A total of 8 cruisers and 96 torpedo craft guarded British coastal areas, especially the Strait of Dover. The British had 24 new and 31 old submarines, while the Germans had 10 new and 18 old ones.

The first naval operation of the war, which took place in the Mediterranean, was a decided victory for the Germans. This was the escape of the battle cruiser *Goeben* and the light cruiser *Breslau* to Constantinople. Vice Adm. Wilhelm A. T. Souchon boldly took action on his own initiative while the British commanders were receiving conflicting instructions from the Admiralty. The two ships were added to the Turkish Navy, a step which had a decided effect in bringing Turkey into the war on the German side.

The British took the initiative in the first surface action in the North Sea. On Aug. 28, 1914, a sweep by five battle cruisers toward Helgoland resulted in a light-force action that cost the Germans three cruisers. This action set the pattern of ambush and hit-and-run raids that characterized North Sea fighting throughout the war.

A few weeks later, on September 22, the German submarine *U-9* sank three British cruisers, the *Cressy*, *Hogue*, and *Aboukir*, off the coast of the Netherlands. This action made a deep impression on both naval commands. It caused the withdrawal of the Grand Fleet to the north of Ireland, while bomb and net defenses were installed at Scapa Flow. The fleet was therefore 300 miles away from the North Sea when the German Army captured Antwerp and almost took the Channel ports. This series of setbacks, combined with a lack of the action that the British public had expected from its fleet, caused the resignation of Prince Louis of Battenberg and the reappointment of the 1st Baron Fisher, who had been first sea lord from 1904 to 1910. On Nov. 2, 1914, the North Sea was declared a war zone and mined, and neutral shipping was instructed to proceed by certain channels or accept the risk involved. This step gave the Germans a precedent for justifying the war zone which they declared around Great Britain in February 1915 in their all-out submarine campaigns.

A major task of the British Fleet, second only to the security of the British Isles themselves, was the protection of overseas trade and of troop movements against the German cruisers that were on foreign stations when the war commenced. The *Emden*, which had been detached from the German Far East Squadron to raid in the Indian Ocean, sank 15 ships before she was finally run ashore by the Australian cruiser *Sydney*, and the *Karlsruhe* in the West Indies destroyed 17 ships before she was destroyed by an internal explosion. Meanwhile, other raiding cruisers destroyed a few more British ships.

The German Far East Squadron, under Vice Adm. Maximilian von Spee, posed the principal threat to British shipping and convoys in the Indian and Pacific oceans. This squadron, consisting of the armored cruisers *Scharnhorst*

and *Gneisenau* and the light cruiser *Nürnberg*, crossed the Pacific and was joined by two more light cruisers, the *Leipzig* and *Dresden*. Off Coronel, Chile, on Nov. 1, 1914, it met an inferior British squadron, consisting of the armored cruisers *Good Hope* and *Monmouth*, the light cruiser *Glasgow*, and the auxiliary cruiser *Otranto*, under Rear Adm. Sir Christopher Cradock. The Germans sank the two armored cruisers in a short action, and the other British ships made their escape.

This disaster brought a quick reaction from Lord Fisher. The battle cruisers *Inflexible* and *Invincible* were sent to the South Atlantic, where they were joined by four other cruisers. In the meantime, the German squadron had entered this area on its way home. The British ships were coaling at the Falkland Islands on December 8, when Admiral von Spee, unaware of their presence, decided to raid the British station. The result was that the Germans were caught in a running fight with a superior force. Only the *Dresden* escaped, and she was found and destroyed three months later off the Juan Fernández Islands.

By December 1914, therefore, the German surface raider threat was ended. Conditions had changed since the days of the *Alabama* in the American Civil War. Dependence on coal plagued the German cruisers, and radio telegraphy made it relatively easy to track them. The submarine would be the commerce raider of the future.

In the North Sea the German battle cruisers had made a sweep in November 1914, and on December 16, they bombarded Scarborough, Hartlepool, and Whitby on the English coast. These operations were undertaken for the purpose of drawing out and engaging detached British forces. On Jan. 24, 1915, these ships made a sweep to Dogger Bank, two thirds of the way across the North Sea, hoping to catch British light forces patrolling in the area. A short time before, however, the British had obtained a code book which had been jettisoned from a German cruiser grounded in the Baltic and recovered by a Russian diver. Since the Germans never radically changed their codes, the British thereafter were able to secure advance information on their operations.

Rear Adm. David Beatty with five battle cruisers, the *Lion*, *Tiger*, *Princess Royal*, *New Zealand*, and *Indomitable*, and a light cruiser squadron, thus could leave the base at Rosyth in the Firth of Forth just a few minutes after Rear Adm. Franz von Hipper, with three battle cruisers, the *Derfflinger*, *Moltke*, and *Seydlitz*, and the armored cruiser *Blücher*, cleared the Jade. When the Germans reached a point about 30 miles north of Dogger Bank and 180 miles west of Helgoland at 7 A.M., they found the British waiting for them. Hipper immediately reversed course and sped for his base with the British in pursuit. Shortly before 9 A.M., the British ships began to come within range and opened fire on the *Blücher*, the last ship in the German column. Fire was later shifted to other German ships, and the *Seydlitz* was seriously damaged. The Germans concentrated on the *Lion*, the leading British ship, which was struck several times, causing her to fall out of line. Poor fire distribution and faulty communications on the part of the British allowed the three battle cruisers to escape. The *Blücher* was sunk,

but not before a British photographer obtained one of the best naval photographs of the war. The Germans profited from this defeat, for they strengthened the side plating and turret tops of their battle cruisers and improved the protection of the magazines and ammunition supply. These changes were to pay large dividends a year and a half later at Jutland.

Dardanelles Campaign.—By 1915 the war on the western front had stabilized into one of grinding attrition that was to absorb millions of men and such vast quantities of ammunition that the economies of all countries almost collapsed under the strain. Since Britain was then the only Allied power that held the initiative, some British leaders looked for means of outflanking the German position and establishing communications with Russia. Lord Fisher wanted a combined naval and military attack in the Baltic and started a building program for such a great amphibious undertaking. This plan, however, was not considered seriously by anyone else. It could succeed only at enormous cost, for the Germans feared such an attack and would have resisted it furiously.

An alternative was opening the Dardanelles. Churchill, who at first espoused the Baltic plan, now shifted his interest to what appeared to be a less costly project. French military leaders and some British opposed the operation, which they feared would withdraw or withhold troops from France. The 1st Earl Kitchener, who was the secretary of state for war, wanted to strengthen Russia but refused at this time to make any troops available. Churchill accordingly agreed to a primarily naval attack.

Fisher would agree to the Dardanelles operation only if certain conditions, including the use of troops, were fulfilled. Churchill solved his dilemma by going over Fisher's head to the naval commander in the area, Vice Adm. Sackville H. Carden, who provided a plan that combined reduction of the Dardanelles forts by naval gunfire with minesweeping. Obsolete French and British battleships, whose loss would not affect the seapower balance, were to be used. The new battleship *Queen Elizabeth* was added, and an enthusiastic Churchill could see the Dardanelles forts falling successively before her 15-inch guns.

Carden's plan had made no provision for dealing with mobile artillery, and Churchill assumed that the British intelligence reports were

correct. These, however, gave information only on the forts and none on the action of Gen. Otto Liman von Sanders, head of the German military mission to Turkey. Liman von Sanders realized that, in addition to the forts, the mine fields would have to be covered by mobile artillery. He bypassed Constantinople in the movement of this artillery and, by keeping its movement secret even from the German commander of the Dardanelles defenses, prevented British intelligence from learning of its existence.

After the combined naval attack was agreed on, British leaders hurried the project and failed to make proper preparations, especially for minesweeping. The first attack of the Franco-British squadrons on the outer forts was made on Feb. 19, 1915, and a second attack followed on February 25. The outer forts were reduced, but after the initial bombardments it became evident to Carden that amphibious troops were needed. Churchill ignored his requests, insisting that he go on with the original plan. Operations were renewed on March 4, and were continued for two weeks, with the big ships bombing by day and the minesweepers attempting to sweep at night. The latter could make little progress against the current, however, and suffered heavily from the field guns.

Carden's health finally broke down, and he was relieved by Rear Adm. Sir John de Robeck, who decided on an all-out daylight bombardment with minesweeping operations under its cover. This attack was made on March 18. Things went well until early afternoon. The forts appeared to have been silenced, but when the minesweepers proceeded to their work, the field guns drove them back with heavy losses. A French battleship, *Bouvet*, had already been sunk by an unswept mine. De Robeck recalled his heavy ships, and in the retirement another battleship and a battle cruiser were destroyed by mines, while a second cruiser was damaged. Two other ships were put out of action by gunfire. De Robeck ordered a general withdrawal.

The whole problem was then reappraised, and a purely naval attack was abandoned. The campaign against Constantinople was to go on, however, with the army now given the main task and the navy assisting it. An army force under Gen. Sir Ian Hamilton, consisting of a regular division from England, the Australian and New Zealand troops, a naval infantry division, and a few French, had been assembled in Egypt. This force was not prepared for assault amphibious operations, however, and a month was lost in re-loading. Liman von Sanders thus had the time he needed to get ready for the attack, which was made on the Gallipoli Peninsula on April 25, 1916. The whole campaign eventually failed, the Allies suffering their most costly setback of the war. The result was a shakeup in the British cabinet that included the removal of Churchill.

See also section 11. *Turkish Campaigns.*

Battle of Jutland.—The next major naval action, the Battle of Jutland (or Skagerrak, as it was called by the Germans), took place on May 31–June 1, 1916. The war had been in progress for almost two years before this main fleet action toward which the building and training of navies had been directed for a generation finally took place. The two fleets had been acting on the defensive, but events in early 1916 brought a change in their attitude. Russia, blockaded by Germany, was suffering more than Germany,

blockaded by Britain. To break this blockade the Allies would have to gain control of the Baltic, and before this could be done the High Seas Fleet had to be destroyed. The Grand Fleet now had suitable bases along the east coast of Britain closer to Germany and was in a better position to press for the necessary decisive action. On the German side command of the High Seas Fleet had been taken over by a new man, Reinhard Scheer, a choice of Tirpitz and an advocate of offensive action. Scheer planned a series of raids in which all forces, including submarines and zeppelin airships, would be used. The purpose of these raids was to draw out detachments of the British fleets, which would be attacked by submarines and surface forces.

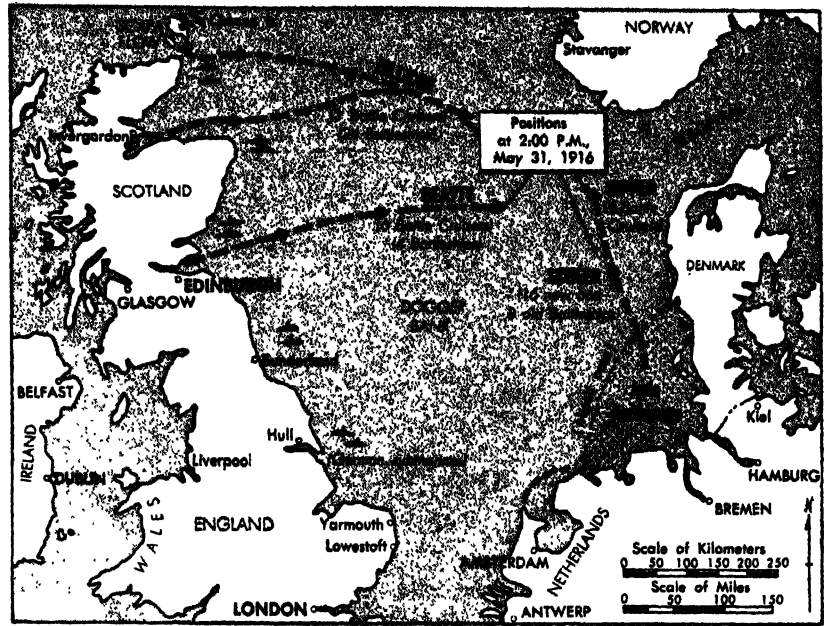

The first German raid was made by a force of battle cruisers, which on April 25, 1916, bombarded Lowestoft and Yarmouth. Scheer next planned a bombardment of Sunderland, but bad weather caused him to make instead a sweep to the north to raid Allied shipping off Scandinavia and possibly attack the British blockading force, the 10th Cruiser Squadron. If necessary, he could withdraw via the Skagerrak.

The High Seas Fleet, with 16 modern and 8 old battleships under Scheer and 5 battle cruisers under Hipper, sortied from the Jade for this operation in the early hours of May 31, and headed north with Hipper about 50 miles ahead of Scheer. Since the British were still reading coded German radio dispatches, the Grand Fleet got to sea even before the Germans. The main body under Jellicoe, which consisted of 24 dreadnoughts and 3 battle cruisers with attached light forces, left Scapa Flow and Invergordon at about 10 P.M. on May 30. At the same time, the scouting force under Admiral Beatty, consisting of 6 battle cruisers and 4 modern battleships of the *Queen Elizabeth* class, left Rosyth. Both groups proceeded eastward separately. At 2 P.M. on May 31, Beatty was to be 70 miles south of Jellicoe, and if at this time he had not sighted the Germans, he was to turn north and join the commander in chief. Neither Jellicoe nor Scheer knew that the main body of the other's fleet was at sea, for Scheer had taken the precaution of having the radio guard ship in port acknowledge all messages addressed to him.

Shortly before Beatty was to turn north, one of his cruisers sighted smoke to the east, which was found to come from a Danish freighter that had been stopped by two German destroyers. This contact brought on the battle, for at 2:20 P.M. Beatty turned southeast and increased speed, hoping to get between the enemy and his base. Meanwhile, Hipper, on learning of the contact, turned to a northwesterly course to develop it. The light forces screening Beatty and Hipper had by this time been drawn off to the north, so that at 3:25 P.M. the battle cruiser squadrons sighted each other without previous warning. Beatty's 4 battleships were several miles astern of him.

To prevent the British from getting between him and Scheer, Hipper reversed course. With both forces on parallel courses, fire was then opened at about 17,000 yards and continued for an hour. The German fire was more effective, sinking the battle cruiser *Indefatigable* at 4:06 P.M. and the *Queen Mary* at 4:26 P.M. Beatty's flagship, the *Lion*, lost a turret, as did the German *Seydlitz*. Other ships on both sides also received hits. The Germans at this time were

BATTLE OF JUTLAND, 1916:
OPENING PHASE. The German High Seas Fleet sortied from its base in the Jade Bay anchorage to raid Allied shipping off Norway and attack the British blockading force. The British, by decoding German radio messages learned of this move, and their Grand Fleet put to sea to intercept it. By 2 P.M. on May 31, the two fleets were in the positions shown. At this time, neither Adm. Sir John Jellicoe nor Adm. Reinhard Scheer knew that he was confronting his opponent's main fleet.

leading the British battle cruisers toward the main body. The German battleships were sighted at 4:33 P.M. by the 2d Light Cruiser Squadron under Commodore William E. Goodenough, who in Beatty's van was alone properly performing the duties of a light force. Beatty held his course until 4:40 P.M., when, with the High Seas Fleet in sight, he turned north to come close to Jellicoe. His 4 heavy battleships, which by this time had taken the German battle cruisers under fire, continued on a southerly course until 4:57 P.M., passing Beatty and covering his rear. The pursuit north lasted until 6 P.M., during which time Goodenough, under fire of the German battleships, nevertheless maintained contact and sent accurate reports.

The battleship squadrons of the Grand Fleet in the meantime were approaching on a southeasterly course, while the battle cruisers, under Rear Admiral Sir Horace Hood, were considerably to the east. The choice of deployment of the battleships from a cruising formation of line of divisions into a long line ahead had to be made on either the right-hand or the left-hand division. Since this decision depended on the location of the German battlelines, Jellicoe delayed his deployment signal until 6:14 P.M., when he finally obtained the correct position of the German main body from Beatty. He deployed his squadrons to the left and took an easterly course to get between the German Fleet and the coast. This maneuver took about 20 minutes, during which time Beatty's cruisers crossed the line of deploying battleships and took up stations in their van. Hood took position ahead of Beatty, while Beatty's 4 battleships took position in the rear of the battleship squadrons of the Grand Fleet.

The German main body, led by Hipper, was then on a northeasterly course. Hood's battle cruisers first came into contact with the Germans and took them under a heavy fire, which put the *Lützow*, Hipper's flagship, out of action at 6:33 P.M. Hood's flagship, the *Invincible*, was herself sunk by fire from the German battle cruisers

and the leading battleships.

The battleships on both sides were now beginning to engage with the Germans in a bad position, the whole British fleet crossing their van. By 6:26 P.M. the German battle cruisers in the lead were forced to turn away to prevent being caught in a trap. At 6:35 P.M., Scheer ordered his famous *Gefechtskehrtwendung* (emergency retirement by ripple movement from the rear), a maneuver which his ships had often practiced, and which was successfully accomplished despite an elbow in the line.

In the poor visibility, Jellicoe did not see this turnaway and lost contact with the enemy. Keeping to his purpose of getting between the Germans and their base, however, he changed from an easterly to a southeasterly course. Scheer, having successfully extricated himself, for some unknown reason once more reversed course and returned to the battle on an easterly heading, almost at right angles to the British battleline, which in the meantime had changed to the south.

The German Fleet was no sooner turned on an easterly course again than it was reported at 7:00 P.M. by the ever-watchful Goodenough. A few minutes later, at 7:05 P.M., the British battle cruisers commenced firing, and some of the battleships shortly followed suit. The range was down to 7,500 yards, and visibility conditions were now most favorable to the British. At 7:13 P.M., Scheer again extricated his battleships from a bad position by an emergency retirement behind the continued engagement of his battered battle cruisers and a destroyer torpedo attack. The torpedo attack was successful, for at 7:21 P.M. Jellicoe ordered a turnaway of 45° from south to southeast. The British battleship divisions remained on this course for 14 minutes, until the German torpedoes passed their line, whereupon Jellicoe again returned to a southwesterly course. The turnaway maneuver lost Jellicoe his chance to destroy the German Fleet.

After breaking contact, the Germans changed to a southerly course. From 8 to 9 P.M., the

rents and neutrals. Because of this, there has grown up a body of custom, generally called international law, for the conduct of sea trade in wartime. This law gives a belligerent the right to capture an enemy's merchant vessels, to stop them into and from enemy ports, and to confiscate goods found at sea which are to be used by the enemy for war purposes. To accomplish these objects, a belligerent war vessel has the right of visit and search—that is, the right to stop all vessels to determine their nationality and to learn whether or not they are breaking a blockade or carrying contraband. Private goods at sea are not subject to outright confiscation, however, but must be condemned in an admiralty court, generally known as a prize court.

In the 19th and early 20th centuries efforts were made to codify this international law by agreements between the maritime nations. The Declaration of Paris (q.v.) in 1856 abolished privateering, declared that a blockade to be binding must be effective, and gave protection to all neutral goods except contraband. The Declaration of London (q.v.) in 1909 attempted to define and specify contraband. Absolute contraband was to comprise military goods and conditional contraband goods that could be put to war purposes, while free goods, including such items as raw cotton, fertilizers, and metallic ores, could not be declared contraband.

Neither the Declaration of Paris nor that of London took into account the changes taking place in modern war. Naval weapons such as the submarine, the torpedo, and the mine had made the old type of close blockade as well as visit and search at sea impossible. Under the modern concept of total war, all commodities were considered to have military value. Finally, Germany had on her land borders several Continental neutrals whose trade with her a naval force could not interdict.

New methods therefore had to be adopted by the major maritime power, Great Britain, to cut off the seaborne trade of the Central Powers, especially Germany, and to prevent the means of war in the form of goods from reaching these countries from overseas. This was finally done by a system of trade controls that was to give new meaning to the term "blockade." In this new form, economic pressure was brought to bear not so much by naval ships directly as by a system of trade restrictions which control of the sea made possible. In 1915 and 1916 these restrictions or blockade in its new form gradually evolved within the five following categories:

(1) Inspections in port replaced the visit and search of former days. The dangers of modern weapons and the size and variety of cargoes carried made the old method of inspection at sea impossible. Instead, British cruisers directed suspected neutral vessels into ports for examination. These ports were the Downs, for trade through the English Channel; and Kirkwall in the Orkney Islands, for the northern route, where a cruiser squadron was stationed to enforce the new system.

(2) Rationing was a method by which the Continental neutrals bordering on Germany were allowed supplies sufficient only for their own use. Based on an elaborate statistical system, it was given legal sanction after a British prize court condemned the steamer *Kim* for carrying an amount of lard to Denmark far in excess of

that country's normal imports.

(3) Written clearances in the form of letters of assurance or navicerts were given to neutral ships sailing to Europe from the United States or other neutral nations. A navicert certified the contents of the cargo, thereby speeding a ship's examination. Most neutral shipping companies except those of Sweden, which were forbidden to do so by their government, cooperated with the Allies in both rationing and inspection and accepted navicerts. Sweden was still linked economically to Germany, and the Allies could not forget that it lay athwart their own lines of communication to Russia.

(4) Blacklists were publications of names of firms that were known, either through Allied intelligence or by postal and telegraphic censorship, to be trading with the Central Powers. Neutral ships were forbidden to transport their goods.

(5) Bunker control, or the issue of British coal to neutral vessels, was the club which made the other controls possible. Great Britain not only supplied coal to European countries for industrial and commercial use, but also controlled most coaling stations. (At this time, American coal offered little competition to the British product.)

By the beginning of 1916 the blockade in its new form was becoming effective. What had begun as an excellent code without machinery had become under the Ministry of Blockade an excellent machinery without a code. Shortages of fibers, oils, fats, lubricants, and fertilizers began to be felt in the Central Powers. Combined with the crop failure of 1916, they caused considerable suffering among the civilian populations, although the armed forces of these nations never experienced shortages in armaments or supplies.

When the United States entered the war in April 1917, it placed restrictions on trade that the Allies would never have attempted while it was still a neutral. Controls could now be effected at the source, and most of the machinery of the blockade could be abandoned. By the autumn of 1917 the Central Powers were deprived of all foreign supplies.

Like the blockade of the Confederacy in the American Civil War, the contribution of the Allied blockade of Germany to the final victory is difficult to assess. Victory certainly could never have been secured solely by economic encirclement, but when the armies of the Central Powers began to be defeated, the collapse came with the crumbling of civilian morale brought on by deprivations. In expanding her industrial economy before the war, Germany had come to depend too heavily on overseas trade for food and raw materials. The lesson of World War I was that she must draw these necessities from the Eurasian continent.

The blockade of Germany was essentially a form of economic warfare, but it was based on control that the British Navy had maintained for a century and more. Where the arms of British seapower could not reach, however, economic warfare broke down, as it did with Sweden in the Baltic and Rumania on the Black Sea.

German Submarine Campaign.—Germany's answer to the Allied blockade was its submarine campaign against merchant shipping. In

order to view this submarine warfare properly as a form of blockade of Great Britain, certain facts must be kept in mind:

(1) Four fifths of Britain's food, all of her raw materials except coal, and half of her iron had to be imported.

(2) British war plans had assumed that the Grand Fleet, by containing the High Seas Fleet, would maintain control of the seas and thus preserve the overseas lifeline. The Allies could therefore proceed with the blockade of Germany without fear of retaliation.

(3) Command of the sea enabled the Allies to draw on the resources of the United States and deny these resources to Germany. The United States therefore became the major and even the predominating force in the struggle.

(4) Despite the size and efficiency of the High Seas Fleet, the Germans were unable to change the prewar naval situation by surface forces alone.

(5) The submarine was singularly fitted for attacking the large concentrations of shipping in the approaches to the British Isles.

The success of the *U-9* in sinking three cruisers in a matter of minutes in September 1914 opened the eyes of German naval officers to the potentiality of the submarine, and as early as November of that year German naval authorities recommended its use against British sea trade. The German political point of view, however, was that, while there were no legal obstacles to a U-boat campaign, a decision to embark on this new type of warfare would be made only when the military position on the Continent was so secure that there could be no doubt of the eventual outcome.

By February 1915, the campaign on the western front had been stalemated, and it was apparent that the war was not to be the short one that the General Staff had planned. In November 1914, Great Britain had declared the sea approaches to Germany a war zone forbidden to merchantmen. In addition, the list of con-

traband had been extended to include even grain. The Germans knew that such economic pressure would increase, with their country becoming a fortress beset, and it was this knowledge that led them to decide to use submarine in the war against Allied seaborne trade. On Feb. 4, 1915, the waters around the British Isles were declared a war zone where (effective February 18) submarines would destroy enemy ships and neutral merchantmen would travel at their own risk.

The submarine was unable to comply with the rules of international law adopted for a war against trade by cruisers, for it could ensure its own safety only by sinking ships without warning. The German leaders failed to take into account the reaction of world opinion, especially opinion in the United States, to the changes in the rules of warfare which they were unilaterally adopting to suit the new weapon. They tried to justify their stand on the ground that Great Britain had been the first to violate international law, but they failed to recognize that British policy offered neutrals an alternative while their own presented only an ultimatum: cease trade with the Allies or risk destruction of life and property.

The one nation strong enough to dispute the new German attitude toward international law had only a small merchant marine, but American public opinion was shocked at the loss of life that this new warfare would evidently cause and the United States government refused to compromise on the rights of its citizens to travel under the protection of international law.

After the sinking of the *Lusitania* (q.v.) on May 7, 1915, with the loss of 128 American lives, three notes were required to convince the German government that it had to take cognizance of American public opinion. The first indication of a tendency to yield appeared when Berlin made apologies and offers of reparations for the destruction of two United States freighters, which the Germans claimed had been sunk by mistake. On August 19, the British liner *Arabic* was sunk under conditions similar to those of the *Lusitania*, but before any action could be taken by the United States Germany requested President Woodrow Wilson to await official investigation. On September 1, the German government submitted the information that the *Arabic* had been destroyed in error after the German commander had been instructed not to sink liners without warning and without providing for the safety of the passengers. On March 24, 1916, however, the British channel steamer *Sussex* was torpedoed with the loss of several American lives. After a brief correspondence, on April 18, the United States government demanded assurances that ships would no longer be sunk without warning and without regard for the safety of persons on board, and threatened to sever diplomatic relations if such assurances were not given. Faced with an ultimatum, the German government yielded, but in its reply of May 4 included a statement that it expected the United States to induce Great Britain also to observe the rules of international law. The United States refused to admit that the rights of its citizens could be held conditionally, and there the matter rested until January 1917.

Behind these events lay a controversy within the German government. The naval administration headed by Admiral von Tirpitz held that the

Passengers and crew leave sinking French steamship *Sontay*, torpedoed in the Mediterranean on April 16, 1917.

U.S. War Dept. General Staff

more vigorously the war was prosecuted the sooner it would come to an end, and that, since the economic life of Great Britain was entirely dependent on shipping, it was the duty of the German Navy to strike her in this area. Chancellor Theobald von Bethmann-Hollweg held that it was his duty to make diplomacy succeed, and this view, which had the support of the emperor, prevailed for a time. On March 16, 1916, Tirpitz resigned. Admiral Scheer refused to use submarines against merchantmen in the approaches to Great Britain under the restricted conditions required by international law and withdrew them for use against military targets. In the Mediterranean and in the White Sea off Arkhangelsk the submarine war against shipping continued with considerable success under the restricted conditions.

The submarine policy of the navy was approved by the German people, who wanted to strike at Britain in any way possible. By the end of 1916 it was evident that Germany was not winning the war. After a German offer of peace negotiations had been rejected by the Allies, the naval party received the powerful support of Field Marshal Paul von Hindenburg and Gen. Erich F. W. Ludendorff. The chancellor acquiesced, and on Jan. 31, 1917, the German government announced the resumption of unrestricted warfare after February 1. The United States was left with no choice but to break off diplomatic relations on February 3, and, after several attacks on American ships, to declare war on Germany on April 6, 1917.

The German decision to adopt unrestricted submarine warfare was made on the assumptions that (1) six months of such a campaign would force the British to sue for peace; (2) the United States would probably not become a serious military factor within this time; and (3), if it did, German submarines would prevent American troops from reaching France. None of these assumptions proved valid, but the British people did not know how close they came to defeat until after the war. In the spring of 1917 one ship in four that left Britain did not return, and Admiral Jellicoe, then first sea lord, admitted that the war could be lost by November.

Britain was saved by the convoy system and by German overconfidence. The adoption of a policy of convoying ships rather than patrolling areas had been advocated for some time by a group of younger officers in the Royal Navy, but they could not overcome the opposition of their seniors until they obtained the sponsorship of Rear Adm. William S. Sims, commander of the United States forces in European waters. The Germans put their faith in an all-out effort that would produce very heavy losses in shipping in a few months rather than in a sustained effort over a longer period. All available submarines were sent to sea, maintenance was curtailed, and submarine building was cut back. By the autumn of 1917, however, this gamble had been lost, and resumption of building in 1918 was too late to affect the issue.

Meanwhile, for every submarine unit the Germans put into the attack, the Allies had to muster 20 units to counter it. Reports of submarine losses indicate that 39 percent were destroyed by patrols, 30 percent by mines, and 8 percent by submarines, with aircraft a poor fourth. Casualties in the German submarine service ran as high as 50 percent. Nevertheless,

U.S. Signal Corps

American troops wave farewells as transport ship prepares to leave the United States for France.

submarine crews played no part in the mutinies within the fleet that in large measure brought on the surrender of Germany. They remained loyal to the end.

Proper allocation of shipping was almost as important to the salvation of Great Britain as the convoy system, the antisubmarine weapons, and German overconfidence. In addition to the losses by submarines, a large amount of British shipping had to be withdrawn from trade for military uses. Building programs in the early days of the war were devoted primarily to naval vessels, and until 1918 merchant shipbuilding was never able to compensate for the losses. In the beginning of the war it was impossible to obtain any form of allocation of shipping, and different interests often bid against each other. By 1917, however, most commodities were under government control, and it was possible to set up an agency for the control of shipping with representatives from such users as the War Office, Board of Trade, Ministry of Munitions, and Ministry of Food. War risk insurance was provided to induce neutral merchant vessels to continue trading with the Allies. By 1917 all maritime countries except the Netherlands allowed their ships to be used, and the Dutch ships were taken over by right of angary. German ships interned in American ports were put into the shipping pool after the United States became a belligerent.

The American role in the war at sea was not dramatic. Naval units served as parts of British naval task forces. American destroyers operated out of Queenstown (now Cobh), Ireland, and patrol craft of other types operated elsewhere. United States transports carried a large proportion of American troops to Europe but, despite the demands on Allied shipping, not the major portion. A division of battleships reinforced the Grand Fleet, and another was stationed in Bantry Bay, Ireland, to cover the disembarkation ports of Brest and St. Nazaire.

In summary, Germany's unrestricted submarine warfare, while threatening the Allies with defeat, brought the United States in on their

side. The defeat of the U-boat by the convoy system made possible the transportation of 2 million American soldiers to France, or enough to offset the collapse of the Russian Army and to assure Allied victory.

Rear Admiral, United States Navy (Retired).

14. The War in the Air

The principal national contenders in the air fighting of World War I were Germany, France, and the British Empire; Italy, Austria-Hungary, the United States, and Russia played minor though not inconsequential roles. Of these powers, Germany was the best prepared for the new warfare in the skies, as she was for the traditional battles on the ground. The Germans had prepared methodically and diligently for every foreseeable aspect of war, while Britain slept, and French generals preached that victory was to be achieved by determination and bayonets. Moreover, Germany was a highly industrialized nation, possessing the seed corn needed for air armadas: aircraft factories, skilled artisans, and better aircraft and engine designs than those of her rivals.

France stood next in capacity for air warfare. Her people had shown tremendous interest in the first European flights of the Wright brothers near Paris, had reacted enthusiastically to the exploits of the Brazilian Alberto Santos-Dumont, and had taken great pride in their own air pioneers, such as Louis Blériot and Henri Farman. Moreover, France was not far behind Germany in number of aircraft and in size and number of aircraft factories.

Great Britain had had fewer outstanding early pilots and engine builders. Her air industry was so underdeveloped that her first five air squadrons sent to France in August 1914 (all she had at

the time) were equipped largely with ^{planes} and engines of French design. At the same time, she was a highly industrialized nation with large numbers of skilled workers.

The Austrian and Italian air forces were of less importance (note that Italy did not become a belligerent until May 1915), though the Italians were the first to employ airplanes in warfare, having used them to drop a few crude bombs on Arab tribesmen during their conquest of Libya in 1912. The Russians had experimented with unusually big airplanes but without much success, and their small air force consisted largely of French planes.

Although it had been two American citizens, Wilbur and Orville Wright, who had made the first successful heavier-than-air (airplane) flight, the United States remained surprisingly apathetic toward aviation in general and the 1914-1916 air operations in Europe in particular. Even the glaring deficiencies shown by the 1st Aero Squadron, which (equipped with 16 training planes) had accompanied Brig. Gen. (later General of the Armies) John J. Pershing's expeditionary force into Mexico in 1916, failed to rouse either military or industrial leaders to corrective action. Consequently, when the United States finally declared war on Germany in April 1917, it did not have a single combat airplane. American aviators had to be trained in French and British schools and fly French and British aircraft.

While the major air operations of World War I took place over the battlefields of France, military aviation also played a valuable part in the operations in northern Italy. The Germans used aircraft effectively in their defeats of the Russians along the eastern front, and the employment of airpower by Gen. Sir Edmund Allenby (later 1st Viscount Allenby) against the Turks in Palestine remains a classic example of the proper use of aircraft in mobile warfare.

The air phase of World War I can be best understood by a consideration of the basic elements of air fighting: men, machines, organization, and tactics.

The Men.—Man has always been the prime element in war; he initiates it, directs it, fights its battles, and designs and builds its weapons. In any military operation the leader is likewise all important, but World War I found its fledgling air forces practically leaderless. Military aviation was less than 10 years old. Military history and doctrine were replete with examples of great generals and famous admirals, but in all the annals of warfare there was not a single page on the planning and conduct of air operations. Officers and men were as little tested as their equipment. Leadership had to be established by competence and survival in action.

From the first this challenge attracted men of daring and energy from other branches of the armed forces and from civil life. The aviators of the opposing armies were volunteers, picked for physical fitness and eager to match themselves against the risks of this new sort of war. They rode frail, underpowered craft into a strangely different field of battle, where the impersonal forces of wind, weather, and lack of oxygen could be more deadly than the human enemy. There were no trenches for protection but only a chance cloud or the sun's glare for momentary concealment—no safe place to hide—in the empty reaches of the sky. The aviator often fought

and died alone. Even his training was full of hazards: more fliers lost their lives in training than in combat. Typical of the breed of fighting men that air warfare attracted was the Lafayette Escadrille, composed of American adventurers and idealists who volunteered for service with the French early in the war and established an excellent combat record.

The air force commanders who came up through this stern testing were mostly young, enthusiastic, and aggressive. The outstanding personality among them undoubtedly was Maj. Gen. (later Air Chief Marshal) Sir Hugh Trenchard of Great Britain, now generally recognized as the founding father of modern airpower. A commander of intelligence, vision, and method, able in presenting his views, he built the Royal Air Force into the most efficient air service in Europe. Brig. Gen. Maurice Duval of France, the expert Lt. Gen. Ernst von Hoeppner of Germany, and Col. (later Maj. Gen.) Giulio Douhet of Italy all achieved distinction as skilled air force commanders and prophets of the coming greatness of air power. Brig. Gen. William Mitchell showed considerable talent in directing the operations of the American air units in France; a convinced disciple of Trenchard, he later devoted his life to championing the airplane as the decisive weapon of future wars.

Initially, air fighting was a thoroughly individualistic affair. Fliers kept scores of their kills, those in the Allied air forces with five or more to their credit being termed "aces." Some became legendary figures—William Avery Bishop, the Canadian; Georges Marie Guynemer, the French ace who scorned maneuvering, always attacking with headlong fury; Manfred von Richthofen, the "Red Knight" of Germany; Albert Ball, the deadly Englishman; the Americans Raoul G. V. Lufbery and Edward V. Rickenbacker—and Edward Mannock, Oswald Boelcke, Max Immelmann, René Fonck, Frank Luke, Jr., and many others.

Less publicized and therefore seldom known to fame were the pilots and observers who performed the humdrum but vital tasks of adjusting artillery fire, photographing enemy positions, and scouting far behind enemy lines, their slow lumbering planes often easy victims for enemy fighter pilots. The bomber crews, harried by enemy fighters and antiaircraft guns by day and risking weather and navigational errors (their instruments being few and crude) by night, also served largely unnoticed. Possibly the most risky of the airman's missions was that of the crews of the observation balloons, hung defenseless between earth and sky as they watched for telltale enemy activity and directed artillery fire.

Through all this dangerous duty, above the bloody grapplings in the mud below, ran a thin gleam of the chivalry of older wars. An opponent whose guns had jammed in an aerial dogfight might be (if rarely) spared. Messages might be dropped over an enemy airdrome, telling of the fate of a pilot missing from it. The average aviator might occasionally be charged with indiscipline, but he normally was nevertheless a ready, self-reliant fighting man.

The Machines.—Most of the World War I air operations were carried out by heavier-than-air machines (airplanes). All armies made extensive use of lighter-than-air observation balloons, however, and most of them had experimented with various types of dirigibles. The Germans had

done the most outstanding work in this last-named field and had developed a fleet of large, rigid-type dirigibles (the famous zeppelins). Excellent weight lifters capable of cruising long distances (one of them made a successful 96-hour, 4,225-mile, nonstop flight between Bulgaria and northeastern Africa in November 1917), these impressive aircraft initially scored considerable success. Their size and relatively slow speed made them increasingly vulnerable to the Allies' constantly improving fighter airplanes and antiaircraft artillery, however, and they lacked the structural strength to withstand severe storms. These weaknesses resulted in their being gradually driven from the skies.

The typical military airplane at the beginning of World War I was unarmed, slow, fragile, and mechanically unreliable—hardly beyond the experimental stage and capable of carrying only enough fuel for a short flight. Exact figures are not available, but it is probable that all the original belligerents together could put less than 2,000 serviceable machines into action. In addition, most of the so-called aircraft factories operating in 1914 (Germany was credited with about 12, France with 8, and Britain with 6) were merely small shops, employing a few hundred skilled artisans. Airplanes were built largely by hand on a cut-and-try basis. There was nothing comparable to the tremendous shipbuilding and armament industrial complexes which provided weapons for the sea and land forces of the period. Aircraft engines were inefficient and heavy for the power they delivered, averaging six to eight pounds of weight per horsepower.

From this primitive stage the brutal necessities of war and the increasing appreciation of the potential importance of air operations soon led to dramatic improvements in airplane design and production. The nondescript general-purpose plane of 1914 began to evolve into several new types designed for specific functions. Swift fighter planes, generally single-seaters (though some of the most effective British fighters were two-seated models), were employed to hunt down other aircraft. These fighter aircraft—such as the French Nieuport and Spad, the British Camel, and the German Fokker—shared the fame of the aces who flew them and are probably the best-remembered aircraft of the war. The two-seater observation planes were slower but usually had a longer range; by 1918, German observation planes could operate at higher altitudes than could most Allied fighters. Frequently they carried special cameras for aerial photography of enemy positions or primitive radio equipment for the direction of artillery fire.

The resulting race for air supremacy over the western front produced series of improved planes on both sides. Speeds became greater, ceilings (the maximum height at which the plane could operate) were pushed upward, and the rate of climb increased. Air battles demonstrated that airplane quality and performance were even more important than total numbers. Air superiority shifted back and forth between the two sides as new types of aircraft were introduced and tactics developed to exploit their particular capabilities. In 1916, for example, the British ruled the skies over the Somme battlefield; nine months later, in the spring of 1917, Hoeppner had wrested it from them. On the whole, the planes of both sides were fairly evenly matched,

neither being able to maintain any distinct superiority in plane and engine construction, though the Germans might be credited with slightly greater technological aptitude.

In 1915 the machine gun became the standard weapon for airplanes, though the problem of how to mount these weapons so as to obtain the most effective use of their firepower took considerable time to solve. Some fighter aircraft carried a light machine gun (such as the British Lewis gun) mounted in the center of their top wing in order to give fire forward above the propeller. A French flier obtained greater accuracy by mounting a machine gun just in front of his cockpit, so that it could fire directly through the rotating blades of his plane's propeller. This enabled him to aim his gun simply by pointing his plane at his opponent; light armor on the inner surface of the propeller gave that vital part rough-and-ready protection from such bullets as struck it. German technical skill made this concept obsolete by developing a system of mechanical linkages which synchronized the revolutions of the propeller and the rate of fire of the machine gun. This system was soon copied by the Allies and became standard equipment on fighter planes, though some still retained the machine gun on the top wing. Observation planes and two-seater fighters were variously armed; usually the pilot had one or two fixed guns mounted like those on the fighter aircraft, and his passenger had one or more movable guns. Since increasing attention was being given to all-around protection, one of these might be mounted so as to fire through the floor of the rear cockpit. A few special fighters carried heavy machine guns or even light cannon; airplane armor made its first tentative appearance.

By 1917 the aircraft industry began to develop the skills necessary to turn out larger aircraft designed primarily for bombing. Previously, some observation planes had been modified so as to carry light bombs slung under their wings. Smaller bombs had been carried in the cockpit and dropped hopefully overside by hand; the French had tried but abandoned the idea of scattering showers of steel darts called *fléchettes*. Some of the new bombers, such as the British DH series, were still modified observation craft. Others were big, slow biplanes like the British Handley Page bomber, the Italian Caproni, and the German Gotha. The Handley Page, which came too late to take a serious part in the air war, was capable of carrying sixteen 112-pound bombs and fuel for an eight-hour flight. These bombers, in turn, were subdivided into day and night bombing planes; generally speaking, the former were lighter and faster, the latter slow but capable of carrying a much greater bomb load.

Naturally, this increase in airplane numbers, types, and capabilities could be brought about only through an unparalleled development of the aircraft industry. That of France and Britain grew steadily, and the French effort especially (though plagued by a multiplicity of plane and engine types) was so well directed that France was able both to supply her own needs and to furnish large numbers of excellent aircraft to her allies. Germany, thanks to an early start and a broad industrial base, could outproduce either France or Britain until early in 1918. Thereafter, diminishing raw materials and heavy demands for munitions for the German Army prevented

her efficient aircraft industry from keeping pace with her losses in combat.

The United States aircraft industry was of necessity hastily built from the ground up after the American entry into the war. By agreement with its allies, the United States furnished their aircraft industries with needed raw materials (sprucewood, linen, chemicals, fuels, and lubricants); in exchange, Britain and France trained American fliers and mechanics, and France provided planes for the first United States air squadrons. Since fighter aircraft were evolving so rapidly that any selected type would be obsolescent before it could be put into production in the United States, it was further agreed that the United States would produce the DH-4 (a sturdy, British-designed plane used as an observation plane and as a light bomber) for all of the Allies, and would in addition develop and produce a new type of engine (dubbed the Liberty engine) in ample quantity to satisfy its own DH-4 production and French and British requirements. American production got under way too late to be of importance, but it could have been a considerable factor had the war continued into 1919.

By the war's end approximately 8,000 Allied planes were arrayed against 3,300 enemy aircraft. Back of the men who flew these aircraft were the much larger forces of mechanics, armorers, and supply personnel in the service parks and repair depots behind the lines. The importance of their work can be understood when it is realized that an airplane of this period lasted only a few weeks in combat. Thereafter, even if not destroyed, it normally required extensive repairs. A significant figure is available to illustrate this fact: the British had 1,300 planes operating in support of their armies at the beginning of the Second Battle of the Somme. When the fighting ended a few weeks later, 1,100 of the original 1,300 planes had been destroyed or damaged and had to be replaced.

It should be noted that though the major emphasis in World War I was on air operations in support of the armies, the contending navies steadily developed their own air elements for overwater scouting, fire direction, and bombing attacks on submarines and surface ships. Originally, the aircraft used were seaplanes, which operated from established naval bases. Later, battleships and cruisers began to carry one or more light planes, and fast merchant vessels were converted into seaplane carriers which could accompany the fleets on extended operations. Since seaplanes lacked the speed and maneuverability of land-based planes, the British eventually developed the first modern aircraft carrier (commissioned into the Royal Navy in October 1918), capable of both launching and recovering the latter type. Probably naval aviation's most valuable mission during the war was its antisubmarine work, a task for which dirigibles proved very satisfactory.

Organization.—In 1914 the airplane was still a new and unproved auxiliary to the armies and fleets. Its intended missions were observation, reconnaissance, and courier duty—functions generally viewed as extensions of the conventional military signal communications systems for lack of a more definite classification to assign them. Consequently, the Germans grouped their air service with railway troops and signal units; a communications troops, and the French Army

and Navy administered their respective aviation elements as subdivisions of their communications services. In the United States military aviation was a responsibility of the Signal Corps from 1907 to 1918, when the Air Service was organized. (In June 1917, General Pershing had already detached the aviation units serving in France from the Signal Corps, reorganizing them as the Air Service, American Expeditionary Force.) Britain had followed a far different course, combining all of its aviation units into a Royal Flying Corps, but on July 1, 1914, just before the outbreak of the war, this force was broken up. The Royal Navy set up its own air force under the title of the Royal Naval Air Service, while the Royal Flying Corps became merely the air arm of the British Army, where it had equal status with the cavalry, infantry, and other combat arms.

As the war progressed and the importance of military aviation became more firmly established and more generally recognized, its management gradually moved to higher levels. Britain again led the way. By 1918, largely as a result of German air raids (first by zeppelins and later by Gotha bombers) on London, popular dissatisfaction with Britain's air defenses had led to protests in Parliament. Cooperation between the Royal Flying Corps and the Royal Navy Air Service had been limited; moreover, the two groups were struggling bitterly over the limited supplies of planes, engines, and personnel available. On the advice of a board headed by Lt. Gen. Jan Christiaan Smuts (who was strongly supported by his fellow member, Winston Churchill), a separate Air Ministry was set up in the British government in December 1917. This placed its head, the air minister, in the War Cabinet as an equal partner (as least in theory) of the secretary of state for war and the first lord of the admiralty. Furthermore, in April 1918 the Royal Flying Corps and the Royal Naval Air Service were recombined into the Royal Air Force, which was given equal status with the Royal Navy and the British Army.

Both France and Germany continued to retain their air services as organic parts of their armies and navies, but both established subcabinet posts (assistant secretaries or undersecretaries) to coordinate the administration of such matters as engine and aircraft construction, allocation of personnel, and formulation of military aviation budgets.

In the United States a series of tentative reorganizations in May 1918 had at last converted the Signal Corps' Aviation Section into the independent Air Service, but had divided the necessary authority between a director of military aeronautics and a Bureau of Aircraft Production. Within three months aircraft production was in such chaos that the post of second assistant secretary of war was created to provide an official with sufficient authority to untangle it. At the same time, this secretary functioned as director of the Air Service and so was able to deal with military aviation problems as a whole.

On the fighting fronts the organization of the various air forces was very similar. Each national commander had a senior air force officer as his adviser on all matters relating to military aviation. Thus in the American Expeditionary Force (organized according to French and British experience), General Pershing's Air Service was commanded by Maj. Gen. Mason M.

Patrick; General Patrick, in turn, had General Mitchell as his assistant for operations and Brig. Gen. Benjamin D. Foulois as an assistant for training and supply. At the next lower level of command each army commander had an aviation officer as a member of his staff. These officers coordinated air operations for their respective commanders, prescribed tactics, negotiated for flying fields, and allocated supplies and replacements.

The basic air force tactical organization was the squadron, usually composed of aircraft of one type only, and so designated as a fighter, observation, bomber, or service squadron. Fighter squadrons were equipped with approximately 18 planes, observation and bombing squadrons with 12. A fighter squadron would have from 20 to 25 aviators, and observation and bombing squadrons as many as 50, including observers and bombardiers. In addition, each squadron had 100 to 150 ground crew personnel. The service squadrons were responsible for the logistical support of the combat squadrons.

It was usual for squadrons to be assigned to the direct support and operational control of armies, where (as noted above) their operations would be coordinated by the aviation staff officers concerned. As the war progressed, the need for larger and more flexible air commands developed, and squadrons would accordingly be formed into groups, and these groups on occasion were assembled into wings. As a climax, in 1918 the French organized most of the planes which could be spared from their hard-pressed armies into an aviation division of 432 fighters and 193 day bombers, thus establishing a strong, mobile force which could be readily shifted to

any part of the western front to meet an emergency or exploit an opportunity.

Also in 1918, General Trenchard established his famous Independent Air Force (average strength, approximately 75 day bombers, 49 heavy night bombers, and 16 fighters) with the mission of bombing rail and industrial centers behind the German front. This was the first strategic air force to be established. Hindered in its avowed primary mission by bad weather and heavy losses, it still furnished a powerful air reserve. (It should be noted that this force did not utilize mass air attacks, such as became common in World War II.)

In October 1918, Trenchard was organizing an Inter-Allied Independent Air Force, made up of contingents from all of the Allied air forces, to support the projected 1919 campaign by air strikes deep into Germany. As the commander of this force, Trenchard was to operate under the direct control of Marshal Ferdinand Foch, the Allied commander in chief. The armistice of Nov. 11, 1918, scuttled his hope of leading it on raids against Berlin.

Tactics.—In the early months of World War I airplanes were commonly employed as scouts, with varying success. As they sought out the enemy's forces, they often passed enemy planes bound on similar missions. At first, pilots and observers might wave to opposing crews as they met, if not as a greeting, at least in recognition. It was soon realized, however, that these missions were important to the enemy's operations and should be opposed. Aviators began to arm themselves with odd collections of rifles, shotguns, and pistols and to make clumsy efforts to intercept and destroy enemy aircraft. Improvement of airplanes and weapons made these clashes increasingly deadly, and fighter aircraft tactics rapidly became the largest phase of air operations.

As fighter planes took an increasing toll of the slower observation planes, the latter were sent out under the escort of friendly fighters. In early 1916, however, the French discovered that their fighters could be more effectively employed on offensive patrols over the enemy's lines to search out, surprise, and shoot down the enemy fighters—and even, if possible, to attack German forward airdromes. By thus gaining local air superiority and keeping the enemy on the defensive, the French fighters enabled their observation planes to operate freely without escorts. During the Battle of the Somme that same year the British employed this technique aggressively and systematically and achieved outstanding success.

The actual tactics of these air battles were quite simple. Underpowered and fragile, the planes of the period had an inconvenient tendency to come apart if subjected to violent maneuvering. Successful pilots usually sought to gain altitude, diving "from out of the sun" on enemy aircraft passing below them and trusting to speed and surprise. Planes patrolled singly or in small groups, attacking any enemy aircraft encountered in their assigned area.

The size of the tactical units involved in these operations grew steadily, if slowly. In this, as in so many other aspects of air warfare, the methodical Germans seem to have set the example. They employed strong units of picked fighter pilots—such as Richthofen's famous, gaudily painted "Red Circus"—at critical points. By 1918 for-

mations of 50 fighters were not uncommon. A clash between two such groups could lead to a wild, scrambling dogfight—a mass of confused individual engagements in which each fighter sought to get "on the tail of" (behind) his opponent.

Initially, as previously mentioned, squadrons were assigned to armies and so were tied to their areas of operations. During the later stages commanders on both sides began to realize that the inherent mobility of aircraft permitted their concentration at the decisive point of the battle, and accordingly would assemble all available air strength to support the divisions spearheading the attack. As an example, the American St.-Mihiel offensive was supported by both the British Independent Air Force and the French Aviation Division, as well as by American, Italian, and Portuguese aircraft. Once the operation had been successfully concluded, most of these planes were shifted to other sectors of the front to support other operations.

The observation planes naturally worked more closely with the ground forces than did the fighter planes. The development of effective aerial cameras enabled army commanders to keep constantly abreast of changes in the enemy's defenses and dispositions. Eventually thousands of aerial photographs were distributed to infantry divisions to replace outdated maps. Likewise the development of radio equipment greatly improved air-ground communications and made it possible for air observers to direct artillery fire effectively. Since artillery fire was the backbone of both offensive and defensive operations during this period, the importance of this service can easily be appreciated. In this mission the airplane was effectively supplemented by the cap-

A rare shot of a dogfight on the western front between German (marked with black cross) and British airplanes.

tive observation balloon. Though unable to attain the height to which observation planes could climb or to fly over enemy-held territory, the balloon had the advantages of a fixed position (which enabled its observer to orient himself more exactly) and of direct telephonic communication with the artillery units it served. The natural vulnerability of its big bag of inflammable hydrogen gas was at least partially compensated for by emplacing it in a ring of anti-aircraft weapons.

During 1917-1918 a new aerial technique, commonly known as the attack mission, appeared. Besides gaining air superiority in the skies above the battlefield, fighter aircraft were made responsible for attacks with machine gun fire and light bombs against enemy ground forces. Attack aviation was frequently employed against the enemy trench system in support of assaults by friendly infantry. It was very effective against troops and vehicles caught in railroad yards or on the march. If the enemy were retreating through rough country where frequent defiles made it difficult for his troops to deploy off the road, the results could be devastating. In 1918, Italian and British aircraft mauled the Austro-Hungarian forces retreating after their defeat at Vittorio Veneto. French fliers pounded the retreating Bulgarians in the Balkans, and Allenby's air force broke up large elements of the Turkish troops retreating before him in Palestine. Possibly, however, the greatest success of attack aviation occurred in March 1918, when all possible Allied aviation was committed (as the only mobile reserve available) to check

victorious German columns following up the retreating British Fifth Army. Employed energetically, Allied airmen gained time for Allied ground forces to patch their broken front.

Though some military leaders had for years visualized the possible use of aircraft as bombers, World War I bombing operations were of relatively little importance. Neither satisfactory planes, bombs, navigational instruments, nor bombsights were available. The bombing planes employed were too slow and usually lacked sufficient range to reach vital enemy targets. Despite the courage of the bomber crews, neither day nor night raids met with outstanding success. The German raids against the London area did force the withdrawal of some of the best British fighter units from France for home defense, but the Germans found their losses dishearteningly heavy. Bombing operations proved most useful when directed at enemy communications close behind the front during major ground offensives.

There were occasional instances of the air supply of ground troops, both in dropping food and ammunition to cutoff units and in the use of zeppelins or heavy bombers to move supplies to hard-to-reach areas of Africa or Asia Minor.

In general, both sides learned that air superiority was hard to win and was seldom complete. In 1917 and 1918, by securing strong air support, Allenby was able to destroy the Turkish-German air units opposing him in Palestine and so to blind the Turkish ground forces. This enemy aviation was weak numerically and qualitatively, however, and was isolated beyond the hope of effective reinforcement. In contrast, on the western front the Germans remained able even in 1918 to secure local air superiority by hurriedly concentrating their remaining picked fighter units.

In the air, as on the ground, retention of the initiative proved decisive. Though ground commanders might protest, it was repeatedly proved that better results could be obtained by concentrating friendly aircraft for offensive action against enemy aircraft and airbases than by parceling them out for the defense of assigned sectors of the front.

Significance of Air Warfare.—A new dimension had come to warfare; as Napoleon had predicted, "He who holds the high ground will win." The true lessons of World War I air warfare, however, were blurred by the fact that the aircraft employed, despite amazing improvement during the four years of combat, never achieved the desired level of technological development. Like the tank, they remained short-ranged, relatively slow, and mechanically unreliable weapons, seldom capable of independent action, and therefore only auxiliaries (if important ones) of the infantryman and the gunner. Only a few military leaders had the vision to see the future possibilities of either of these emerging weapons, although 21 years later, the air-armor team swept across Europe, and air superiority became the key to victory.

World War I trained the air force commanders of World War II: Hermann Goering, Sir Charles Portal, Arthur Travers Harris, Henry H. Arnold, Carl Spaatz, and many others. It taught hard lessons for those willing to learn: the need for a strong industrial base, ready for quick conversion from peacetime manufacturing to the production of air armaments; the importance of keeping planes and engine types to a

minimum, both to speed up aircraft production and to simplify problems of maintenance and supply; and the value of vision and imaginative leadership. Above all it demonstrated that, in Trenchard's words, "the airplane is an offensive weapon."

15. Diplomatic History of the War

NEGOTIATIONS DURING THE WAR

At the outbreak of war in 1914 the German and Austro-Hungarian empires were united by an alliance that dated back to 1879. Though each of the two governments declared war separately on the common enemies and neither invoked the formal alliance, both emperors declared that the two states would fight together to the end, neither making peace without the other.

Of the nations on the opposing side, only two, France and Russia, were formally allied. The British government had understandings with both, but was not committed to join them in war, and in fact the London cabinet debated for several days before deciding on its course. Then, on August 4, Britain declared war against Germany not because France and Russia had done so, but because Germany had invaded Belgium, and Belgian neutrality was guaranteed by an 1839 treaty of which Britain was one of the signatories. On Sept. 5, 1914, however, the British, French, and Russian governments signed the Pact of London (see LONDON, PACT OF), pledging themselves to make no separate peace. The three powers which before the war had formed the Triple Entente (q.v.) thus became allies. In addition, each entered into comparable engagements with other states fighting the Central Powers: Serbia, which had been the first belligerent; Montenegro, which was Serbia's ally; Luxembourg, which the Germans invaded on Aug. 2, 1914; and Belgium. Portugal affirmed her long-standing alliance with Britain, even though the Central Powers did not formally declare war on her until 1916. All these states together were known as the Allies.

Japanese Intervention.—Within a month after the declarations of war in Europe, Japan joined the Allies. Though the British government advised Tokyo that it did not interpret the Anglo-Japanese alliance (q.v.) of 1902 as requiring Japan to enter the European war, hostilities at sea were soon extended to the Pacific, and the British Dominion governments in Australia and New Zealand made it clear that they meant to seize Germany's possessions there. The Japanese government volunteered to enter the war. The British Foreign Office then suggested that the Japanese might confine their operations to the Pacific and not attack the German leasehold of Kiaochow in China, but Japan was not receptive to this proposal. On August 15, it dispatched an ultimatum to Berlin, demanding the withdrawal of German naval craft from Japanese and Chinese waters and the unconditional surrender of the leasehold, "with a view to eventual restoration of the same to China." The seven-day time limit expired without Germany's replying; on August 23, the Japanese government

formally declared war; and in October it announced its adherence to the Pact of London, thus becoming one of the great Allies and pledging itself to negotiate no separate peace.

Turkish Intervention.—The adherence of Japan to the Allies was soon offset by Turkey's intervention on the side of the Central Powers. Though Britain had traditionally been a supporter of the Ottoman Empire, and British and French firms had large investments in Turkey, German influence had been rising steadily. The Young Turks who had seized power in 1908 regarded the existence of British and French spheres of influence in the Levant as inimical to their pan-Turkish aspirations; they also considered Russia their chief enemy in the east, the Black Sea, and the Balkans. Their leaders, War Minister Enver Pasha, Interior Minister Mehmet Talaat Pasha, and Navy Minister Ahmed Djemal Pasha, were admirers of Germany, and in 1913 the Turkish government had agreed to have its army reorganized by a German general, Otto Liman von Sanders. In July 1914, Enver went to Berlin and there negotiated a secret treaty of alliance (signed August 2), by the terms of which Turkey was to become a belligerent, receiving in compensation portions of conquered Russian territory and, if Greece and Bulgaria entered the war on the opposing side, parts of their lands as well. Turkey was to remain neutral, however, until she had had an opportunity to ready her defenses.

After the outbreak of hostilities the Allies made some effort to induce Turkey to perpetuate her neutrality. The British government commandeered two warships that were being built in England for the Turkish government, but at the same time allowed two German warships, the *Goeben* and the *Breslau*, to slip through the Dardanelles and be transferred by Germany to the Turkish government. The British prime minister, Herbert Henry Asquith, remarked privately that international law would require the Turks to man the vessels with their own men, and "Turkish sailors cannot navigate . . . except on to rocks or mines." Meanwhile, British, French, and Russian diplomats suggested to the Ottoman government that agreements might be worked out under which Turkey would receive concessions in return for her neutrality.

But the Young Turks soon dispelled any doubts about their ultimate intentions. They retained German crewmen on the *Goeben* and *Breslau*, merely putting them into Turkish uniforms. When the Allied governments protested, the Porte ordered all British seamen dismissed from the Turkish Navy and appointed a German as commander in chief of the Turkish Fleet. At the instigation of Enver the Turkish press opened a violent campaign against the Allies and in favor of the Central Powers. On Oct. 29, 1914, a Turkish fleet bombarded the Russian coastal cities of Odessa, Sevastopol, Feodosiya, and Novorossisk. The Allied governments demanded that the Turks make reparations and dismiss all Germans from their forces. After the Turks had refused to do so, the major Allies recognized a state of war (Russia on November 1, and Britain and France on November 5), and Turkey became a cobelligerent with Germany and Austria-Hungary.

Italy's Entry into the War.—The great prize among European neutrals was Italy. With Ger-

many and Austria-Hungary, it had been a partner in the Triple Alliance (q.v.), but for some time it had been drifting away from this tie. When the war opened and the German and Austrian governments asked Italy to join them, the Italian cabinet refused on the technical ground that Article 7 of the alliance treaty required consultation and agreement concerning any territorial change in the Balkan area, and that Vienna had not consulted Rome before making demands on Serbia. On August 3, the Italian government issued a proclamation of neutrality. From the outset, however, it was evident that Italy would probably at some point abandon this status and join either the Central Powers or the Allies. Conservative and colonialist groups in the country favored the former, reasoning that an Allied victory would strengthen liberalism in Italy, give Britain total control of the Mediterranean Sea and thus check future growth of the nation's African empire, and place Russia in such a commanding position in the southern Balkans as to halt Italian expansion there. Liberal, commercial, and nationalist groups leaned toward the Allies, fearing that conflict with Britain would strangle Italian trade, and believing that Italy's wisest policy was to seek the annexation of Austro-Hungarian territories populated by Italians.

The prime minister, Antonio Salandra, was of the latter view. As early as Sept. 30, 1914, he reported to King Victor Emmanuel III that Italy's only real choices were to remain neutral or to join the Allies, and that war against Germany and Austria-Hungary would be the most profitable course, but that hostilities should not be opened until spring, when the army would have had time to prepare for an offensive. Salandra did not, however, have the full support of the Italian people or even of a majority of the Chamber of Deputies. Three fourths of the deputies were supporters of his predecessor, Giovanni Giolitti, who for obscure reasons had resigned his office in March, and Giolitti was not committed to the Allied cause. In public, therefore, Salandra confined himself to declaring on October 18 that the government would be "uninfluenced by any sentiment but that of an exclusive, unlimited devotion to our country, a sacred egoism [*sacro egoismo*] for Italy," and on December 3 that it would maintain "an alert and armed neutrality." For his part, Giolitti adopted a quasi-neutralist position, asserting in January 1915 that "much [*parecchio*] may be obtained without going to war." These rival slogans, "*sacro egoismo*" and "*parecchio*," ornamented Italian partisan debate throughout the winter of 1914-1915.

The Allies and the Central Powers assumed that Italian favors were up for auction. The German General Staff, already alarmed by Austria's inability to make headway against the Russians on the Carpathian front, feared that Italian intervention would be followed by intervention on the part of Rumania, Bulgaria, and Greece, and that, at the very least, this would require a substantial diversion of German troops from the French and Russian theaters. German military and civilian authorities consequently bent every effort to persuade the Austrians to offer concessions to Italy. They encountered strong resistance in Vienna. When Austrian Foreign Minister Count Leopold von Berchtold agreed to contemplate such a policy, he was ousted by intransi-

sigents in the imperial government and replaced in January 1915 by one of their own number, Count Stefan Burián von Rajecz. But even Burián was compelled eventually to yield ground. The German government dispatched former Chancellor Prince Bernhard von Bülow as a special ambassador to Rome, and he was presently authorized to offer the Italians territory from the Austrian borderlands as well as promises of economic concessions and future grants from the British and French empires. He also encouraged neutralist journalists and entered into secret conversations with Giolitti. Another special German envoy, Roman Catholic Center Party leaders Matthias Erzberger, meanwhile appealed to Pope Benedict XV and to Italian Roman Catholics to help keep Italy out of the war.

The Allies were no less active. They subsidized journalists who advocated intervention on their side; one was the editor of the Socialist *Avanti*, Benito Mussolini. Their diplomats warned the Italian government that the Central Powers were not to be trusted and hinted that intervention on the Allied side would bring Italy large pieces of Austrian territory and a dominant position in the Adriatic Sea. The British and French were compelled at first to be vague in their promises, for the Russian government backed Serbia's ambition for a great Yugoslavia and insisted that Serbia had first claim on the Allies. Planning for their attack on the Dardanelles early in 1915, however, the British became more and more convinced that Italian intervention was urgent; they threatened the Russians with possible curtailment of financial and other aid. Czar Nicholas II's ministers gave in. As a result, the three Allies were able to sign with Italy on April 26, 1915, the secret Treaty of London (see LONDON, TREATY OF [1915]). By its terms, Italy was to enter the war on the Allied side and be rewarded subsequently with the Trentino; the Tirol to the Brenner Pass; Trieste; Görz (Gorizia); Gradisca; the Istrian Peninsula and adjoining islands; Dalmatia; such ports on the Adriatic coast as were not already assigned to Montenegro or Serbia; control over the foreign relations of Albania; recognized sovereignty over the Dodecanese, which Italy had occupied since 1912; the province of Antalya (Adalia) in Turkey, when and if Turkey were partitioned; and shares in the indemnity imposed on the Central Powers and in any African colonial spoils.

Salandra had decided in February to negotiate such a treaty. Nevertheless, he had continued through March and April to discuss possible terms with the Central Powers, constantly increasing his demands as the Germans and Austrians appeared to yield. Then, on May 3, 1915, he showed his hand. He formally denounced the Triple Alliance and notified Berlin and Vienna that Italy was regaining her freedom of action. On May 13, having failed to obtain unanimous support from his cabinet for intervention, he resigned. Giolitti refused to take power, however, and chauvinists led by the poet Gabriele d'Annunzio clamored for war. On May 16, the king advised Salandra that he could not accept the resignation; Salandra resumed office; and on May 23, the Italian government formally declared war on Austria-Hungary. Subsequently, on November 30, it proclaimed its adherence to the Pact of London. Italy had joined Britain,

France, Russia, and Japan as one of the great Allies.

Bulgaria.—On the very day of Italy's declaration of war, the Central Powers made a formal bid for Bulgaria's friendly neutrality. Though reduced in territory as a result of the Balkan Wars (q.v.) of 1912–1913, that nation still commanded the principal communication lines between Austria-Hungary and Turkey; its intervention on the Allied side would require Austria to divert substantial resources from the Russian front and the Italian frontier and would make it much more difficult for Turkey to resist the British in the Dardanelles. Consequently, the Central Powers dangled before the Bulgarian government the promise of a heavy loan, the prompt cession of Serbian Macedonia, and the transfer to Bulgaria of the lands she had lost to Greece and Rumania if those states should intervene on the Allied side.

The Bulgarian government already leaned toward the Central Powers. The Bulgarian king, Ferdinand I, was a German prince who had favored joining Germany and Austria-Hungary from the outset of the war. The premier, Vasil Radoslavov, had merely insisted on waiting until a favorable opportunity presented itself. With the offer of the Central Powers in hand, Radoslavov became less cautious. On May 29, he received a counterproposal from the Allies, offering Bulgaria part of Serbian Macedonia, Thrace to the Enez-Midye line, and Kavalla, and promising in addition to "regulate" the long-standing Bulgarian-Rumanian conflict over Dobruja. Attractive though these terms might have been, they were all contingent on the agreement of Serbia, Greece, and Rumania and on the ability of the Allies to compensate those states elsewhere. Ferdinand and Radoslavov realized that the Central Powers, if victorious, would be in a better position to reward Bulgaria, and they continued negotiations with Berlin, Vienna, and Constantinople. In July, they secured from Turkey a concession forced in their behalf by the Germans and Austrians. Turkey ceded to Bulgaria, in a treaty ratified on September 22, the land west of the Maritsa and both banks of that river, except for the city of Edirne (Adrianople). Meanwhile, on September 6, the Bulgarian government agreed to a secret alliance with Germany and Austria-Hungary. By its terms, Bulgaria was to join in operations against Serbia and was in compensation to receive after the war all of Serbian Macedonia and most of northeastern Serbia as far as the Morava River; if Greece and Rumania entered the war, Bulgaria was also to receive the lands lost earlier to them.

As German and Austrian forces mobilized for a southward offensive, the Serbs yielded to urgent pressure from the British and French and offered Bulgaria immediate concessions in Macedonia, but the Bulgarian government was not deterred from its course. In October 1915, when the forces of the Central Powers struck the Serbian lines, Bulgarian troops joined them. Bulgaria declared war on Serbia on October 14, and within a few days Serbia and the other Allies declared war on her.

Rumania.—At the time of Italy's intervention in the war, Rumania had almost thrown in her lot with the Allies. The pro-German king, Carol I, a cousin of the German emperor, had died in October 1914, and had been replaced by his ineffectual nephew, Ferdinand I. A number of

leading Rumanian statesmen, including most of the Liberal Party leaders and Take Ionescu and Nicholas Filipescu of the Conservative Party, advocated joining the Allies, but the premier, Ion Brătianu, insisted on opportunistic caution and succeeded in resisting demands that Rumania act in concert with Italy. Throughout the first two years of the war, Brătianu held his ground. Ever more tempting blandishments were laid before him by the representatives of the Central Powers and the Allies, but not until the summer of 1916 did he weaken. By that time the Allies were offering to double the territory of prewar Rumania by ceding to her Bucovina, Transylvania, the Banat of Temesvár, Maramureș, and Crișana. Moreover, the Austrians had denuded the Hungarian frontier in order to mount an offensive against Italy, and this constituted an open invitation, as an Austrian statesman later wrote, for "a Rumanian military promenade." Brătianu gave in and on Aug. 17, 1916, signed with the Allies the Treaty of Bucharest, under which Rumania was to receive all that they had previously offered in return for a prompt attack on Austria-Hungary. Despite a divided vote in his cabinet, Brătianu kept this pledge, and, on August 27, declared war.

Greece.—The Greek government also came close to joining the Allies in 1915, not because of the Italian intervention but because of the Turkish concessions to Bulgaria. The most popular public figure in the country, Eleutherios Venizelos, had been in favor of Greece's entering the war in 1914, but the king, Constantine I, and the royalist party had insisted successfully on a policy of neutrality. With evidence that Bulgaria was about to enter the war, however, Venizelos renewed his appeals, arguing that Greece should fulfill her 1913 treaty with Serbia, by the terms of which she was to send 150,000 troops to Serbia's aid if that nation were attacked by Bulgaria. In August 1915, the king reluctantly recalled Venizelos to the premiership and even more reluctantly accepted Venizelos' decision that, since Greece did not have the requisite 150,000 men, the Greek government should invite the Allies to send such a force through Greece to the aid of Serbia. The premier issued the invitation, and in October an Allied force landed at Salonika. When Venizelos stirred the National Assembly to a vote in favor of war with Bulgaria and Turkey, however, the king balked. He forced Venizelos to resign on October 5, and brought in first Alexandros Zaimes and then Stephanos Skouloules as premiers who would preserve Greek neutrality.

Both the Central Powers and the Allies exerted continual and mounting pressure on the Greek government. Bulgaria seized a fortress on the Greek frontier. The French commander at Salonika, Gen. Maurice P. E. Sarrail, fomented anti-royalist agitation; and the French government eventually made a formal demand that the king hold new elections, presumably so that Venizelos' popularity could be proved. Then, after Rumania joined the Allies, Venizelos proclaimed an open revolt, set up a provisional government at Salonika, and on Nov. 25, 1916, issued a declaration of war against Germany and Bulgaria. Aided by French and British funds and naval support, he succeeded in establishing his sway over roughly half the country. In June 1917, Constantine agreed to abdicate and allow his young son, Alexander, to become king and Venizelos to resume office as premier. Venizelos immediately sent

Greek troops into battle alongside the Allies, and the governments of the Central Powers soon formally recognized a state of war with Greece.

Plans for Partition of the Ottoman Empire.—**Constantinople Agreement.**—During all this time the major Allies had been negotiating among themselves about the postwar distribution of the Ottoman dominions. The so-called Eastern question (q.v.) had occupied much of the attention of European diplomats for most of a century and a half, and contrivance had been piled on contrivance to keep the sultanate more or less intact. With Turkey's entry into the war on the German and Austrian side, however, statesmen in the Allied capitals concluded that the demolition of that empire was inevitable. The Russian government had traditionally sought free egress for Russian shipping from the Black Sea, and early in 1915 the czarist foreign minister, Sergei Sazonov, asked the British and French to agree in principle that after the war Russia should have control over the Turkish straits. Though British governments in the past had held to the conviction that Russia should be barred from the eastern Mediterranean, the London cabinet quickly agreed that this position would not be tenable after the war. Foreign Secretary Sir Edward Grey issued cautious statements to prepare public opinion for a reversal of the policy; then on March 12, 1915, he signed a secret convention with the Russian ambassador in London, according Russia the right to control Constantinople and the Turkish straits after the war, provided that "the aspirations of Great Britain and France in the Ottoman Empire as well as in other regions are realized." On April 12, the French foreign minister, Théophile Delcassé, signed a similar convention with the Russian ambassador in Paris. As we have seen, the secret Treaty of London, concluded in the same month, provided that Italy should have Antalya if the Ottoman dominions were divided among the Allies.

Egypt.—For the British and French, the chief problem was to draw up arrangements for the areas south of Turkey proper that were nominally under Ottoman control—the Levant, Mesopotamia, and the Arabian Peninsula. After Turkey's entry into the war, the Allies had been alarmed over the possibility of the sultan's arousing the Muslim world in a crusade against Christians. In part to prepare for such a contingency, in part to counter an expected Turkish offensive against the Suez Canal, the British government decided in November 1914 to end the fiction that their high commissioner in Cairo was merely an adviser to the Egyptian government, to proclaim a protectorate over Egypt, and to proceed to formal annexation of that land. Getting wind of this plan, the French protested that they should be entitled to do likewise in Morocco, but that Muslim unrest in that area made it impossible to do so, and that both allies should thus refrain from any immediate steps toward enlarging their empires. The British did go on to proclaim a protectorate over Egypt on Dec. 18, 1914, and to depose the pro-Turkish khedive, Abbas II Hilmi, but desisted from annexation.

Nejd Treaty and McMahon Letters.—Meanwhile, in the Ottoman dominions themselves British agents entered into separate and uncoordinated negotiations with Muslim leaders, endeavoring to detach them from the leadership of Sultan Mohammed V. The government of India sent first Capt. W. H. I. Shakespeare, the consul

at Kuwait, and then Sir Percy Cox, the resident in the Persian Gulf, to negotiate a treaty with Sheikh ibn-Saud. Signed on Dec. 26, 1915, this treaty recognized ibn-Saud as independent ruler of the Nejd and its dependencies, promised him defense, and granted him a subsidy in return for his friendly neutrality. The government of Egypt at the same time entered into correspondence with Husayn (Hussein), the sherif of Mecca. In a series of letters exchanged in 1915 and 1916, Sir Arthur Henry McMahon, the high commissioner in Cairo, promised Husayn "the independence of the Arabs" from the 37th parallel south, except for the coastal region "lying to the west of the districts of Damascus, Homs, Hama and Aleppo." In return, the sherif agreed to be advised exclusively by representatives of the British government and to give Britain administrative privileges in the vicinity of Baghdad and Basra. Vague though their language was, these letters obviously contradicted the assurance given to Husayn's rival, ibn-Saud, and when Husayn on June 5, 1916, proclaimed an Arab revolt against the Turks and on Oct. 29, 1916, declared himself king of the Arabs, the British cabinet had to announce with some embarrassment that it could only recognize him as king of the Hejaz.

Sykes-Picot Agreement.—By that time, furthermore, the whole situation had been complicated even further by an Anglo-French agreement which was consistent neither with the Nejd treaty nor with the McMahon-Husayn letters. After signing the straits agreements with Russia in March and April 1915, the two western European allies had commenced negotiations to define their "aspirations... in the Ottoman Empire." Sir Mark Sykes acted for Britain; Georges Picot, for France. By the spring of 1916 the two negotiators had arrived at an understanding, the Russian government had given its approval, and a formal Sykes-Picot agreement was signed on May 16. It provided that Russia should receive, in addition to the straits, the Armenian provinces of Turkey—Erzurum, Trebizond, Van, and Bitlis—and northern Kurdistan along the line Muş-Siirt-Amadiya to the Persian border. France was to have Cilicia—that is, the area west of the Armenian provinces and south of the line Ala Dağ-Kayseri-Ak Dağ-Yildiz Dağ-Egin (now Kemalîya)-Kharput—and the Syrian coast inland to Damascus, Homs, Hama, and Aleppo and south to the area of Haifa. Britain was to have Haifa and Acre on the coast and all of southern Mesopotamia, including Baghdad, while the area between the British and French holdings was to be divided into a zone of French influence covering the Syrian hinterland to Mosul and a British zone from there southward. Alexandretta (now İskenderun) was to become a free port, and Palestine was to be internationalized. Though the agreement made provision for one or more independent Arab states in the zones of influence, the terms did not accord with the pledges made either to Husayn or to ibn-Saud. Partly for this reason, the British and French endeavored to keep its provisions secret.

St.-Jean-de-Maurienne Agreement.—Italy nevertheless acquired a general knowledge of the Sykes-Picot understanding, and early in 1917 she asked for a supplementary accord with the other Allies in order to make more precise the vague clause about Turkish territory in the Treaty of London of 1915. On April 17, 1917, the premiers of Britain, France, and Italy signed an agreement providing that Italy should have the right to

annex most of the Vilayet of Konya, the sanjaks of Mentese (now Muğla), Antalya, and Icel, and the vilayet and city of Smyrna (now Izmir), and to have a sphere of influence north of Smyrna. But this agreement stipulated that the concurrence of Russia was required. Because of the revolution in Russia, that concurrence was never obtained, and the agreement remained inoperative. Aside from an informal understanding, reached by the British and French premiers in December 1918, that Britain should have Mosul in return for giving France a share in northern Mesopotamian oil, this St.-Jean-de-Maurienne agreement was the last inter-Allied compact to touch on the future of the Ottoman Empire.

THE NEUTRAL NATIONS

At the outset of the war international law affecting belligerent-neutral relations was vague. The London Naval Conference of 1908-1909 had produced the Declaration of London (q.v.), codifying rules for the protection of neutral commerce, but by 1914 it had not been ratified by any of the major belligerent states. The United States formally asked that all the warring nations abide by the declaration, and the British, French, Russians, Germans, and Austrians agreed to do so but reserved the right to modify its terms as conditions changed. The declaration included lists of items that were to be treated as contraband, absolute contraband, and noncontraband. When it accepted the declaration, the British government added a few new items to the contraband list, and nearly every month brought forth a new order in council extending the list still further. In February 1915, after the German government had confiscated stocks of food in Germany, food was in practice treated as absolute contraband; on Aug. 21, 1915, cotton was taken from the noncontraband category and added to the contraband list; and on July 7, 1916, the government announced that it was abandoning the declaration altogether. In nearly every instance the French and the Italians followed suit.

Meanwhile, the Allies were jointly exerting other pressures on neutrals that might trade with their enemies. They urged neutral governments to establish embargoes on commodities that might be militarily useful to the Central Powers; they rationed shipments to nations bordering Germany and Austria-Hungary so that those nations were able to import no more than they had before the war; they published blacklists of neutral firms that traded with the Central Powers, forbidding their own subjects to have dealings with such firms; and they denied to neutral shippers the right to buy coal in Allied ports except on the condition of signing bunkering agreements, or pledges not to trade with or carry goods for the enemy. In addition, beginning in March 1915, they established an undeclared blockade. Though for technical reasons avoiding use of the term "blockade," the British government on March 1 announced that it would endeavor to seize all "ships carrying goods of presumed enemy destination, ownership, or origin," and the French and Italian governments soon did likewise. The Allies thus made every effort to stop all flow of goods into and out of the territory of the Central Powers.

Owing to their geographical situation and their relatively limited naval capabilities, the Central Powers could not retaliate in kind. They pressed Continental neutrals to curtail trade with

the Allies, but they were able to strike at the seaborne commerce of Britain, France, Italy, and Russia only by employing novel devices and methods. In November 1914, the Allies had sown mines in the North Sea in order to prevent the German High Seas Fleet from sailing forth, and they had given notice that neutral vessels would enter this "mine war zone" at their peril. In the meantime, the Germans had discovered that submarines could elude the Allied naval patrols and operate even off the mouth of the Thames River. Exploiting the precedent set by the mine war-zone decrees, therefore, the German government announced on Feb. 4, 1915, that, effective February 18, it would consider all the waters around Great Britain and Ireland as constituting a "war zone," that in this zone its submarines would endeavor to sink all Allied shipping, and that submarine commanders could not guarantee the safety of neutral vessels. Subsequently, the German government gave assurances that it would do its best to prevent injury to neutral interests, and in practice submarines generally refrained from attacks even on Allied vessels if they seemed likely to be carrying neutral passengers. Not until Jan. 31, 1917, did the German authorities proclaim unrestricted submarine warfare. Thereafter, however, submarines sank Allied and neutral ships indiscriminately.

Netherlands.—At the outbreak of the war the Dutch mobilized to defend their frontiers but also issued proclamations of neutrality. Though public opinion veered sharply toward the Allies as a result of the German invasion of Belgium and the alleged atrocities committed by German forces there, the government held to its course. After a time it became clear that the nation probably did not have to fear attack by the Germans, for Amsterdam was proving useful to them as a port of entry for goods from overseas. By the spring of 1916, the Dutch were more anxious over rumors that the Allies might invade their country in order to attack the rear of the German armies in France. To fend off threats from either side, the government kept the armed forces in a continual state of partial mobilization.

Meanwhile, both the Allied economic war and the German submarine campaign weighed heavily on the Dutch economy. To satisfy the demands of the Allies, the government formed on Nov. 23, 1914, the Netherlands Overseas Trust Company, an organization of Dutch importers who were allowed by the Allies to receive goods on their guarantee not to re-export them to Germany or use them to replace Dutch goods so exported. Even this trust found itself severely rationed, however, and throughout the war the nation's vital export-import trade was much curtailed. The government protested to London and Paris about rationing, blacklists, and bunkering agreements. It also protested against British interference with the mails, the mine war-zone decrees, and specific violations of Dutch territorial neutrality by Allied warships and aircraft. At the same time, it protested against similar violations of Dutch neutrality by the Germans and against the submarine campaign. The government complained in particular of the sinking of the *Katwyk* in April 1915, of the *Tubantia* and the *Palembang* in March 1916, and of four grain ships in February 1917. In some cases, Germany apologized and offered reparations, while in others it disclaimed responsibility or justified the sinkings. Finally the Netherlands government, with

Germany's assent, took over German shipping in the Netherlands East Indies to replace some of the lost tonnage. In March 1918, when the government acquiesced under protest to the seizure of all Dutch ships in American and Allied ports and accepted compensation for them, Germany declared this action unneutral and brought on a crisis by demanding the right to ship supplies through the Netherlands to Belgium. The Dutch achieved a compromise agreement with the Germans and thus managed to maintain their neutrality to the end of the war.

Switzerland.—Though the neutrality of Switzerland was guaranteed by international agreement, the Swiss government took care after the outbreak of the war to keep its armed forces at maximum strength. The German-speaking majority of the population was pro-German, while the French-speaking and Italian-speaking population was generally pro-Ally, but the government was determined to maintain neutrality at any cost. It established a press censorship intended to hold down partisanship, and when there occurred public demonstrations, such as an anti-German riot that took place at Lausanne early in 1916, it apologized immediately to the potentially offended nation. Though both sets of belligerents carried on espionage and similar activities from headquarters within the country, the government attempted to suppress them only when they involved Swiss citizens and thus jeopardized the nation's neutrality.

The official policy did not, of course, spare Switzerland the penalties imposed by the belligerents' economic warfare. Like the Dutch, the Swiss protested the undeclared Allied blockade and the German submarine campaign. Dependent on imports of coal from central Europe and imports of food from overseas, however, they had to make concessions to both sides. On Oct. 11, 1915, they created the Swiss Economic Surveillance Society, a foreign trade corporation similar to the Netherlands Overseas Trust Company, whose members promised the Allies that imported goods would not be passed on in any form to the Central Powers. In September 1916, the government negotiated an agreement with Germany by which cattle, cheese, and aluminum were to be exchanged for coal, iron, and steel; and in May 1918, it arranged with the Allies to receive food in exchange for timber. London, Paris, and Rome protested the Swiss-German compacts, while Berlin and Vienna protested any agreements between the Swiss and the Allies. As a result, imports into Switzerland became increasingly meager, and by the time the war ended the population was on very short rations. But the majority of the people remained firm to the end in adherence to their traditional neutrality.

Denmark.—In Denmark public opinion was anti-German. Nevertheless, the government proclaimed its neutrality and simply mobilized part of the army and strengthened frontier defenses. It formed two merchant guilds, which the Allies allowed to receive imports on a guarantee against re-export to Germany. In 1915 it agreed to dispose of meat in the prewar ratio, with half going to Great Britain, 14 percent to Germany, and the rest for home use; to divide butter evenly; and to give Britain five eighths and Germany three eighths of its fish.

Norway.—Norway was pro-British from the outset, and though the Allied blockade sometimes aroused resentment, public anger rose most often

against Germany on account of the losses of shipping and life caused by submarines. Some of the earlier losses were apologized and paid for. By 1916 Norwegian merchants were signing contracts against re-exporting articles allowed to pass by the Allies, and in October of that year the government forbade all submarines to enter Norwegian waters. By the summer of 1918, nevertheless, 769 ships had been sunk, with a loss of 1,008 lives, and 53 were missing with 704 on board. These statistics were partly offset by the fact that in 1917 Britain cut off Norway's supply of coal because of her export of pyrites to Germany, and only furnished it again on condition that Norwegian ships make trips to France as well as to Norway. In August 1916, the British government contracted for 85 percent of the Norwegian fish catch. (This contract was taken over by the Norwegian government in 1918.)

With less than 4 percent of its area under cultivation, Norway imported a large part of its necessary cereals. Government control of food and, ultimately, strict rationing were found necessary. In addition, whale oil was refined and used to make oleomargarine. A treaty with the United States of May 3, 1918, allowed Norway to import foodstuffs, coal, and farm machinery for home consumption only. In return, timber, wood pulp, fish, metals for munitions, and nitrates were to be shipped to France. While the bulk of Norwegian exports during the war went to the Allies, some were permitted to go to Germany.

Sweden.—Of all the Scandinavian countries, Sweden had shown the strongest German ties. Most members of the court, of army and business circles, of the universities, and of the Conservative Party were sympathetic to the Central Powers. For years fear of a Russian advance across Sweden and Norway to warm water and apprehension of Russian aggression in the Baltic had made Sweden look to Germany for protection. This attitude was carefully stimulated by Germany. A small but aggressive group known as Activists advocated intervention on the side of the seemingly victorious Central Powers, with the hope of securing the Åland Islands and Finland from Russia. The Socialists and Liberals were strongly for peace. The government, however, decided for neutrality, mobilized part of the army, and made common cause with Norway and Denmark in defending neutral rights. In January 1915, export of munitions was prohibited, and in November belligerent submarines were forbidden to enter Swedish waters except in cases of emergency. Apologies were secured for several violations of neutrality, as in 1915, when Russian ships destroyed a German warship inside the three-mile limit, and in 1916, when a German cruiser fired on a Swedish submarine. In July 1916, Sweden closed the exit from the Baltic through Swedish waters, but reopened it after a strong British protest. Perhaps by way of compensation, 10,000 horses were sold to Germany.

Swedish-Russian relations improved somewhat in the course of the war. Trade was brisk, and railroad connections, long delayed for strategic reasons, were made. Thousands of German and Russian invalided prisoners were exchanged through Sweden, and much relief work was done. A crisis was caused in 1916 when Russia fortified the Åland Islands, but it passed when Russia and Britain guaranteed that the fortifications would be removed after the war. The collapse of Russia

removed the fear of that power. Sweden was particularly interested in Finland, where an important minority is Swedish. Beyond assisting refugees to escape, however, it did not intervene. To preserve order, the Åland Islands were occupied on Feb. 19, 1918, but the Swedish forces were displaced by the Germans on March 2.

Sweden objected to British interference with imports and the mails, and by stopping British mail for Russia in January 1916 she became involved in a serious controversy. An arrangement was finally made that reserved Sweden's right to claim damages. Until 1916 the Swedish government refused to permit merchants to make the usual contracts with the Allies concerning re-exports, and it finally agreed to do so only on condition that it supervise the working of the plan in Sweden. Both Britain and Germany wanted Swedish iron ore. By treaty, Sweden was bound to furnish a certain amount of ore to Germany, and the government refused to halt this export, but Britain acquired an increasing share of the Swedish output. Sweden continued to export timber for mine props to Britain despite the fact that Germany declared this material contraband and seized it whenever possible.

Spain.—Spain was more fortunate than the northern neutrals in being farther removed from actual fighting. Nevertheless, there was some danger of her being drawn into the war, particularly through the German submarine campaign. Spain had interests and sympathies with both sides of the conflict. In 1916 she gave assurances to France concerning the Pyrenees boundary and Morocco, and she withdrew some garrisons from the boundary of Portugal, then fighting as Britain's ally. On the other hand, trade with Germany increased, and a number of newspapers were suspected of receiving German money. The mass of the people seemed strongly in favor of neutrality. Liberals, Republicans, and Socialists, through their sympathies with radical and anticlerical France, were pro-Ally. Partly through dislike of French anticlericalism, church leaders, clericals, and Conservatives, together with most army officers, were pro-German. King Alfonso XIII appeared personally to favor the Allies, but he maintained a correctly neutral attitude, and his successive cabinets endeavored to curb violent outbreaks of sympathy for either side.

It was repeatedly charged that German submarines were obtaining supplies at unfrequented places along the coast, and though several damaged submarines were interned in Spain, some escaped, apparently with the connivance of local officials. Nevertheless, the German submarine campaign, especially after February 1917, inflicted heavy damage on Spain. By August 1918, one fifth of the Spanish tonnage had been sunk, much of it outside the area covered by German decrees and some of it even in Spanish home waters, with considerable loss of life. The Spanish cabinet finally announced that future losses would be made good temporarily by using equivalent German tonnage interned in Spanish ports. Germany would not at first agree to this plan. In October, however, preliminary steps were taken to put it into effect, but hostilities ended before much had been done.

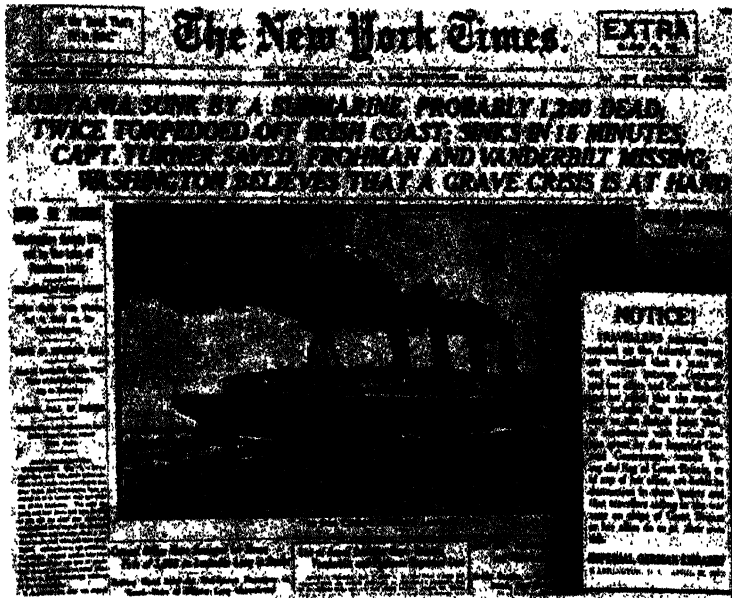

United States.—Neutrality.—From the outset of the war the United States faced formidable problems. As the world's greatest producer of foodstuffs, raw textiles, iron, steel, and petroleum, it carried on a large trade in peacetime with both

the Entente and the Central Powers, and its economic interests were certain to be affected by prolonged hostilities. Moreover, it had a large immigrant population with ties to the warring nations; there was an upsurge of pro-Ally feeling in the country from the moment that Germany invaded Belgium and Britain declared war; there was also an early surge of sympathy for the Central Powers among the large numbers of citizens of German and Austro-Hungarian descent and among Irish Americans, who were traditionally anti-British. On the other hand, President Woodrow Wilson and Secretary of State William Jennings Bryan were eager not only that the United States remain neutral, but that it set an example for other neutral states. In addition to proclaiming formal neutrality, therefore, the president called on the public to be "impartial in thought as well as in action."

Friction with the Allies.—Despite these efforts the government soon found itself drawn into controversies with the belligerents. The State Department asked all the warring states to abide by the unratified Declaration of London. The Central Powers agreed, but the Allies introduced modifications and additions, and the president and secretary of state became concerned lest the Allies not only interfere with American commerce, but also precipitate disputes over neutral rights, such as those which had led to Anglo-American war in 1812. The United States government made a determined effort to persuade the British to accept the Declaration of London *in toto*. When this effort failed, it fell back on a policy of simply protesting specific infringements of neutral rights as defined in traditional international law. Because of the amount of American trade with Europe, the result was a long series of protest notes, some of which attacked in vigorous terms British practices of visit and search, rationing, and additions to the contraband list.

Submarine Issue.—Controversy with Great Britain might have grown more acute had the Germans not issued their submarine war-zone decree in 1915. Wilson and his advisers found the German announcement shocking, for it seemed wholly to disregard the legal right of neutrals to trade with belligerents, and it threatened not only the property but also the lives of neutrals. As a practical matter, furthermore, it put in jeopardy America's growing ocean commerce and the nation's recovery from the recession of 1914–1915. On Feb. 10, 1915, therefore, the secretary of state directed to Berlin a very strong note protesting the decree and warning "that the Government of the United States would be constrained to hold the Imperial German Government to a strict accountability. . . and to take any steps it might be necessary to take to safeguard American lives and property and to secure to American citizens the full enjoyment of their acknowledged rights on the high seas."

Although Germany modified its original threat and offered vague assurances for the safety of neutrals, Wilson remained wary. When the Allies proclaimed their *de facto* blockade in March 1915, Secretary Bryan wished to protest, but Wilson insisted on waiting until the issues raised by Germany were settled. When an American citizen was killed in the torpedoing of the British vessel *Falaba* (March 28), and when an American tanker, the *Gulflight*, was attacked (May 1), the president considered renewing his protest but decided to be patient.

News of sinking of *Lusitania* reaches New York. Inset shows German warning published six days before, on May 1, 1915.

The Bettmann Archive

Lusitania Incident.—On May 7, 1915, however, the giant British liner *Lusitania* (q.v.) was torpedoed in the Irish Sea; 1,198 passengers went down with the ship, and of these 128 were Americans. The American press denounced the action of the German submarine commander as an atrocity, and several leaders of American opinion saw the incident as a justification for war. Even Secretary Bryan, who was almost a pacifist, agreed that some new representations were necessary, and on May 13 a note was dispatched to Berlin calling on the German government to disavow the submarine commander, make reparation for the lives lost, and pledge that in future submarines would not be used against any passenger liners or merchantmen. When the German response proved unsatisfactory, the president ordered that a second note be sent. Bryan could not bring himself to approve it, even though it merely restated the demands in the first note. He resigned on June 8, the day before the note was dispatched, and was replaced by Robert Lansing. When the new German response, dispatched on July 8, proved unsatisfactory, a third *Lusitania* note went to Berlin on July 21. By that time, however, the president was satisfied that the Germans had in fact ceased submarine operations against passenger-carrying vessels and neutral merchantmen, and he elected to let the exchange of notes drag on inconclusively rather than be excessively punctilious and insist on formal compliance with his demands.

Increasing Friction with the Central Powers.—On Aug. 19, 1915, the British liner *Arabic* was sunk with American passengers on board. Though Lansing and others advised taking a strong stand and perhaps severing relations, Wilson chose to delay action in the hope that the German government would voluntarily apologize. Johann Heinrich von Bernstorff, the German ambassador in Washington, did in fact offer an apology, revealing at the same time that German submarine commanders had had orders ever since the *Lusitania* incident to avoid attacks on vessels that might be carrying passengers. Some corre-

spondence ensued before Oct. 5, 1915, when the German government disavowed the act, offered an indemnity, and promised that submarine commanders would, at least for the time being, have orders to follow the traditional rules of international law. Though the submarine issue was less pressing as a result, German-American relations did not become much easier, for the year 1915 and the winter of 1915–1916 brought to light much evidence of espionage and sabotage committed by or financed by German and Austrian agents. This evidence caused the president to ask the recall of the German military and naval attachés, Capt. Franz von Papen and Capt. Carl von Boy-Ed; the Austrian ambassador and consul general in New York, Constantin Dumba and Franz von Nuber; and a German financial agent, Dr. Heinrich Albert, as well as to indict and bring to trial alleged German and Austrian agents.

Wilson's Early Peace Moves.—Despite the *Arabic* settlement, therefore, President Wilson grew increasingly uneasy about the prospects for avoiding conflict with the Central Powers. Though having been in the past an opponent of military preparedness, he changed his mind and in the winter of 1915–1916 became an advocate of limited measures to strengthen the Army and Navy. At the same time, he gave serious thought to promoting a negotiated peace in Europe and thus ending the danger to America's peace. At the very beginning of the war he had tendered his good offices to the belligerents, and he had subsequently explored the possibilities of mediation. By the end of 1915, however, he had come to consider the restoration of peace as not only morally desirable but as important for the interests of his country. Consequently, he approved an extraordinary proposal made to him by his closest friend and unofficial adviser, Col. Edward M. House, and sent House to Europe early in 1916 to seek a secret agreement with the Allies. House was to reach a general accord with the Allies about terms for peace. Then, when the Allied governments gave the signal, the president would issue an open appeal for peace negotiations. The Allies

would accept this appeal. If the Central Powers refused to negotiate or entered into negotiations and refused to accept the terms previously agreed upon by the United States and the Allies, the United States government would join the Allies in the war. House actually arranged a pact along these lines; he and Foreign Secretary Grey initialed a memorandum of agreement on Feb. 22, 1916. Wilson approved it, adding only the word "probably" before "leave the Conference as a belligerent on the side of the Allies, if Germany was unreasonable." But the Allies, perhaps because they interpreted this amendment as meaning that the United States would not carry out its part of the bargain, failed to invite Wilson to issue his appeal, and the agreement came to nothing.

Gore-McLemore Resolutions and Sussex Crisis.—Meanwhile, the president had to weather a domestic crisis. In the correspondence over the submarine issue, the German government had made the point that its undersea craft were at a disadvantage in adhering to the traditional rules of visit and search, for the Allies had fitted a number of merchantmen with large-caliber guns and had given merchant captains instructions to shoot on sight any German or Austrian submarine. Recognizing the force of this contention, Wilson and Lansing asked the Allies if they would not agree to a *modus vivendi*: they would agree to strip the armament from merchant vessels, and the Germans in return would promise that no ship would be sunk without inspection of cargo and provision for the safety of passengers and crew. When the Allies flatly refused, the Americans felt they had no choice but to revert to the position they had taken earlier and to insist that, despite the armament on some Allied vessels, German submarines should be bound by traditional law. News of the proposed *modus vivendi* had, however, leaked into the press, and a number of members of Congress took the view that its rejection entitled the United States to retreat from its position as a defender of neutral rights. Senator Thomas P. Gore of Oklahoma and Representative Jeff. McLemore of Texas, among others, introduced in the Senate and House resolutions which would have forbidden American citizens to take passage on belligerent vessels. The president opposed these resolutions. On Feb. 24, 1916, in an open letter to William J. Stone, chairman of the Senate Foreign Relations Committee, he declared:

For my own part, I cannot consent to any abridgement of the rights of American citizens in any respect. The honor of self-respect of the nation is involved. . . . To forbid our people to exercise their rights for fear we might be called upon to vindicate them would be a deep humiliation indeed. . . . It would be a deliberate abdication of our hitherto proud position as spokesmen even amidst the turmoil of war for the law and the right. . . . What we are contending for in this matter is of the very essence of the things that have made America a sovereign nation. She cannot yield them without conceding her own impotency as a nation, and making virtual surrender of her independent position among the nations of the world.

With this eloquent appeal and by means of various maneuvers, Wilson rallied a bipartisan coalition which decisively defeated the Gore-McLemore resolutions, but the episode had demonstrated that a substantial minority of public opinion was out of sympathy with the administration's policy on the submarine issue.

Scarcely had this demonstration been made than a new international crisis broke out. On March 24, 1916, the British channel steamer

Sussex was torpedoed, reportedly with casualties among Americans on board. Though Secretary Lansing and Colonel House urged the president to act immediately and forcefully, he chose to wait. Then, on April 18, he addressed to Berlin a note declaring, "Unless the Imperial Government should now immediately declare and effect an abandonment of its present methods of submarine warfare against passenger and freight-carrying vessels, the Government of the United States can have no choice but to sever diplomatic relations with the German Empire altogether." On May 4, the German government replied that it was ordering submarine commanders for the time being to suspend all operations against merchant shipping. The United States had thus succeeded once again in achieving a diplomatic victory.

Renewed Friction with the Allies.—While negotiating with the Germans about submarine warfare, Wilson endeavored to avoid controversy with the Allies. He had rejected Bryan's pleas for a protest against the *de facto* blockade of March 1915, and despite outcries from injured growers and exporters he also declined to protest the British order in council of August 1915, adding cotton to the contraband list. Instead, he allowed House to negotiate an agreement under which the British government purchased cotton to stabilize its price. Only on Oct. 21, 1915, after the settlement of the *Arabic* case, did the Department of State file in London a note complaining that the undeclared blockade constituted a departure from traditional international law, and partly because of the continuing uneasiness in German-American relations, this note was relatively mild. After the *Sussex* settlement, however, the president displayed more concern about Allied infringements of neutral rights. Irritated by the failure of the British and French to act upon the House-Grey memorandum of February, he had begun to doubt his original conviction that their attitudes and aims were morally superior to those of the Germans. At his direction, consequently, the Department of State dispatched to London a series of increasingly sharp notes protesting the blacklist, bunkering agreements, and other measures of economic warfare. On Sept. 7, 1916, the president obtained from Congress legislation permitting him to ban imports and deny clearance to ships, and he let the British government know that he might make use of these powers to retaliate against the Allies if they did not modify their course.

Wilson's Final Peace Efforts.—The position of the United States government was difficult by the closing months of 1916. The Allies showed no sign of making concessions to the American demands, and there was danger that friction with them would become increasingly acute. There was even greater danger of a new crisis with Germany, for reports from Berlin told of mounting demands in military and naval circles and in the Reichstag for unrestricted submarine warfare. But the presidential election campaign of 1916, in which Wilson had succeeded in achieving reelection, had shown beyond doubt that much of the public wanted the nation to remain uninvolved in the European conflict. Many observers believed, indeed, that Wilson had won because his supporters used the slogan "He Kept Us Out of War." There was thus a real possibility that the president might be forced to retreat from the positions he had taken in defense of international

w and neutral rights and to yield the very things at in his letter to Chairman Stone he had said America could not yield "without conceding her an impotency as a nation, and making virtual surrender of her independent position among the nations of the world."

In these circumstances, Wilson turned again to the hope that negotiations might restore peace in Europe before a crisis arrived in United States relations with either the Allies or the Central Powers. With the help of his advisers, he drafted a note to the belligerent governments, asking them to inform him confidentially of the terms of peace which they would accept so that he might investigate possibilities for a settlement of the war. Before the president had decided to dispatch this note, Chancellor von Bethmann-Hollweg called publicly on Dec. 12, 1916, for peace negotiations, perhaps believing that the restoration of peace was the only means of avoiding a decision for unrestricted submarine warfare, perhaps hoping thereby to make such a decision less unacceptable in American eyes, or perhaps simply concerned that Austro-Hungarian morale was crumbling and that the new Austrian emperor, Charles I, might seek a separate peace. Though the Allies declined this German invitation, Wilson nevertheless elected on December 18 to send his peace note to all the warring governments. As it turned out, the Central Powers replied brusquely on December 26 that any discussion of terms should be among the belligerents, and that they would reserve any statement until such discussions began, while the Allies responded on Jan. 10, 1917, with a statement of relatively mild terms. Hoping to induce the Germans and Austrians to change their minds, he president on Jan. 22, 1917, delivered an address to the Senate calling on both sides to accept "a peace without victory."

End of American Neutrality.—The German government gave an unencouraging answer to Wilson's appeal. On January 31, moreover, it suddenly announced that beginning the next day submarines would attack any and all vessels in the earlier-defined war zone. The decision in favor of this decree had been made by the German government in a crown council held at Schloss Jless on Jan. 7, 1917; the military and naval authorities had united in demanding it; and the Reichstag, in a resolution of Oct. 11, 1916, had declared that it would abide by the decision of Field Marshal Paul von Hindenburg and Gen. Erich F. W. Ludendorff, and these two officers advocated it. The chancellor and his civilian supporters had been unable to hold out, even though they felt certain that the decision was tantamount to a declaration of war against the United States. Wilson, in view of his earlier pronouncements, had no choice except to sever diplomatic relations, and he did so on Feb. 3, 1917.

In succeeding weeks the president waited in hope that the German government would back down, as it had in the past, but he was disappointed. The British liner *Laconia*, with Americans on board, was torpedoed on February 25, and several American vessels also were sunk. In addition, the British government communicated a copy of an intercepted message of January 19 from the German foreign minister, Arthur Zimmermann, to the German minister in Mexico, proposing a German-Mexican-Japanese alliance against the United States. The sinkings and the Zimmermann telegram, which was made pub-

lic on March 1, aroused violent feelings among the American public, and the pacifist element, led by former Secretary of State Bryan, appeared a shrinking minority. In late February, when the president asked Congress for authority to arm American merchantmen, action was blocked by a small minority, whom Wilson assailed as "a little group of willful men, representing no opinion but their own," but large majorities in both houses indicated that they would have approved if given the chance to vote. Within six to eight weeks after the publication of the German decree, the president had reluctantly concluded that the United States could not remain neutral, and that it had no choice except to intervene in the war. Consequently, he went before Congress on April 2, 1917, and asked for a declaration of war, saying that the nation would fight "for the ultimate peace of the world and for the liberation of its peoples, the German peoples included: for the rights of nations great and small and the privilege of men everywhere to choose their way of life and of obedience. The world must be made safe for democracy." The Senate approved the declaration of war on April 4 by a vote of 82 to 6; the House, on April 6 by a vote of 373 to 50.

Latin America.—The vicissitudes of the American republics as neutrals resembled those of the United States. All Latin American governments issued proclamations of neutrality soon after the outbreak of the war, and all put in force much the same stringent rules as those adopted in Washington. Each state had to contend, however, with the violent partisanship of pro-Ally and pro-German elements in public opinion. Owing partly to economic and cultural ties with Britain and France, the pro-Ally factions were in most places predominant; only in Argentina and Chile did large numbers of intellectuals and army officers sympathize with Germany.

Each state encountered difficulty in maintaining its neutrality. Colombia, for example, became engaged in lengthy correspondence with the British government because of the operation of a German radio transmitter at Cartagena, and the issue was resolved only by the closing of the station in December 1914. Chile felt itself obliged to protest to the German government because of violations of its neutrality by German commerce raiders operating in the southern Pacific, for a German squadron on two occasions in 1914 overstayed the lawful time limit and drew excessive quantities of coal and supplies from harbors in Chilean-owned islands. This dispute was not settled until the Berlin authorities finally apologized in July 1916. Each state also found its relations with the belligerents irritated because of interference with neutral trade. Most Latin American governments protested or complained of the Allied blacklists, bunkering agreements, and import restrictions. Though none joined the United States in protesting the German submarine decrees of 1915 and 1916, all those with merchant shipping warned the German government that they would not disregard injuries to their vessels or citizens.

The breach between the United States and the Central Powers required nearly all the Latin American republics to re-examine their policies. President Wilson suggested that all of them

should imitate his action. In Cuba and Panama, where American influence was strong, the governments acquiesced promptly; both declared war on April 7, 1917. Bolivia endorsed the American position on the submarine issue and then, on April 13, 1917, severed relations with Germany on the ground that Bolivian citizens had been endangered by the sinking of the Dutch ship *Tubantia* in March 1916. Guatemala took the same action on April 27, 1917, because of Germany's failure to reply to its note of protest against submarine warfare. Honduras on May 17, 1917, and Nicaragua on May 19, 1917, severed relations with Germany, and both followed eventually with declarations of war—the former on July 19, 1918, and the latter on May 8, 1918. Costa Rica, though its government was not recognized by that of the United States, offered the hospitality of its waters to the United States Navy; on Sept. 21, 1917, broke relations with Germany; and on May 23, 1918, declared war. Uruguay at first declared itself neutral in the American-German war, but in June 1917 it issued a decree invoking "the principle of American solidarity," and declaring that no American nation "which in defense of its own rights should find itself in a state of war with nations of other continents will be treated as a belligerent." The Uruguayan government then opened its ports to American warships. On Oct. 7, 1917, it proceeded to break off relations with Germany, but despite submarine incidents involving Uruguayan citizens it did not go on to a declaration of war.

Peru severed relations with Germany on Oct. 6, 1917, and Ecuador followed suit on Dec. 7, 1917, but both stopped short of declaring war. The Dominican Republic, occupied by the United States, had no legal existence at the time. Haiti, though also occupied, retained nominal sovereignty, and its National Assembly refused in May 1917 to issue a declaration of war. Subsequently, however, the assembly was dissolved and replaced by a Council of State, and this body complied with the wishes of the occupying power by declaring war unanimously on July 12, 1918. Paraguay proclaimed its sympathy for the United States but did nothing more. The Venezuelan government, after first refusing to state even moral approval of the American stand, shifted ground and on May 3, 1917, issued a proclamation like the Paraguayan. The Mexican government, which enjoyed an uneasy relationship with the United States, proposed in February 1917 that the American republics take common action to bring the war to an end. When this appeal was rejected, it simply lapsed into a strict neutrality, which it maintained throughout the war. El Salvador and Chile likewise remained neutral. Of the American republics, eight joined the Allies—Cuba, Panama, Guatemala, Nicaragua, Honduras, Haiti, Costa Rica, and Brazil; four broke off relations with Germany—Bolivia, Uruguay, Ecuador, and Peru; and seven maintained their neutrality—Paraguay, Venezuela, Mexico, El Salvador, Colombia, Chile, and Argentina.

Brazil.—Brazil, the greatest of the Latin American states, had the closest relations with the Allies. In addition to ties with Britain and France, it possessed historic links with Portugal, and it had a large Italian population, principally in São Paulo. Partly in consequence, its people reacted immediately to the outbreak of war; Brazil became the only neutral state to protest the German invasion of Belgium. Despite increasing irritation

in relations with the Allies, due mainly to British interference with the coffee trade and with Brazil's substantial merchant marine, public sympathy for the Allied cause showed no marked diminution. In February 1917, when the Brazilian government filed a protest against the 1916 sinking of the *Rio Branco*, there was public rejoicing. When the *Paraná* went down on April 4, 1917, with three Brazilian crewmen among the dead, mobs attacked German properties. After the *Tituca* was sunk on May 20, the government responded by seizing interned German merchantmen, and on Oct. 26, 1917, after the *Macau* also had gone down, the Senate voted unanimously, and the Chamber of Deputies by 149 to 1, in favor of a declaration of war. Because of its own grievances and quite independently of the United States, Brazil thus became one of the Allied and Associated Powers.

Argentina.—The Argentine Republic, then second among the Latin American states, also followed an independent policy. Though its people appeared largely pro-Ally, it had a considerably larger pro-German faction than its Portuguese-speaking neighbor. At the outset of the war its government endeavored to establish a neutrality even stricter than that of the United States. It forbade its ports to armed merchant vessels on Aug. 17, 1914, and subsequently interned several vessels that disregarded this rule. On Dec. 8, 1914, it forbade any Argentine vessel to send radio messages without prior official clearance. In addition, it made representations to the British and German governments about interference with trade and submarine warfare. On April 10, 1917, President Hipólito Irigoyen issued a cautious statement of sympathy with the United States, and on April 21 his Foreign Ministry filed a strong protest in Berlin about the torpedoing of the *Monte Protegido*. The German government promised an indemnity for this vessel, however, and subsequently offered compensation for two other Argentine ships that were sunk.

Nevertheless, public opinion became increasingly anti-German, and in 1917 there were widespread demands for the severance of relations or even for a declaration of war. The pretext was the publication by the United States in September of intercepted correspondence from the German minister in Buenos Aires, Karl von Luxburg, in which the Argentine foreign minister was described as "a notorious ass and Anglophile," and the German government was counseled either to spare Argentine vessels or to make sure that they were sunk without trace [*spürlos versenkt*]. Both houses of the Argentine Congress voted in favor of breaking relations, but President Irigoyen refused to ratify their action and succeeded on September 23 in winning from the German government an apology and a disavowal of the minister's words. He then kept Argentina neutral until the end of the war.

China.—At the outbreak of war, China was still in turmoil following the revolution of 1911 and the overthrow of the Manchu dynasty in 1912. The president of the Chinese Republic, Gen. Yuan Shih-k'ai, envisioned a restoration of the monarchy with himself as the founder of a new dynasty, and in 1915 he approached the Allied governments with the suggestion that they grant recognition to such a monarchy in return for China's joining them in the war. The British, French, and Russian governments were not un-receptive, but the Japanese government vetoed

the project. Then, with the death of Yüan in June 1916, such national unity as had existed in China practically disappeared. The government and National Assembly in Peking ceased to exercise control much beyond the boundaries of the capital city, and actual rule lay with various war lords commanding separate districts and living in uneasy alliance with one another.

The officials in Peking hoped to restore central authority and saw intervention in the war as a means of doing so. When the United States severed relations with Germany in February 1917, they approached the American minister with a proposal that China follow suit in return for a \$10 million loan from the United States. The minister readily agreed, only to have his action disavowed by the Department of State, which had no wish to seem to be purchasing Chinese support. The Peking authorities then turned to the Allied governments, suggesting that China might join them if suitably compensated. The European cabinets were still interested, and by this time the Japanese government had not only reconciled itself to China's entering the war but had decided that Japan might reap positive benefits therefrom. The Foreign Office in Tokyo asked Britain, France, and Russia for assurances of support for postwar Japanese demands in Shantung and the North Pacific and, after receiving them, notified both the Allies and the Chinese of its willingness to have China as an ally.

On Feb. 24, 1917, a French ship, the *Athos*, had been torpedoed in the Mediterranean, with 543 Chinese coolies among the dead, and the Peking authorities on March 14 gave this incident as their reason for breaking off relations with Germany. Great dissension then arose over the issue of proceeding to a declaration of war. The National Assembly, on May 11, refused to vote such a declaration. Within a month the entire central government had been dissolved. Troops of the northern war lords entered Peking and installed a new cabinet, and on Aug. 14, 1917, this body declared war by proclamation. China thus became, at least in name, one of the Allies.

TERMINATION OF THE WAR

First Signs of Peace.—From the onset of hostilities neutral governments, peace advocates in the neutral states, and pacifists in the belligerent nations had kept their eyes open for any opportunities to end the war. The United States Department of State had quietly explored such possibilities during Bryan's tenure as secretary, and Colonel House had traveled to Europe in 1915 and 1916 as President Wilson's unofficial emissary, investigating the attitudes of the warring governments with regard to peace terms and peace negotiations. Similar unofficial missions had been sent out in 1915 by the kings of Denmark and Sweden. In December of that year, a wholly nongovernmental effort was undertaken by a group headed by the American motor car manufacturer Henry Ford. Responding to appeals from such peace advocates as Jane Addams and Rosika Schwimmer, Ford chartered a ship, the *Oscar II*, sailed for Europe with a large number of pacifists, and announced that the group would sponsor a peace conference for the belligerents; the ship's radio broadcast the message "Out of the trenches by Christmas." But as none of the Scan-

dinavian states would serve as host for the proposed conference, Ford gave up and went home, and the sessions finally held at The Hague in January 1916 proved inconsequential. The same fate attended international conferences of Socialists, including a much publicized one scheduled to be held at Stockholm in the summer of 1917.

Sixte Affair.—By the end of 1916, more than one of the belligerent governments had begun to consider the possibility of suing for peace. The German chancellor's public appeal of December 12 had been prompted not only by considerations rising from the submarine controversy with the United States, but also by pressure from Austria-Hungary. The new head of the Dual Monarchy, Emperor Charles I, was concerned about the possibility of internal collapse, and, in addition to urging the Germans to propose general negotiations, he suggested to his mother-in-law, Archduchess Maria Antonia of Bourbon Parma, that an approach to the French government be made through the Bourbon princes serving in the Belgian Army. Arrangements were made, and in February 1917, Prince Sixte (Sixtus) of Bourbon met with a personal envoy of the emperor at Neuchâtel, Switzerland, to receive a statement of Austrian conditions for peace. In effect, the emperor proposed a restoration of the *status quo ante bellum*.

When Sixte reported verbally to the French government on the Austrian proposal, President Raymond Poincaré and Premier Aristide Briand proved receptive. In March, they sent Sixte back to Switzerland to meet again with the Austrian representative and suggest an armistice providing for immediate cessation of hostilities on the Austro-Hungarian fronts. The French asked only that Austria agree in principle that Alsace-Lorraine be returned to France by Germany, that Belgium be restored to independence and indemnified, that the Kingdom of Serbia be restored and given an outlet to the Adriatic through Albania, and that Russia have Constantinople. Sixte not only presented these terms to the Austrian envoy but proceeded to Vienna and laid them before the foreign minister and the emperor. The Austrian government agreed to take them under advisement and actually went on in later March and early April to discuss their substance with the German chancellor and William II, though without disclosing the fact that negotiations with France were in progress.

While the Austrians studied the Poincaré-Briand proposals, Briand ceased to be premier of France. His successor, Alexandre Ribot, was personally hostile to the Bourbon princes and had more confidence than Briand in the ultimate triumph of the Allies. Ribot insisted on discussing the Sixte negotiations with the British prime minister, David Lloyd George, and in conversations that took place at Folkestone on April 11, 1917, he pointed out a fact which Briand had elected to disregard. The territorial pledges given by the Allies to Italy and Rumania in the secret treaties of London and Bucharest were inconsistent with the terms that had been outlined for the Austrians. Lloyd George agreed that the gist of the Franco-Austrian negotiations had to be disclosed at least to the Italians. This was done during the meeting of the British, French, and Italian premiers at St.-Jean-de-Maurienne in April 1917, and the Italian proved obdurate in insisting on literal fulfillment of the Treaty of London. Thus, though Sixte visited Vienna again in May,

the project was for all practical purposes abandoned. Later talks in Switzerland between other Allied and Austrian representatives were similarly inconclusive.

Reichstag Peace Resolution.—The German government was meanwhile put under pressure not only by its weakening ally, but also by a growing body of domestic opinion favoring some negotiated settlement of the war. At the outset of hostilities the Social Democratic Party had only voted to support the government after considerable debate, and the majority of its leaders maintained the position that the nation should stop fighting whenever its enemies conceded that they could not triumph. They combated Pan-Germans and others, generally of the right-wing parties, who insisted that the country should annex Belgium, Poland, or other such territories; they were supported in this moderate stand by members of the Progressive Party and of the left wing of the Catholic Center Party; and these three groups together constituted a majority in the Reichstag. When Chancellor von Bethmann-Hollweg issued his peace appeal in December 1916, this majority enthusiastically supported him.

When this act was followed by the rejection of Wilson's peace note, the declaration of unrestricted submarine warfare, and war with the United States, the majority's leaders became concerned that their government was not pursuing peace with sufficient energy. Consequently, despite objections from the chancellor and the high command of the army, they brought before the Reichstag a resolution declaring: "Germany has taken up arms in defense of her freedom, her independence, and the integrity of her soil. The Reichstag strives for a peace of understanding and a lasting reconciliation among peoples. Violations of territory and political, economic, and financial persecutions are incompatible with such a peace." It was passed on July 19, 1917, by a vote of 212 to 126. But the new chancellor, Georg Michaelis, accepted it in a speech that interpreted away much of its meaning, and shortly afterward one of the Center Party leaders justified the resolution to a party caucus by citing a secret memorandum on the faltering morale of Austria-Hungary. Thus, like the peace appeal of December 1916, the Reichstag resolution came to seem a tactical expedient employed by a nation still bent on achieving victory.

Papal Peace Effort.—The Center Party's leaders had been prompted to support the peace resolution in part because they had had intimations that the Vatican was about to urge peace negotiations. Pope Benedict XV, installed shortly after the outbreak of war, had previously refrained from any action that might be interpreted as interference with the belligerents, or that might occasion criticism among anticlerical parties in France, Italy, and Austria or the Protestant and Orthodox majorities in Germany and Russia. By mid-1917, however, he had decided that the time had come for an effort to bring the warring governments together, and in June he sent Monsignor Eugenio Pacelli (later Pope Pius XII) to Germany to sound out opinion there. Pacelli reported that the chancellor held very moderate views, while the kaiser and the generals commanding the armies were noncommittal but not intransigent. Other envoys evidently sent in comparable reports with regard to the other belligerent governments; the Reichstag passed its peace resolution; and on Aug. 1, 1917, the pope addressed a public ap-

peal to all the belligerents to accept a peace of compromise, making mutual concessions with regard to territorial issues, otherwise restoring the *status quo ante bellum*, and establishing an international organization for arbitration.

Journalists and officials in the Allied countries generally viewed this papal note as having been inspired by Germany and, like the Reichstag resolution, as constituting either a trick or a sign of approaching collapse. None of the Allied governments except the American made a formal reply. President Wilson's answer of August 27 stressed the moral objections to negotiations with governments that had, in his view, initiated an aggressive war and pursued throughout a policy of aggrandizement and conquest. The British government did, however, return an informal and confidential reply suggesting that the Allies might be willing to enter into further discussions if they were assured that Germany would restore and indemnify Belgium and agree to terms that would make renewal of the war impossible.

The Vatican communicated this word to Berlin and waited hopefully for the response of the German government, but the leaders of the German Army and Navy, supported by the representatives of right-wing groups, remained insistent that the war leave Germany in complete or partial control of Belgium. After a conference on Sept. 11, 1917, among a number of the kaiser's highest officials, it was agreed that the reply to the pope should be moderate in tone but make no promise with regard to Belgium. When this reply was received at the Vatican, Benedict asked the German government to reconsider the possibility of offering a guarantee on Belgium, but the authorities in Berlin responded by making their previous answer public. This ended for the time being all chance of further negotiations.

Collapse of the Eastern Front.—Though Russia had been the first of the Allied powers to go to war, and the Russian government had agreed in the Pact of London to engage in no separate negotiations with the Central Powers, the possibility of Russia's making a separate peace had existed from the very beginning. A number of members of the Russian aristocracy remained pro-German, and at various times individuals from the Russian court circle had talked unofficially with representatives of the Central Powers about possible negotiations. Count Sergei Witte, who had often in the past been a spokesman for the nation's rising commercial and industrial groups, spoke in favor of Russian withdrawal from the war. So did leaders of the growing radical, socialist, and revolutionary parties.

The government that came into power after the Revolution of March 1917 was committed to continuing the war. It backed away from the policy of the czarist government only by proclaiming on April 9, 1917, that its aim was "not the forcible seizure of foreign territories, but the establishment of a stable peace on the basis of the self-determination of peoples." When the Bolsheviks seized power in November 1917, however, they went further; on November 8, the Congress of Soviets passed a resolution calling on all the warring powers for "an immediate peace without annexations. . . and without indemnities"; on November 21, the new commissar of foreign affairs, Leon Trotsky, formally asked the Allies to agree to negotiations on such a basis. The Allied governments refused even to receive the communication. Conferring later that month in Paris, the Allied

leaders agreed that they would not release Russia from its commitment under the Pact of London; they declared simply that the Allies "would proceed to a revision of war aims together with Russia, so soon as there shall be a government aware of its duties to the country and defending the interests of the country and not of the enemy."

Peace of Brest-Litovsk.—The Bolsheviks nevertheless sent representatives under flag of truce to propose to the German and Austrian military authorities an armistice and the prompt opening of negotiations for a general peace. Conversations opened on Dec. 3, 1917, in the fortress of the Polish town of Brest-Litovsk (now Brest). Though the Russian delegates endeavored at first to discuss only terms for a general armistice, they eventually agreed to talk of an armistice for the eastern front alone. On December 15, agreement was reached on a 28-day cessation of hostilities (from December 17), during which time terms for a final settlement were to be negotiated. On December 22, delegations representing the Bolshevik government and the Central Powers gathered at the same place. The German government had meanwhile concluded that it would insist at least on Russian abandonment of the Baltic provinces. (Hindenburg had declared at a crown council at Kreuznach on December 19, "I need them for the maneuvering of my left wing in the next war.") The Bolsheviks, however, called for the application of the principle of self-determination; and on December 28, the conference was adjourned temporarily so that the Russians could receive fresh instructions and make one last appeal to the western Allies to join the negotiations.

After the conferees reassembled in January 1918, the Ukrainian Rada proclaimed the independence of the Ukraine. A separate Ukrainian delegation appeared at Brest-Litovsk, and the Russians reluctantly agreed in accordance with their own principles, that it could negotiate for the Ukraine. Consequently, on February 9, the Central Powers signed with the Ukrainian delegates a treaty re-establishing peace and providing that the Ukraine should immediately supply Austria-Hungary and Germany with grain. The Austrians, desperately in need of food, agreed to cede to the new state the district of Chehm, to guarantee certain civil rights to the Ruthenian population in the rest of Galicia, and to create a separate crown land for the Ukrainians of eastern Galicia and Bucovina.

Negotiations between the Central Powers and the Bolsheviks had continued in the meantime. The leaders of the German delegation insisted in effect that all territory under the control of the German Army be renounced by Russia. Trotsky, now leading the Russian delegation, tried to oppose this demand. He also opposed the Ukrainian treaty. Pointing out that bolshevism was spreading in the Ukraine, he withdrew recognition from the Ukrainian government. The Germans refused either to accept his position or to retreat from their own. In consequence, on February 10, Trotsky resorted to the expedient of declaring that the Russian government, instead of signing an unjust treaty, would simply proclaim peace and demobilize its forces. Though at first taken aback by this extraordinary procedure, the German government on February 18 responded by terminating the armistice and dispatching troops toward Petrograd.

Disappointed in their hope that the Germans would be compelled to accept their action, the

U.S. War Dept. General Staff

Left to right, Adolf A. Joffe, Lev B. Kamenev, and Leon Trotsky with Central Powers officers at Brest-Litovsk.

Bolshevik authorities appealed for a new armistice. The Germans demanded that they agree to withdraw all forces from the Baltic area and the Ukraine, halt all propaganda activity in central Europe, and immediately open commercial relations with the Central Powers. On February 24, the Russians agreed. Delegations met again at Brest-Litovsk, and on March 3, 1918, a treaty of peace was signed. Under its terms the Russians surrendered all claim to Courland (Kurland) and western Poland and to Kars, Ardahan, and Batum (now Batumi) on the Turkish frontier, and agreed to evacuate Finland, the Åland Islands, Estonia, and Livonia. The treaty was ratified by the Congress of Soviets on March 18 by a vote of 724 to 276 (with 204 abstentions). By a supplementary treaty signed at Berlin on August 27, the Russian government also renounced its claims to Estonia and Livonia. Though neither treaty provided for the actual annexation by Germany of the territories renounced by Russia, both were interpreted by Allied and neutral observers as providing proof of Germany's imperialistic war aims.

Allied Interventions in Russia.—During the negotiations at Brest-Litovsk the Allied governments had continued to hope that Russia might somehow return to the war as an active cobelligerent. Many of the Allied representatives in Russia believed that an alliance with the Bolsheviks might be arranged. After the breakdown in negotiations and the resumption of hostilities by the Germans, the French, British, and United States governments offered sympathy and support to the Russians, but these offers were withdrawn when the armistice was renewed and the treaty signed. In the meantime the three governments had been debating what action might be taken to prevent stores of supplies in Russia from falling into German hands. In February 1918, it was decided for this purpose to land a small combined force at Murmansk, and with the consent of the local Bolshevik organization this was done in March. After the Soviet Congress' ratification of

U.S. War Dept. General Staff

Japanese troops parade in Vladivostok, which was placed under four-power Allied control in July-August 1918.

the Treaty of Brest-Litovsk, the Allies proceeded to enlarge this force and to extend the area of its control. The Russian government protested on June 28, but on July 7 the Murman Regional Council proclaimed the area independent and invited the force to remain. The Allies willingly agreed. The British and French were already contemplating support for counterrevolutionary movements that might overthrow the Bolsheviks, repudiate the treaty, and put Russia back in the war. On Aug. 2, 1918, another combined force occupied Arkhangelsk, and when counterrevolutionaries proclaimed an independent republican government of the north, the Allied commanders at Murmansk and Arkhangelsk gave it quiet support.

Another proposal, which had been debated since early in 1918, called for a Japanese expedition to Siberia. The Japanese government indicated its willingness to take such action if requested by its allies, and military opinion in London and Paris was generally favorable, the British and French general staffs reasoning that an attack on Siberia would not only prevent the supplies stored in that region from being transferred to the enemy, but would also compel the Germans to retain a certain proportion of their forces on the eastern front. Before sanction could be given for a Japanese landing in Siberia, however, the consent of the United States had to be obtained, and President Wilson and his civil and military advisers were all opposed to the plan. In April 1918, when the British and Japanese put a small force ashore at Vladivostok in order to take possession of military supplies there, the United States government protested. The month of May, however, saw armed hostilities break out between the Bolsheviks and a Czechoslovak Legion that had been fighting with the Russians and, by agreement with the French, was being moved across Siberia to Vladivostok in order to be transported to the western front. On June 28, the legion, in company with certain Russian counterrevolutionaries, seized control of Vladivostok, and on July 17 President Wilson gave up opposition to a Siberian expedition, consented to Japanese landings, and agreed to send in American troops. A counter-revolutionary government was formed in Siberia under Adm. Alexander Kolchak, but the American commander, Maj. Gen. William S. Graves, refused to give it any support or encouragement.

The Armistices.—Allied Declarations on Peace Terms.—When the Bolsheviks came to power in Russia, they published the texts of the secret treaties which the Allies had concluded earlier in the war. Allied leaders felt it necessary to counteract any unfavorable impression and also to make public declarations that might reassure the Bolsheviks and encourage them to continue in the war. The first to speak out was the British prime minister. Addressing the Trades Union Congress at Caxton Hall on Jan. 5, 1918, Lloyd George declared that the Allies were not fighting a war of aggression against the German people, that the first aim of Britain was "the complete restoration, political, territorial, and economic, of the independence of Belgium and such reparation as can be made for the devastation of its towns and provinces"; the second was "the restoration of Serbia, Montenegro and the occupied parts of France, Italy and Rumania"; the third, the restoration of Alsace and Lorraine to France; and the fourth, an independent Poland. He concluded:

If, then, we are asked what we are fighting for, we reply, as we have often replied—we are fighting for a just and lasting peace—and we believe that, before permanent peace can be hoped for, three conditions must be fulfilled. First, the sanctity of treaties must be re-established; secondly, a territorial settlement must be securely based on the right of self-determination or the consent of the governed; and, lastly, we must seek by the creation of some international organization to limit the burden of armaments and diminish the probability of war.

Partly so that Lloyd George might not seem the spokesman for all the Allied and Associated Powers, partly because the United States was not a party to any of the secret engagements among the European Allies, and partly because he believed that his nation had a broader and more unselfish view of the needs of the future, President Wilson hastened to issue a statement of his own views. Addressing Congress on Jan. 8, 1918, he outlined "the only possible program" for peace in 14 points:

- (1) Open covenants of peace, openly arrived at. . . .
- (2) Absolute freedom of navigation upon the seas, . . . alike in peace and war. . . .
- (3) The removal, so far as possible, of all economic barriers and the establishment of an equality of trade conditions among all . . . nations. . . .
- (4) Adequate guarantees given and taken that national armaments will be reduced to the lowest point consistent with domestic safety.
- (5) A free, open-minded, and absolutely impartial adjustment of all colonial claims, based upon a strict observance of the principle that in determining all such questions of sovereignty the interests of the populations concerned must have equal weight with the equitable claims of the government whose title is to be determined.
- (6) The evacuation of all Russian territory and such a settlement of all questions affecting Russia as will secure the best and freest cooperation of the other nations of the world in obtaining for her an unhampered and unembarrassed opportunity for the independent determination of her own political development and national policy and assure her of a sincere welcome into the society of free nations under institutions of her own choosing. . . .
- (7) Belgium . . . must be evacuated and restored, without any attempt to limit the sovereignty which she enjoys in common with all other free nations. . . .
- (8) All French territory should be freed and the invaded portions restored, and the wrong done to France by Prussia in 1871 in the matter of Alsace-Lorraine . . . should be righted. . . .
- (9) A readjustment of the frontiers of Italy should be effected along clearly recognizable lines of nationality.
- (10) The peoples of Austria-Hungary, whose place among the nations we wish to see safeguarded and assured, should be accorded the freest opportunity of autonomous development.
- (11) Rumania, Serbia, and Montenegro should be evacuated; occupied territories restored; Serbia accorded free and secure access to the sea; and the relations of the several Balkan states to one another determined by

friendly counsel along historically established lines of allegiance and nationality; and international guarantees of the political and economic independence and territorial integrity of the several Balkan states should be entered into.

(12) The Turkish portions of the present Ottoman Empire should be assured a secure sovereignty, but the other nationalities which are now under Turkish rule should be assured an undoubted security of life and an absolutely unmolested opportunity of autonomous development, and the Dardanelles should be permanently opened as a free passage to the ships and commerce of all nations under international guarantees.

(13) An independent Polish state should be erected which should include the territories inhabited by indisputably Polish populations, which should be assured free and secure access to the sea, and whose political and economic independence and territorial integrity should be guaranteed by international covenant.

(14) A general association of nations must be formed under specific covenants for the purpose of affording mutual guarantees of political independence and territorial integrity to great and small states alike.

Bulgarian Armistice.—In June 1918, Rado-lav resigned as premier of Bulgaria and was replaced by Alexander Malinov, whose enthusiasm for war had always been lukewarm. Through its official press the Bulgarian government began at once to express an interest in negotiations for a separate peace. Meanwhile, morale in the Bulgarian Army was disintegrating, and resistance to continued fighting was evident in Sofia and in the countryside. Fearing revolution, King Ferdinand left for Austria, where he pleaded with his allies to give him reinforcements and to reaffirm their earlier promises with regard to the future enlargement of Bulgaria's frontiers. His appeals went unheeded, and, after long and anguished debate, a crown council in Sofia decided to send an armistice commission to treat with the advancing French force commanded by Gen. Louis Franchet d'Esperey. On Sept. 29, 1918, an armistice was signed at the general's headquarters (it was accepted the next day). By its terms, Bulgaria promised to evacuate all Allied territory; permit the occupation of portions of her own land by French, British, and Italian troops; grant the Allies free passage through Bulgarian territory; give them free control of the Danube River and of Bulgarian shipping on that waterway; demobilize the Bulgarian Army; and turn over to the Allies all rolling stock and other means of transportation.

Turkish Armistice.—With Bulgaria's surrender, Turkey was isolated; the Allies were pressing northward from Syria and Mesopotamia; elements of the Turkish Army were throwing down their arms; and bands of deserters, aggregating perhaps half a million men, were terrorizing the countryside. Shortly after the Bulgarian armistice, therefore, the government of Enver Pasha resigned and gave way to a nonpartisan cabinet headed by Ahmet Izzet Pasha. On Oct. 14, 1918, this new cabinet appealed for an armistice. Negotiators then met on the island of Lemnos, and on October 30 signed an armistice. Under its terms the Turks agreed to open the Dardanelles and facilitate the clearing of mine fields from the straits; surrender officers and garrisons in Tripolitania, Cyrenaica, Arabia, Syria, and Mesopotamia; withdraw all forces from northern Persia and Transcaucasia; permit the occupation by the Allies of strategic points in Turkey and, if necessary to prevent disorder, of the Armenian villages; give the Allies free use of Turkish merchant shipping; demobilize most of the army; and surrender the fleet.

Austrian Collapse.—*Beginnings of Disintegration.*—Within the Austro-Hungarian Empire con-

ditions had steadily deteriorated since the beginning of the war. Even before the accession of Emperor Charles I on Nov. 21, 1916, the government had begun urging Germany to seek peace, and in 1917 in the Sixte affair it had sought ineffectually to bring about negotiations with the Allies. Only the Bolshevik Revolution and the treaties with Russia and the Ukraine prevented starvation and probably internal collapse in the winter of 1917-1918. When the summer of 1918 came and Ludendorff's desperate offensives in the west failed, the Austrian ruler and his ministers concluded that they would have to seek peace even if it meant acting independently of Germany. If they did not, they feared, the empire would simply disintegrate, for the various nationalities of which it was composed were already threatening to break away.

A Czech committee had issued a declaration of war against the empire on Nov. 14, 1915; the Czechoslovak National Council, headed by Tomáš Garrigue Masaryk, had been formed in 1916; Czech units had deserted en masse to fight with the Allies; representatives of the Czechs and Slovaks had met in congress at Pittsburgh, Pa., in 1918 to proclaim the formation of a Czechoslovak state; this state had quickly been recognized by the Allies; and the Czech and Slovak delegates in the Austrian Reichsrat practically demanded that independence be accorded them.

Nationalism had manifested itself ever more strongly since the outbreak of war. In November 1916, the Austrian and German governments had sought to appease the Poles by declaring their support of a united, autonomous Poland and creating a 25-man Council of State to exercise some governing power within the region, but this council had dissolved itself in 1917 when confronted with the refusal of the two powers to allow the creation of an independent Polish Army. A Polish National Committee in Paris, led by Roman Dmowski, won recognition from the Allies, which, on June 3, 1918, made Polish independence a war aim. Poles in the Reichsrat indicated that they too might support this committee.

In the south numerous local councils of Croats and Slovenes had endorsed a declaration issued at Corfu on July 20, 1917, in which representatives of these two groups had joined with Serbs in calling for creation of a united south Slav (Yugoslav) state. Separatist sentiment was growing in Hungary, and numbers of German Austrians were calling for the dissolution of the empire and the creation of a separate Austrian state.

Appeals for Peace.—After having failed in renewed efforts to obtain German agreement for a joint peace effort, the Austrian government on Sept. 14, 1918, dispatched a note through neutral capitals to all the belligerent governments, inviting them to send delegates for a meeting in some neutral state where there could be "a confidential and noncommittal exchange of views." This appeal was rejected almost instantly by the United States and soon afterward by Britain and France. The convening of the Reichsrat on Oct. 1, 1918, showed the government that its condition was desperate. All the nationality groups, including the German, issued declarations in favor of independence. On October 4, therefore, the Austro-Hungarian government dispatched a note to the United States requesting an armistice and offering to make peace on the

basis of the Fourteen Points and subsequent declarations by President Wilson, but the United States Department of State replied on October 18 that the president could no longer agree to mere autonomy for the nationalities within the empire.

Fragmentation of the Empire.—While officials in Vienna awaited this response and then anxiously meditated their reply to it, the Austro-Hungarian Empire fell apart. At Agram (now Zagreb) on Oct. 19, 1918, an assembly of Croats, Slovenes, and Serbs asserted its sovereignty over the south Slav portions of the Dual Monarchy, and most of the districts south of the Drava River accepted this decree. In Warsaw, on October 7, a three-man Regency Council, which had been installed late in 1917 as the successor to the disbanded Council of State, proclaimed Poland an independent state; on October 15, the Polish deputies in the Reichsrat declared themselves "subjects and citizens of the free and united Polish State"; and by October 31, the Austrian garrisons had been ousted from Polish Galicia. On October 16, Emperor Charles had made a last effort to regain the loyalty of these groups by offering to transform the monarchy into a federation of self-governing nations, but the Yugoslavs and the Poles rejected the proposal. From the United States, Masaryk proclaimed the independence of Czechoslovakia, and the Czechs in Prague held a bloodless revolution on October 28 and removed all officials of the old empire. A Hungarian National Council, which had taken office in Budapest on October 25, appealed to the emperor to release them from their vows of fealty, and he regretfully did so on November 1. Meanwhile, the German Austrian members of the Reichsrat had resolved in favor of independence for German Austria, and assemblies in Bucovina had announced the secession of that region and its adhesion to Rumania.

The Armistice.—Confronted with these dismaying events, the emperor and his officials abandoned all hope of negotiating for peace. On October 27, they offered to accept an armistice on almost any terms, and on November 3, at the Villa Giusti near Padua, their delegates signed an armistice providing for the immediate cessation of hostilities; demobilization of all Austro-Hungarian forces; evacuation of the Tirol, the Dalmatian coast, and the territory claimed by the Yugoslavs; surrender of all railway equipment and most of the fleet; and a grant to the Allies of power to move freely through the empire, occupy any part of it, and requisition supplies for their troops.

German Armistice.—In August 1918, when the Allied armies assumed the offensive in the west, the German High Command concluded that all hope of victory had disappeared. The state of morale on the home front had been revealed by the Reichstag peace resolution of July 1917 and, despite the termination of fighting in the east, by a wave of strikes in munitions plants in January 1918. Under the pressure of the Allied advance the morale of troops in the field began to crack. Consequently, in a conference held at Spa on September 29, General Ludendorff asked the civil officials of the government to arrange an armistice "without delay." By that time the Austrian government had issued its first appeal for peace, Bulgaria had sued for terms, and members of the Reichstag were calling for extensive changes in the German cabinet.

First Exchange of Notes.—Chancellor Georg von Hertling, who had succeeded Michaelis on Nov. 1, 1917, resigned almost as soon as the high command made its demand. His successor, Prince Max of Baden, was ordered by the kaiser to comply with the generals' wishes, and on Oct. 4, 1918, he dispatched through neutral channels a message to President Wilson, asking him "to take in hand the restoration of peace," and declaring that the German government accepted "as a basis for the peace negotiations" the Fourteen Points and others of Wilson's pronouncements. The American public, through its newspapers and spokesmen in Congress, greeted this message hostilely and called for "unconditional surrender," however, and the Allies advised Wilson that its aim was merely to divide Germany's enemies. Though Wilson decided not to dismiss it, as he had the Austrian appeal of September 14, he responded to it coolly, asking in a message of October 8 whether the German government would agree that his points and principles were to be the bases of peace so that negotiations would merely concern their application and, secondly, "whether the Imperial Chancellor is speaking merely for the constituted authorities of the Empire who have so far conducted the war."

Second Exchange of Notes.—This answer surprised the new chancellor. He was forming a cabinet representative of the majority parties in the Reichstag, and he had declared that it would be responsible to that body and not, as in the past, only to the kaiser. After conferring with military leaders and finding them little changed in their views, he and his advisers agreed that Wilson's questions should be answered in the affirmative. On October 12, therefore, the German Foreign Office replied that Germany "accepted the terms laid down by President Wilson in his address of January 8 and in his subsequent addresses as the foundations of a permanent peace of justice," and that the chancellor now spoke "in the name of the German Government and of the German people." This message, too, had a cold reception in the United States. Wilson, now under intense criticism both at home and abroad for entering into any negotiations at all, answered with four conditions: (1) the terms of the armistice were to be determined by the military advisers of the American and Allied governments; (2) no arrangement could be accepted "which does not provide absolutely satisfactory safeguards and guarantees of the maintenance of the present military supremacy of the armies of the United States and of the Allies in the field"; (3) submarine operations would have to cease immediately; and (4) the German government would have to show evidence that it had reformed its character.

Third Exchange of Notes.—This second American note was puzzling. The chancellor summoned a conference of the nation's principal civil and military officials to consider how it should be answered. He found to his astonishment that Ludendorff had changed his mind: the army could fight on, the general now said; an armistice on Wilson's terms was unnecessary and undesirable. The Admiralty opposed acquiescence to Wilson's third demand, but most of the civil ministers contended that the public desire for peace was so great and the state of civilian morale so low that the government could not break off negotiations. Endeavoring to effect a compromise among these wholly divergent

The Bettmann Archive

Troops of the victorious Allies parade under the Arc de Triomphe in Paris on Bastille Day, July 14, 1919.

opinions, Max drafted and dispatched to Washington on October 20 a note agreeing that "the conditions of an armistice should be left to the judgment of the military advisers, and that the actual standard of power on both sides in the field has to form the basis for arrangements safeguarding and guaranteeing this standard"; stating that submarine commanders had been ordered to stop attacking passenger vessels; and asserting that the German government was "free from arbitrary and irresponsible influence," and was "supported by the approval of the overwhelming majority of the German people."

Wilson replied on October 23 that, in view of the concessions made by the Germans, he could not decline to take up with the Allies the question of a possible armistice. But he went on to declare "that the only armistice he would feel justified in submitting for consideration would be one which should leave the United States and the powers associated with her in a position to enforce any arrangements that may be entered into and to make a renewal of hostilities on the part of Germany impossible." He also asserted harshly that he remained unconvinced that the German government represented the German people, and that if the United States "must deal with the military masters and the monarchical autocrats of Germany now, or if it is likely to have to deal with them later . . . , it must demand, not peace negotiations, but surrender."

German Collapse.—On October 27, the German government replied with a simple reaffirma-

tion that "far-reaching changes" had been made and were being made in the constitutional system, and that it awaited "proposals for an armistice which shall lead toward that peace of justice the President had outlined in his proclamations." In the meantime, however, the fabric of German society had begun to split. Reichstag leaders and newspaper editors called openly for the kaiser's abdication, and Prince Max secured the dismissal of Ludendorff. On November 3, units of the fleet began to mutiny, winning support from dock workers in the port cities. By November 8, revolution had spread throughout the Rhineland. King Louis III of Bavaria abdicated, and workers, soldiers, and peasants moved to set up a Soviet-style government. Hamburg fell to left-wing Socialists, and agitators there endeavored to organize forces for a march on Berlin. In the capital itself, Social Democrats demanded the creation of a republic, and on November 9 the leaders of the army informed the kaiser that they could no longer guarantee his safety. Striving to stay the mobs that were already parading in the streets of Berlin, Prince Max announced that the kaiser and his heirs renounced the throne. Though William never agreed to this act, he finally reconciled himself to the counsels of prudence and, on November 10, fled to the Netherlands.

Meanwhile, on November 5, the government had received Wilson's fourth and last note, stating that the United States and the Allies were prepared to receive a German delegation and

The Council of Four—Lloyd George, Orlando, Clemenceau, and Wilson—at Wilson's house in Paris, May 27, 1919.

communicate armistice terms to it. Max and his ministers selected Centrist leader Matthias Erzberger to head a four-man delegation, and it met on November 8 with Marshal Foch and other Allied officers in a railroad car on a siding at Compiègne. On November 9, the delegation accepted the terms offered them. Germany was to cease hostilities, and to evacuate France, Alsace-Lorraine, Belgium, and Luxembourg within 14 days from the signature of the armistice; the left bank of the Rhine and all territory on the right bank within a 30-kilometer radius of the principal crossings (Mainz, Coblenz, and Cologne) within 31 days; East Africa within an unspecified period; and lands previously belonging to Russia "as soon as the Allies, taking into account the internal situation of these territories, shall decide the time for this has come." Germany was also to surrender to the Allies a specified number of guns, airplanes, railroad cars, locomotives, trucks, and warships and all submarines. It was to renounce the treaties of Bucharest and Brest-Litovsk and agreements supplementary to them. In addition, it was to grant the Allies free access to its eastern regions and give them permission to requisition supplies for their forces, and it was to understand that the blockade would continue in force. Though protested by Hindenburg, these terms were accepted in Berlin, and early on the morning of November 11 the armistice agreement was signed by the delegations at Compiègne. The war was over at 11 A.M.

THE PEACE CONFERENCES AND PEACE TREATIES

Organization and Proceedings of the Conferences.—A conference among the victorious powers convened in Paris on Jan. 18, 1919. Each of the major belligerents (Britain, France, Italy, the United States, and Japan) was represented by a five-man delegation, assisted by varying numbers of experts and secretaries. The lesser belligerents had smaller delegations. All of these met periodically in plenary sessions of the conference, but the real power of decision was soon vested in a Supreme Council (Council of Ten) consisting of two representatives from each of the five great states, and later in a Council of Four, consisting of President Wilson, Prime Minister Lloyd George, Premier Georges Clemenceau of France, and Premier Vittorio Orlando of Italy. Numerous commissions were created to study special subjects, and these commissions

reported to the Supreme Council, which then approved recommendations to be put before the plenary sessions. The council also called in representatives of other belligerents, of neutral states, and of states in process of formation when questions affecting their interests were under discussion.

First Phase (Jan. 18–Feb. 14, 1919).

Through negotiations preceding the German armistice, President Wilson had won agreement from the Allies that the peace should be based on the points and principles which he had enunciated, the only exceptions being that "freedom of the seas" was to be left for later definition, and that Germany was to make compensation for the damage done to the civilian populations of the Allied states. His ideals had been hailed by spokesmen for public opinion in all the Allied nations. At the outset, at least, he was the dominant figure among the conferees, and he was able to insist that the first order of business should be the framing of a charter or Covenant for a League of Nations, and that this Covenant should be made an integral part of the treaties of peace. He himself took the chairmanship of the Commission on the League of Nations, which was to draft the Covenant and submit it to the conference, and he saw to it that no unrelated problem came to the point of decision before that work was finished.

Colonial Mandates.—It proved impossible, however, to frame the document without reaching some decision on the disposition of former German colonies, since Wilson took the position that, while these colonies could not be returned to Germany, they should not be treated as spoils of war, and their governance should be of primary concern to the proposed League. Representatives of Japan and the British Dominions opposed the president on this issue, for Japan desired the German Pacific islands north of the equator and the former German leasehold of Kiaochow in China, Australia wished to annex outright German New Guinea and the German islands south of the equator, and the Union of South Africa wanted similarly to take possession of German Southwest Africa. No meeting of minds seemed possible until Lt. Gen. Jan Christiaan Smuts of South Africa devised a compromise formula. He proposed that all the former German colonies be transferred to the League, but that the League assign a mandate for the governance of each one to some member state, and that these mandated territories be divided into three classifications: (A) those capable of eventual independence, in which the mandatory power would merely render "administrative advice and assistance"; (B) those, particularly in Central Africa, where the mandatory power would have to take responsibility for administration; and (C) "territories, such as Southwest Africa and certain of the South Pacific Islands, which, owing to the sparseness of their population, or their small size, or their remoteness from the centers of civilization, or their geographical contiguity to the territory of the Mandatory, and other circumstances, can best be administered under the laws of the Mandatory as integral portions of its territory." Though this last clause permitted virtual annexations by the Union of South Africa, Australia, and Japan, subject only to the requirement that they file an annual report with the League on conditions in the mandated territory, it proved acceptable to Wilson, who feared that the Dominions

and Japan might otherwise refuse to endorse the Covenant. Smuts' solution was approved.

See also **MANDATES SYSTEM**.

Covenant of the League.—No other serious problem arose during the first stage of negotiations. The French delegation did urge strongly that the projected international organization be equipped with a general staff and given additional power with which to enforce its decrees, but Wilson insisted that an organization which appeared to be a permanent military alliance would be unacceptable to the American public. The other members of the commission yielded to the president and eventually accepted a Covenant which closely resembled a draft that Wilson had initially put forward. It provided for an Assembly in which each member state, including self-governing Dominions and colonies, should have one vote; and a Council composed of representatives of the United States, Britain, France, Italy, and Japan, together with representatives of four other states, as chosen by the Assembly. The Council was to formulate plans for general disarmament and for the creation of a Permanent Court of International Justice; and, on reference from any member state, was to inquire into any situation threatening to cause a rupture between states, to report on the facts, and to make recommendations to the parties, the Assembly, or the member states. The agencies of the League, including a permanent Secretariat, were to register all treaties, and no treaty was to be binding unless it was so registered. They were also to exercise some control over traffic in arms and to endeavor to secure fair and humane conditions for labor.

The states joining the League were to promise that they would not resort to war with one another, and that, if a dispute proved insoluble by ordinary methods, they would submit it for arbitration or for investigation and recommendation by the Council. Most important of all, they were to pledge themselves to regard the security of any member as a matter of concern for all. Articles 10, 11, and 16 of the Covenant provided:

(10) The Members of the League undertake to respect and preserve as against external aggression the territorial integrity and existing political independence of all Members of the League. In case of any such aggression or in case of any threat or danger of such aggression the Council shall advise upon the means by which this obligation shall be fulfilled.

(11) Any war or threat of war, whether immediately affecting any of the Members of the League or not, is hereby declared a matter of concern to the whole League. . . .

(16) Should any Member of the League resort to war in disregard of its covenants. . . . it shall *ipso facto* be deemed to have committed an act of war against all other Members of the League. . . .

On Feb. 14, 1919, President Wilson presented the completed draft to a plenary session of the conference, declaring proudly, "a living thing is born." That evening he left for a short visit to his homeland.

Second Phase (Feb. 15–June 28, 1919).—**Amendments to the Covenant.**—In the United States, President Wilson discovered opposition to the Covenant already in flower. The opposition Republican Party had won control of both houses of Congress in the mid-term elections of 1918, and its leaders were critical of Wilson for having gone in person to Paris, for having included no conspicuous Republican or member of the Senate in the American delegation, and for having agreed to a Covenant that might conceivably allow League interference with American tariff

and immigration laws, abridge the Monroe Doctrine, or draw the United States into future European wars. On March 4, 1919, Senator Henry Cabot Lodge, the senior Republican on the Foreign Relations Committee, read into the *Congressional Record* a resolution declaring the Covenant "in the form now proposed" unacceptable. It was signed by 38 senators, or more than one third plus one which, under the United States Constitution, could prevent ratification of a treaty. By the time President Wilson returned to Paris on March 14, he and the other conferees knew that he would have to seek amendments to the original Covenant, and he quickly reconvened the Commission on the League of Nations and proposed new language that would specifically exclude tariff and immigration matters from the competence of the League, provide for a member state's voluntary withdrawal, and explicitly recognize the Monroe Doctrine.

In return for accepting these amendments, however, other delegations requested approval for other changes in the Covenant or asked for concessions by the president on economic or territorial issues. In the League of Nations Commission the French returned to their appeal for an international organization backed by permanent force. Although Wilson still could not yield to their view, he did give in to the extent of agreeing to sign with France and Britain a separate treaty of guaranty (June 28), under which the United States and Britain promised to come to France's aid if she suffered an unprovoked attack. (This treaty was never ratified in either Washington or London.) The Japanese asked that the president insert in the preamble to the Covenant phrases endorsing the principle of racial equality. Recognizing the difficulties that such phrases might cause in the British Dominions and in the United States, Wilson also had to refuse this demand. To mollify the Japanese and ensure that they accept the Covenant and join the League, however, he abandoned his opposition to their taking over the former German leasehold of Kiaochow as outright spoils of war, and contented himself with a promise that they would eventually return the territory to China. The French, the Japanese, and others then accepted his proposed amendments. The revised Covenant implicitly excluded tariff and immigration questions, provided that any state could withdraw from the League on two years' notice, and declared in a new Article 21: "Nothing in this Covenant shall be deemed to affect the validity of . . . regional understandings like the Monroe doctrine. . . ."

Reparations Issue.—While the League of Nations Commission resumed its sittings, the Council of Ten, succeeded by the Council of Four, turned to the framing of articles for the German peace treaty. One crucial issue which arose at once concerned the indemnities or reparations to be exacted from the vanquished. The French and British delegations obtained American acceptance of their view that the costs of the war should include such items as pensions to veterans and payments to the widows and children of the slain. The Commission on Reparations reported, however, that the resultant levies would far exceed anything that the defeated Germans could pay. The French took the position that the treaty should nevertheless contain such provisions. The British urged that the reparations be scaled down to a figure approxi-

making expert calculations of the maximum that Germany could afford, while the Americans argued for reducing the figure still further in order to permit some degree of German recovery. Finally, the Council of Four agreed on a compromise. A Reparation Commission would subsequently fix the sums that Germany was to pay; the treaty of peace itself would merely compel the Germans to accept responsibility "for causing all the loss and damage to which the Allied and Associated Governments and their nationals have been subjected as a consequence of the war imposed upon them by the aggression of Germany and her allies." Included in the final treaty as Article 231, this was to become known as the war guilt clause, and to be the subject of many German polemics during the 1920's and 1930's.

German Frontiers.—The French urged not only that heavy economic burdens be laid on Germany, but also that she be weakened as much as possible by losses of territory. They advocated the creation in the east of a large and strong Poland—"grande et forte, très forte," in the words of the French foreign minister, Stéphen J. M. Pichon. The British and the Americans, though committed to the creation of an independent Poland, were fearful lest new frontiers in the east create irredentist movements that would be sources of trouble in the future. They argued, therefore, for boundary lines that would more or less follow discoverable lines of nationality. The compromises finally reached gave the province of Posen (Poznań) to Poland and created the Polish Corridor west of the Vistula River, giving the new nation access to the Gulf of Danzig. Danzig (Gdańsk) itself, largely German in population, was made a free city. Plebiscites were ordered for the districts of Marienwerder (Kwidzyna) and Allenstein (Olsztyn); held in 1920, they returned these areas to Germany. A plebiscite was also ordained for Upper Silesia. Held in 1921, it resulted in a partition; the eastern third went to Poland, while the less industrialized western parts reverted to Germany.

In the west the French wished to detach from Germany the left bank of the Rhine, creating an independent buffer state or a permanently occupied zone. The British and the Americans opposed these proposals, just as they opposed those which might cause irredentist movements in the east. After a prolonged dispute, during which Clemenceau once accused Wilson of being pro-German and Wilson summoned his official ship, threatening to break up the conference and go home, the Council of Four arrived at a set of compromises. France was given full title to Alsace-Lorraine and also to the coal mines of the Saar, which were expected to compensate her for wartime losses. The area itself was for a period of 15 years to be governed by the League of Nations and occupied by Allied forces. At the end of that time a plebiscite was to determine its final disposition. In addition, the southern part of the Rhine Province, Birkenfeld, the Rhenish (Bavarian) Palatinate, and Mainz and its environs were also to be occupied for 15 years. Another zone, including the central sector of the Rhine Province and Coblenz and its environs, was to be occupied for 10 years. The northern part of the province and the Cologne region were to be occupied for 5 years. On the right bank of the Rhine, Germany was forbidden to construct any fortifications or to maintain armed forces within 50 kilometers of the river, and the

whole Rhineland was to be permanently demilitarized.

Fiume Issue.—Premier Orlando of Italy insisted that before the German treaty was concluded the Big Four should reach agreement on certain questions not connected with that treaty which were of concern to Italy. Specifically, he desired a promise from Wilson and the Allies that the provisions of the secret Treaty of London of 1915 would be executed, and that in addition Italy would be given the city of Fiume, which had a large Italian population but which was surrounded by Yugoslav territory and was expected to serve the new state of Yugoslavia as its primary Adriatic port. The British and French, who were parties to the London treaty, took the position that they would either stand by that document, which did not assign Fiume to Italy, or consider it null and void, examine the Italian claim to Fiume, and also re-examine the Italian treaty claims to the Tirol, the Trieste region, and the islands of the Adriatic coast.

Wilson, who had not signed the London treaty, took the position that all decisions should be based on considerations of nationality, with due regard to the economic and strategic interests of both the Italians and the Yugoslavs. After studying the issue, he concluded that Fiume should remain with Yugoslavia. He had already retreated from many of the principles he had announced during the war: he had acquiesced in punitive territorial and economic clauses for the German treaty, and he had yielded Kiaochow to the Japanese. On the Fiume issue, however, he proved immovable, and on April 24, 1919, Orlando and his colleagues angrily left Paris. The final provisions of the German treaty were therefore composed by a council of three—Wilson, Clemenceau, and Lloyd George.

The Peace Treaties.—**Treaty of Versailles.**—The completed treaty, containing 440 articles and covering 200 pages of text, was approved by a plenary session of the conference on May 6, 1919. In addition to incorporating the Covenant of the League and the financial and territorial provisions which had resulted from the debates among the Council of Four, the final text also stipulated that after March 31, 1920, the German Army should not consist of more than 100,000 officers and men, and that the Allies should have the right to try Germans guilty of violations of the laws of war and to arraign the kaiser before a special international tribunal "for a supreme offence against international morality and the sanctity of treaties."

Wilson and the Allies had originally conceived of the Paris meetings as merely a preliminary conference, assuming that it would be followed by a full-scale conference with the Germans. Partly because of the time which the preliminary conference took, partly because of the increasing internal disorganization in Germany itself, this plan was at some point abandoned. The Paris conferees agreed instead simply to submit the draft to a German delegation and give the German government a period in which to return written observations on it. This was done on May 7; the German commentary was submitted on May 29; all changes proposed by the Germans were formally rejected; when the Germans still delayed signing, the Allies made preparations for renewed military action; and on June 23, the German authorities declared that they were compelled to yield before this threat of force. On

une 28, in the Hall of Mirrors at Versailles, a German delegation finally endorsed the document.

See also VERSAILLES, TREATY OF.

Treaty of St.-Germain-en-Laye.—A treaty for Austria had meanwhile been drafted, and an Austrian delegation had been summoned to Paris to receive it. The same procedure was followed (as indeed it was with the other defeated states—Bulgaria, Hungary, and Turkey): written comments were received and answered by the Allied and Associated Powers. The only difference was that certain minor concessions resulted from these exchanges. The final treaty did not arraign the former Austrian emperor as a criminal, although it did call on Austria to deliver war criminals for trial. It specified financial reparations and reparations in kind, and required Austria to demobilize her forces and renounce compulsory military training. It also forbade Austria to unite with Germany, and it provided for the surrender by the Austrian government of all claim to territories which were to be transferred to Italy, Rumania, and the new Yugoslav, Czechoslovak, and Polish states. Austria thus gave up all lands beyond the historic frontiers of Bohemia, Moravia, and Slovakia, all claim to Bucovina, and all lands south of the Karawanken (Karavanke) Mountains and the Mur River. The treaty did provide, however, for a new frontier with Hungary in which Burgenland remained with Austria, and it allowed for plebiscites in the regions of Klagenfurt and Teschen. (The former, held in October 1920, gave the area to Austria; the latter was not held, but in July 1920 the Conference of Ambassadors, successor to the Supreme Council, divided the region between Czechoslovakia and Poland.) The Austrian delegation signed the treaty at St.-Germain-en-Laye on Sept. 10, 1919.

See also SAINT-GERMAIN, TREATY OF.

Treaty of Neuilly.—On Sept. 19, 1919, the Allied and Associated Powers presented a Bulgarian delegation with a draft treaty. In its final form it contained war crimes, reparations, and military clauses much like those in the Austrian treaty. It provided for a frontier between Bulgaria and Yugoslavia that generally favored the latter, and it required Bulgaria to surrender both Eastern and Western Thrace. The treaty was signed by the Bulgarian delegation at Neuilly-sur-Seine on Nov. 27, 1919.

See also NEUILLY, TREATY OF.

Treaty of Trianon.—The victors had planned to deal concurrently with the Austrians and with representatives of the newly independent Hungarian state, but revolutionary disturbances brought to power in Budapest a Communist regime headed by Béla Kun, and the conferees in Paris decided to wait before presenting a treaty to the Hungarians. On June 13, 1919, the Supreme Council simply sent a message to Béla Kun ordering him to withdraw Hungarian forces from the territories which by then had been assigned to Czechoslovakia and Rumania. Hungary was thus required to abandon the Pressburg (Bratislava) region, the Great Schütt, and Slovakia to the one, and Transylvania, part of the Hungarian plain, and part of the Banat to the other. When a Hungarian delegation was invited to Paris in November 1919, these new frontiers were formally provided for in the treaty presented to it, and it was asked to give up Burgenland to Austria, and Slavonia, northeast-

ern Croatia, and the remainder of the Banat to Yugoslavia. The war crimes, reparations, and military clauses were similar to those in the Austrian and Bulgarian treaties. The Hungarian delegation finally signed the treaty at Trianon on June 4, 1920.

See also TRIANON, TREATY OF.

Treaty of Sèvres.—Of all the treaties, the harshest was that imposed on Turkey and signed by a Turkish delegation at Sèvres on Aug. 10, 1920. Its war crimes, reparations, and military clauses were similar to those in the Austrian, Bulgarian, and Hungarian treaties, but the Sèvres agreements also provided that inter-Allied commissions should remain in Turkey to ensure the fulfillment of these clauses, to devise a new judicial system for the nation, and to regulate navigation in the straits. The straits were to be open as if they were international water. Turkey was to renounce all claim to Egypt, the Sudan, and Cyprus; acknowledge the Hejaz, Syria, Mesopotamia, and Armenia as free and independent states; and cede Thrace, Crete, and most of the Aegean Islands to Greece and the Dodecanese and Kastellorizo to Italy. Smyrna and its environs were to receive autonomy under administrative control by Greece, and a local assembly was to have the right after five years to apply for incorporation in the Kingdom of Greece. Similarly, Kurdistan was to have an autonomous regime arranged by an international commission, and it was to have the right to become independent upon application to the League of Nations. The Ottoman Empire was thus to be reduced to a fragment of Turkey proper. As it turned out, however, the Treaty of Sèvres was never put into force, and it was eventually replaced by the milder Treaty of Lausanne.

Treaty of Lausanne.—Turkish nationalists led by Mustafa Kemal refused to accept the Treaty of Sèvres, and their forces drove the Greeks from Smyrna and threatened the Allied position in the Dardanelles. The Allies therefore agreed to convene a new conference with the Turks, and a treaty was signed at Lausanne on July 24, 1923. Under its terms, Turkey recovered full administrative control of its own territory and regained sovereignty over part of eastern Thrace, including the city of Edirne, and over Smyrna, Kurdistan, and Armenia. Turkish possession of the Kars and Ardahan districts had been recognized by the Soviet Union in 1921. In return, Turkey agreed to demilitarize zones around the Bosphorus and the Dardanelles and an area on the Greek and Bulgarian borders in Thrace. A separate Straits Convention, signed at Lausanne on the same day, provided that the straits should remain open except in time of war, when Turkey could close them for her own defense or to enforce her neutrality.

Ratification of the Treaties.—**Nonratification by the United States.**—Despite the amendments which President Wilson had succeeded in introducing into the Covenant of the League of Nations, his Republican opponents were not assuaged. Republicans in the United States Senate were divided into three groups: one which opposed ratification of the German treaty in any form; one which wished the Senate to introduce serious amendments to the treaty or, in ratifying it, to state strong reservations about parts of it; and one which wished to enter less strong reser-

vations. These factions were known respectively as "irreconcilables," "strong reservationists," and "mild reservationists," and each had a small number of allies among senators from the President's own Democratic Party. Since the Senate Foreign Relations Committee had been so constructed that "irreconcilables" and "strong reservationists" formed a majority, it was able to delay presentation of the treaty to the Senate, and meanwhile public sentiment against the document grew. The treaty came to be opposed by many German Americans who felt that it was too harsh toward their fatherland, by Hungarian Americans who resented the settlement in the Balkans, by Italo-Americans angered by the Fiume dispute, by Sinophiles who regarded the Kiaochow clause as shameful, by liberal idealists disappointed that Wilson had compromised with so many of his points and principles, and by conservatives who feared that membership in the League might involve the United States in future economic or political difficulties.

To counteract the public swing against the treaty and to stimulate renewed enthusiasm for it, the president set out on a speaking tour of the country, but he collapsed at Pueblo, Colo., on Sept. 25, 1919, and shortly after his return to Washington suffered an incapacitating stroke. Many of his advisers concluded that there was little hope of ratification unless the Democrats compromised with the "mild reservationists," but Wilson, directing the battle from his sickbed, rejected all such suggestions. Thus when the treaty came up for a vote in the Senate on Nov. 19, 1919, Democrats insisted on ratification without reservations, and it failed of passage both when brought up in such form and when brought up with reservations attached. The same alignment holding, it failed a second time, on March 19, 1920.

The new Republican administration of Warren G. Harding, which took office in March 1921, negotiated a separate treaty of peace with Germany, signed at Berlin on Aug. 25, 1921; one with Austria, signed at Vienna on Aug. 24, 1921; and one with Hungary, signed at Budapest on Aug. 29, 1921. (The United States had not been at war with Bulgaria and Turkey.)

Ratification by Other Powers.—The treaties of Versailles, St. Germain, Neuilly, and Trianon had meanwhile been ratified by other signatories. The German treaty went into force on Jan. 10, 1920, and the League of Nations began functioning on Jan. 16, 1920. The Great War, as it was long called, thus officially came to a close.

16. The Postwar World

The armistices of 1918 and the treaties of 1919 and 1920 brought peace to only part of the world, for wars continued in eastern Europe, the Middle East, and Asia. In Russia civil conflict raged through 1919, and the Bolsheviks did not succeed in reconquering the Caucasus, the Ukraine, and the territory between Petrograd

(now Leningrad) and the Baltic Sea until early in 1920. In that year, they negotiated treaties recognizing the independence of Estonia, Latvia, Lithuania, and Finland. Meanwhile, however, the Polish government had come to the aid of the defeated Ukrainians, and war between Russia and Poland continued through the spring and summer of 1920. After suffering initial reverses, the Bolsheviks rallied and drove almost to the outskirts of Warsaw. The Poles, reinforced by French officers and money, then pushed them back. Peace negotiations opened in September 1920, and a treaty of peace delimiting the Soviet-Polish frontier was signed at Riga on March 18, 1921. In Hungary the Communist government of Béla Kun declared war on Rumania on April 22, 1919, only to have the Rumanians march toward Budapest, forcing Kun to flee the country on August 1. On March 1, 1920, a reactionary regency was established under Adm. Miklós (Nicholas) Horthy. In Albania a nationalist uprising early in 1920 compelled the Italians to withdraw their occupying forces and, on August 2, to recognize the nation's independence.

In Turkey, Mustafa Kemal (later Kemal Atatürk) battled from 1919 to 1922 to drive the Greeks from Smyrna (now Izmir) and to force the Allies to revise the Treaty of Sèvres. In Syria nationalists rose against the French, who had been assigned a mandate over the area by the inter-Allied Conference of San Remo of April 1920; much blood was shed before the French consolidated their control over Syria proper, and the Republic of Lebanon successfully proclaimed its independence (1926). In Iraq, which the Conference of San Remo had designated as a British mandate, there were uprisings in 1920. In Arabia there was fighting in 1919 between Ibn-Saud and King Husayn (Hussein) of the Hejaz, and it was not until 1925 that the former succeeded in consolidating his control over the entire peninsula. In Iran, which a treaty of Aug. 9, 1919, placed under British protection, a nationalist uprising was backed by the Soviet Union; it was only ended in February 1921 with the triumph of the British-backed military chieftain Reza Khan Pahlavi. The British treaty was denounced, and both Russians and British left the country. In Afghanistan, Emir Amanullah Khan declared war against the British in 1919, and peace was not fully restored until they recognized the complete independence of the nation in November 1921. In China civil war continued without interruption.

Nor did peace in the full sense of the term come even to western Europe. The new German Republic was tormented by insurrection in the Polish provinces in 1918 and 1919, by separatist movements in the Rhineland nurtured by the French occupying authorities, by an independent Communist republic established briefly in Bavaria in April 1919, and by the violent agitation of both Communist and right-wing nationalist groups elsewhere in the country. All of these difficulties were increased by the Allied blockade, which, continuing throughout the period of treaty making, brought much of the population to the point of starvation.

The Allies themselves, despite their hard bargaining at Paris, proved unable afterward to agree on the measures to be applied to Germany. A conference held at Spa in July 1920 determined the percentage of reparations which each of the victors should obtain from the defeated

state. Other conferences at Paris (January 1921) and London (February–March; April–May 1921) altered these percentages and fixed the payments in money and in kind that the Germans were to make. The French became increasingly irritated by the failure of the Germans to meet these obligations. They suggested repeatedly that the Allies invoke the sanctions provided in the Treaty of Versailles and occupy the Ruhr. The British opposed this suggestion and at conferences at London (December 1921) and Genoa (April 1922) proposed as partial compensation a new treaty guaranteeing the French frontiers. Nothing came of this proposal nor of further conferences at London (August and December 1922). Dissatisfied and alarmed by the fact that Germany and Russia had signed a treaty of commerce and friendship at Rapallo on April 16, 1922, the French defied the British and proceeded to occupy the Ruhr in January 1923.

The conferences which exacerbated disagreements were not, of course, the only ones held. A large assemblage of delegates met in Washington in the winter of 1921–1922 and framed a treaty of naval limitations which permitted cutbacks in capital ships by all the major maritime states; a nine-power pact providing for the maintenance of the open door for trade in China; and a four-power pact dissolving the 20-year-old Anglo-Japanese alliance and substituting for it an Anglo-American-Japanese-French compact providing for mutual consultation in the event of disturbances in the Pacific area. In 1922–1923 delegations at Lausanne framed a new Turkish treaty. For all practical purposes, however, tranquillity was not restored to Europe until 1925, when the French evacuated the Ruhr, and representatives of the major European states concluded the Locarno treaties, which included guarantees of the Franco-German and Belgogerman frontiers against aggression.

Political Consequences of the War.—The war and the peace treaties obviously wrought great changes in the political geography of Europe. Germany was reduced in size, while France and Italy were enlarged. There was a large independent Poland between Germany and Russia, and the Baltic states and Finland also became independent. Where the Austro-Hungarian Empire had been, there were Czechoslovakia, a tiny Austrian republic, an independent Hungary, a greater Rumania, and a united Yugoslav state. Most of the frontier lines in the Balkans were new, and so were those on post-1920 maps of the Middle East. In general, the boundaries of states followed more closely than ever the distinguishable lines of language and nationality, though there were significant minorities of Germans in Czechoslovakia and Poland and of Magyars in Czechoslovakia and Rumania.

In Europe, however, the geographical changes brought about by the war were probably less significant than the institutional changes. Where before the war there had been 19 monarchies and 3 republics, by 1922 there were 14 republics, 13 monarchies, and 2 regencies (Albania and Hungary). And, more important still, many of the postwar states, republics and monarchies alike, had adopted or were to adopt

ideologies quite different from those that had animated either republics or monarchies before the war. The revolutionary Marxism of the Bolsheviks triumphed in Russia. Socialists governed the Austrian Republic and, for a time, Germany, and Socialist parties made electoral gains in both Britain (1923) and France (1924). In Bulgaria, in 1919, Alexander Stamboliski and his Agrarian Party took power and established a dictatorship which gave primacy to the interests of peasants. In Italy, in October 1922, Benito Mussolini and his black-shirted Fascists seized control of the government and set up a regime that boasted of suppressing civil liberties and of subordinating the individual to the interests of the state. Government, whether in representative forms, as in France and Britain, or in totalitarian forms, as in Russia, Bulgaria, and Italy (and later in Nazi Germany), sought to be of and for, if not necessarily by, the masses. Except in Poland and Hungary, where old-fashioned regimes held sway, every nation in Europe adopted programs for land redistribution and enacted some kind of social service legislation. This formed a dramatic contrast with the past, when all but a few European governments had been avowedly of, for, and by a small minority. Nor was this transformation confined to Europe, for similar movements emerged in Mexico, Peru, India, and China.

See also FASCISM; MINORITIES; NATIONALISM AND INTERNATIONALISM; SOCIAL REFORM PROGRAMS AND MOVEMENTS—*Social Reform Programs, 1918 to 1956*; SOCIALISM—*Socialist Movements in Various Countries*.

Economic Consequences of the War.—The fighting in Europe destroyed many of the communications lines and factories of the Continent, but most of this physical damage proved relatively easy to repair. By 1922 the production of materials like coal, iron, and steel, the output of manufactures, and railroad mileage were all higher than in 1912, and despite tariff barriers raised by the new states intra-European commerce had also staged an almost complete recovery. Many changes had, of course, taken place. Industries were turning to mass production and, where possible, were using machines in place of human labor. Partly as a result of this but even more as a result of political changes, the work day was growing shorter. The eight-hour day, which had once seemed an impossible dream, became a reality. But neither mass production nor changes in working conditions nor even changes in consumer interests, such as the general passion in western Europe and the United States for new houses and motor cars, can be attributed to the war. Insofar as economic changes are traceable to that conflict, they lie rather in the realm of finance, for the war had one clear result: it transferred the center of wealth from Europe to North America.

The European victors were left owing their former ally an aggregate of \$10 billion; when the exchanges were freed in 1919, the British pound dropped by one fifth in value as compared with the dollar, while the franc fell by 50 percent. The effort made particularly by the French to wring reparations payments from Germany was due in part to a desire to recover lost ground. The Germans, when pressed, proved unable to pay. Inflation made the German mark worthless: it stood at 4.6 million to the dollar in August 1923, and at 4.2 trillion to the dollar

in November. An international committee, headed by Charles G. Dawes of the United States, recommended that a new financial system be adopted by the Germans and that reparations claimed by the Allies be scaled down, and this Dawes Plan was adopted in 1924. But the inflation wiped out savings, worked great hardship on the German middle classes, and helped to prepare the way for Adolf Hitler's seizure of power in 1933. And, to a lesser extent, financial disturbances worked hardships on the middle classes all over Europe and thus strengthened the tendency toward government of and for the masses.

Psychological Effects of the War.—If the war's economic consequences were narrower than contemporaries predicted, its psychological effects were profound and were quite different from what most people of the time foresaw. During the war politicians and publicists spoke of the great days to come, when there would be no more wars, no more armaments, no more clashes between nations, and no more want. The actuality of the harsh compromises in the treaties, coupled with continued violence in eastern Europe, the Balkans, the Middle East, and Asia, mutual distrust among the victors, and a sharp recession following the immediate postwar boom, produced a widespread sense of disillusionment. Some felt that the peacemakers had not been sufficiently idealistic; others, that they had been impractical. Still others concluded that the outcome of the war had proved all governments incapable of acting in the interest of common men or had proved man's fate to be something altogether beyond man's own control. From these various moods emerged an increasingly strong pacifist movement, violent nihilist movements like that of the Nazis in Germany, an escapism that gave great popularity to esoteric poets, novelists, and painters, and a brooding fatalism that found reflection in such writings as those of Oswald Spengler and Søren Kierkegaard.

World War I had been modern civilization's most hideous experience. In some parts of western Europe it had taken the life of one young man out of four, and in the generations that matured in the 1920's and 1930's few could understand for what reason it had been fought. The experience formed a trauma in the consciousness of most of the peoples who had taken part in it, and this fact is of cardinal importance for the understanding of the events that took place in the decades after it.

17. Chronology

A chronological outline of the more important events leading up to World War I, the principal occurrences during the course of the war, and postwar developments are presented under the following headings: (1) prelude to war, (2) declarations of war, (3) western front, (4) eastern front, (5) Italian front, (6) colonial and Japanese campaigns, (7) Turkish campaigns, (8) Balkan campaigns, (9) naval operations, (10) peace negotiations, and (11) postwar settlements.

PRELUDE TO WAR

1870

July 19—Franco-Prussian War begins.

Sept. 2—French surrender at Sedan.

Oct. 27—French surrender at Metz.

1871

Jan. 18—William I is proclaimed German emperor.

May 10—Treaty of Frankfurt; French lose Alsace and part of Lorraine; vow war of revenge.

1878

and Romania Dobruja; Bosnia and Herzegovina are placed under Austrian administration.

1879

Oct. 7—Austro-German alliance is formed.

1881

June 18—Three Emperors' League (Germany, Austria-Hungary, Russia) is formed; lasts until 1887.

1882

May 20—Germany, Austria-Hungary, and Italy form Triple Alliance.

1883

Feb. 4—German colonial expansion begins with note to Great Britain on South West Africa.

1887

June 18—Reinsurance Treaty between Russia and Germany replaces Three Emperors' League; lasts until 1890.

1890

July 1—Great Britain cedes Helgoland to Germany.

1894

Jan. 4—Franco-Russian alliance is completed.

Aug. 1—Sino-Japanese War begins.

1895

April 17—Treaty of Shimonoseki ends Sino-Japanese War after Chinese defeat.

May 8—Cession of Liaotung Peninsula to Japan is reversed in final Treaty of Shimonoseki as a result of intervention of the Great Powers, particularly Germany, who arouses Japanese enmity.

1899

May 18—First Hague Conference opens; ends July 29.

Oct. 11—South African (Boer) War begins; there is an outbreak of German Anglophobia.

1900

June 12—German Reichstag passes bill to double fleet.

1902

Jan. 30—Anglo-Japanese alliance is formed.

May 31—South African War ends with Boer defeat.

Nov. 1—Italy and France secretly agree that the former will remain neutral if the latter goes to war with Germany as a result of a German attack on Russia.

1904

Feb. 8—Russo-Japanese War begins.

April 8—Entente Cordiale is concluded by Great Britain and France.

1905

Schlieffen Plan is formulated for war against France. March 22—Emperor William II states at Bremen: "God has called us to civilize the world; we are the missionaries of human progress. . . . [We are] the salt of the earth."

March 31—Visit of William II to Tangier precipitates Moroccan crisis.

June 6—German pressure forces removal of French foreign minister, Théophile Delcassé.

Sept. 5—Treaty of Portsmouth ends Russo-Japanese War.

1906

Jan. 16—Algiers Conference on Morocco opens; ends April 7 with an agreement favoring French position, which was supported by Great Britain.

1907

June 15—Second Hague Conference opens; ends Oct. 18. Aug. 31—Anglo-Russian agreement completes Triple Entente.

1908

Oct. 5—Bulgaria becomes independent.

Oct. 6—Austria-Hungary proclaims annexation of Bosnia and Herzegovina. European crisis ensues; ends March 1909.

1909

August—German Chancellor Theobald von Bethmann-Hollweg makes overtures to secure British neutrality in the event of a Continental war.

© IMPERIAL WAR MUSEUM

The French rush troops of the Paris garrison to the Marne in September 1914.

Oct. 24—Italy and Russia conclude a secret agreement on Balkans and other areas.

1911

July 1—German gunboat at Agadir provokes a new Moroccan crisis.

July 15—Germany demands territorial compensation from France, including all of French Equatorial Africa and French preemptive rights to Belgian Congo.

July 21—A speech by David Lloyd George in London serves as a warning to Germany.

Nov. 4—France cedes two strips of French Equatorial Africa to Germany in return for recognition of its protectorate in Morocco.

1912

March—Germany endeavors to obtain an unconditional pledge of neutrality from Great Britain during any war into which Germany "might be forced." British offer a naval holiday, but a new bill is published that increases the German Navy.

May—June—Italy occupies the Dodecanese.

Oct. 5—First Balkan War begins.

1913

May 30—Treaty of London ends First Balkan War, Turkey cedes territory.

June 1—Greece agrees by treaty to send troops to Serbia if the latter is attacked by Bulgaria.

June 29—Second Balkan War begins; ends Aug. 10 with Treaty of Bucharest; Romania gains territory at expense of Bulgaria.

Aug. 7—Three-year military service bill is enacted in France.

Dec. 14—Gen. Otto Liman von Sanders arrives in Turkey as head of German military mission.

1914

June 28—Archduke Franz Ferdinand of Austria-Hungary and his wife are assassinated by a Serb at Sarajevo, Bosnia.

July 5—William II assures Austria-Hungary that he will support it and wage war against Russia and France if Russia aids Serbia.

July 7—Austro-Hungarian Council of Ministers decides to send Serbia a 48-hour ultimatum.

July 20—French President Raymond Poincaré and Premier René Viviani arrive in St. Petersburg; state visit ends July 23.

July 22—Germany warns Great Britain against outside interference between Austria-Hungary and Serbia.

July 23—Austria-Hungary sends its ultimatum to Serbia.

July 25—Conciliatory Serbian reply is rejected; Austria-Hungary breaks off relations with Serbia and orders partial mobilization.

July 26—Great Britain proposes a conference, proposal is rejected by Germany July 27.

July 28—Austria-Hungary and Serbia are at war.

July 29—Russia begins to mobilize.

July 31—Russia orders general mobilization, Germany proclaims state of the danger of war; Austria-Hungary orders general mobilization.

Aug. 1—Germany mobilizes.

Aug. 2—Germany sends ultimatum to Belgium; secret treaty between Germany and Turkey provides for subsequent entry of latter on side of Central Powers.

Aug. 3—Italy proclaims neutrality.

Aug. 4—Great Britain sends ultimatum to Germany.

DECLARATIONS OF WAR

1914

July 28—Austria-Hungary against Serbia.

Aug. 1—Germany against Russia.

Aug. 3—Germany against France.

Aug. 4—Great Britain against Germany at expiration of ultimatum at midnight; Germany against Belgium.

Aug. 5—Montenegro against Austria-Hungary.

Aug. 6—Austria-Hungary against Russia; Serbia against Germany.

Aug. 9—Montenegro against Germany; Austria-Hungary against Montenegro.

Aug. 12—Great Britain against Austria-Hungary.

Aug. 13—France against Austria-Hungary.

Aug. 22—Austria-Hungary against Belgium (received Aug. 28).

Aug. 23—Japan against Germany.

Aug. 25—Japan against Austria-Hungary.

Nov. 1—Russia against Turkey.

Nov. 2—Serbia against Turkey.

Nov. 5—Great Britain against Turkey; France against Turkey.

1915

May 23—Italy against Austria-Hungary.

June 3—San Marino against Austria-Hungary.

Aug. 21—Italy against Turkey.

Oct. 14—Bulgaria against Serbia.

Oct. 15—Great Britain against Bulgaria; Montenegro against Bulgaria.

Oct. 16—France against Bulgaria; Serbia against Bulgaria.

Oct. 19—Italy against Bulgaria; Russia against Bulgaria.

1916

March 9—Germany against Portugal.

March 15—Austria-Hungary against Portugal.

Aug. 27—Romania against Austria-Hungary; Italy against Germany (to take effect Aug. 28).

Aug. 28—Germany against Romania.

Aug. 30—Turkey against Romania.

Sept. 1—Bulgaria against Romania.

1917

April 6—United States against Germany.

April 7—Cuba against Germany; Panama against Germany.

July 2—Greece against Germany, Austria-Hungary, Turkey, and Bulgaria.

July 22—Siam against Germany and Austria-Hungary.

Aug. 4—Liberia against Germany.

Aug. 14—China against Germany and Austria-Hungary.

Oct. 26—Brazil against Germany.

Dec. 7—United States against Austria-Hungary.

Dec. 10—Panama against Austria-Hungary.

Dec. 16—Cuba against Austria-Hungary.

1918

April 23—Guatemala against Germany.

May 8—Nicaragua against Germany and Austria-Hungary.

May 23—Costa Rica against Germany.

July 12—Haiti against Germany.

July 19—Honduras against Germany.

BREAKING OF DIPLOMATIC RELATIONS

1917

Feb. 3—United States with Germany.

March 14—China with Germany.

April 8—Austria-Hungary with the United States.

April 10—Bulgaria with the United States.

April 13—Bolivia with Germany.

April 20—Turkey with the United States.

April 27—Guatemala with Germany.

May 17—Honduras with Germany.

May 19—Nicaragua with Germany.

Sept. 21—Costa Rica with Germany.

Oct. 6—Peru with Germany.

Oct. 7—Uruguay with Germany.

Dec. 7—Ecuador with Germany.

WESTERN FRONT

1914

Aug. 2—Germans invade Luxembourg.

Aug. 4—Germans invade Belgium.

Aug. 7—Germans enter Liège; French invade Alsace; British troops begin to land in France.

UPI/BETTMANN NEWSPHOTOS

Trench warfare begins as the Western Front is stabilized in October 1914 after the Battle of the Yser.

© IMPERIAL WAR MUSEUM

A British gun crew on the Somme in 1916 wears gas masks. The Germans introduced gas warfare in April 1915.

- Aug. 8—Belgian Army falls back; limited French success is achieved in Alsace.
- Aug. 9—French cavalry enters Belgium.
- Aug. 10—French advance in Lorraine.
- Aug. 20—Germans enter Brussels.
- Aug. 21—Reverses force French from Alsace-Lorraine.
- Aug. 22—French are defeated at Charleroi.
- Aug. 23—Namur falls to Germans; Battle of Mons begins.
- Aug. 24—British fall back from Mons; a general Allied retreat takes place.
- Aug. 25—Gen. Joseph Joffre orders troops from the west to build up Sixth Army near Paris.
- Aug. 26—Battle of Le Cateau; British are driven back.
- Aug. 27—Lille and Mézières are occupied by the Germans.
- Aug. 31—French Army falls back to line Aisne-Reims-Verdun.
- Sept. 1—Germans take Soissons.
- Sept. 2—Germans reach the Marne.
- Sept. 3—French government moves to Bordeaux.
- Sept. 5—Battle of the Marne begins.
- Sept. 6—French Sixth Army attacks German flank from west in Battle of the Ourcq, with modest success.
- Sept. 9—Marne battle ends; Germans begin retreat.
- Sept. 14—First Battle of the Aisne begins (ends Sept. 28); this is the introduction of trench warfare.
- Sept. 18—Stalemate on the Aisne, opponents begin series of attempts to outflank each other on the west, which develops into the Race for the Sea.
- Sept. 23—Germans take St.-Mihiel, forming salient.
- Oct. 9—Germans take Antwerp.
- Oct. 12—First Battle of Ypres begins (ends Nov. 11) as Germans try to break front; Allies hold.
- Oct. 16—Battle of the Yser ends race for the sea; neither side succeeds in outflanking the other; this is beginning of the stabilized front.

1915

- During the year the front remains essentially stabilized. There are local actions with few gains.
- Jan. 8—Battle of Soissons begins (ends Jan. 15); French drive is repulsed.
- Feb. 3—German attacks in Champagne are repulsed.

- March 10—Battle of Neuve-Chapelle; British achieve limited success in three-day battle.
- March 14—Battle of St.-Eloi begins (ends March 15); initial German gains are erased by British counterattacks.
- April 22—Second Battle of Ypres begins (ends May 24–25); costly and futile attacks are made by both sides; Germans introduce poison gas in war.
- May 9—Second Battle of Artois begins (ends June 18); French make small gains at heavy cost.
- May 15—Battle of Festubert begins (ends May 25); Allies obtain limited successes.
- June 20—German offensive in the Argonne begins (ends July 14); attempt to break French line fails.
- Sept. 25—Allied offensives begin at Loos and in Champagne (end Nov. 6); good initial successes are obtained; fighting is violent, however, and final gains are limited.

1916

- During the year only two major engagements take place, at Verdun and on the Somme, 38 air raids, mostly by zeppelins, are made over England.
- Feb. 21—Battle of Verdun begins; Germans attack to deplete limited French manpower.
- Feb. 25—Germans advance 3 miles (5 km) at Verdun; capture Fort Douaumont.
- March 16—Five German attacks are repulsed at Verdun.
- June 7—Germans take Fort de Vaux at Verdun.
- July 1—Franco-British offensive begins Battle of the Somme.
- July 3—Allies obtain local successes on the Somme.
- July 12—Battle of the Somme continues; British take Mametz Wood.
- July 14—British capture Trônes Wood; first phase of Battle of the Somme ends.
- July 17—British capture German second Somme defense line.
- Sept. 15—British introduce tanks in war on the Somme.
- Oct. 5—British and French have limited successes on the Somme.
- Oct. 13—Forty Allied bombers raid factory in Oberndorf.
- Nov. 13—Battle of the Ancre (part of Somme battle) begins (ends Nov. 18); British achieve success.

BETTMANN ARCHIVE/PG

British tanks move toward the front in 1916. The British were the first to use tanks, in September 1916 during the Battle of the Somme, but did not score a major success with them until late in 1917.

- Nov. 18—Battle of the Somme ends; there are 650,000 German, 420,000 British, and 195,000 French casualties.
 Dec. 12—Gen. Robert Georges Nivelle succeeds Joffre in command of the French.
 Dec. 15—Massive French attacks at Verdun make important gains.
 Dec. 18—Battle of Verdun ends; there are 550,000 French and 450,000 German casualties.

1917

- February—The Allies, now possessing superior manpower, plan offensive in Noyon salient.
 Feb. 23—Apprised of coming offensive, Germans begin withdrawal from salient to Hindenburg Line.
 March 18—Following up the German withdrawal, British occupy Péronne, and French Noyon.
 April 5—Germans complete withdrawal.
 April 6—United States enters war.
 April 9—Battle of Arras begins (ends May 3); Canadians capture Vimy Ridge.
 April 16—Second Battle of the Aisne (ends May 9); Nivelle hurls French against impregnable defenses with staggering losses; French troops mutiny.
 May 3—British break Quéant position; move on Cambrai.
 May 4—French take Craonne and Chemin des Dames on the Aisne.
 May 15—Gen. Philippe Pétain replaces Nivelle in command of the French.
 June 7—Battle of Messines begins (ends June 8); British capture ridge.

Led by Gen. John J. Pershing (hand on sword), the first American fighting contingent lands in France in 1917.

BETTMANN ARCHIVE

French shock troops with tank support prepare to go over the top. Tanks could overrun trenches.

- April 9—Lys offensive begins; second German drive, designed to shatter British, wins 10 miles (16 km); it is stopped April 29 by lack of reserves and Allied counterattacks, and Germans are left in salient.
 April 14—Gen. Ferdinand Foch is appointed supreme Allied commander.
 May 27—Aisne offensive (third German drive), designed to break French, reaches Marne in four days.
 May 28—Battle of Cantigny; in first independent American operation, 1st Division captures Cantigny.
 June 2—French hold on the Marne; Americans stop German crossings of the river at Château-Thierry.
 June 6—Aisne offensive ends; Germans are left in salient.
 June 9—Noyon-Montdidier offensive begins; the fourth German drive, it is designed to threaten Paris. French hold with new defensive system, and drive ends June 13.
 July 15—Champagne-Marne offensive (Second Battle of the Marne) begins (ends July 17), the last German drive, it is stopped by the French.
 July 18—Foch begins to reduce German salients prior to launching general attack; Aisne-Marne offensive against Marne salient begins; 8 American divisions participate.
 July 27—Germans in Marne salient are in general retreat.

- June 25—First American fighting troops land in France.
 July 31—Third Battle of Ypres begins; British continue attacks until Nov. 6 to occupy Germans while French recuperate from Aisne debacle; there are tremendous casualties but meager successes.
 Aug. 20—French make limited gains near Verdun.
 Nov. 6—Canadians capture Passchendaele Ridge; Third Battle of Ypres ends.
 Nov. 9—Allies form Supreme War Council.
 Nov. 20—Battle of Cambrai begins (ends Dec. 3); British first massed tank attack surprises Germans and breaks line; lack of reserves limits British success.
 Nov. 30—Germans counterattack at Cambrai (attack ends Dec. 1).
 Dec. 4—British withdraw at Cambrai, losing much ground (withdrawal ends Dec. 7).

1918

- Collapse of Russia permits transfer of German troops to west, giving the Germans numerical superiority; they plan supreme effort to win in France before United States can intervene.
 March 21—Somme offensive begins; the first German drive to split French and British, it achieves substantial initial gains.

Aug. 6—General British attack begins; troops land at Suvla Bay.

Aug. 9—British are pinned down in all sectors.

Aug. 15—A renewed British attack fails.

Aug. 21—Another attack fails.

Dec. 20—British troops are evacuated from Anzac and Suvla Bay.

1916

Jan. 9—British troops are evacuated from Helles; campaign ends in complete failure.

Mesopotamia

1914

Nov. 7—British land in Mesopotamia opposite Abadan.

Nov. 22—British occupy Basra.

Dec. 9—British move north to Al Qurna.

1915

April 12—Turks attack British at Basra; attack fails, and they flee April 14.

May 16—British occupy Ahwaz to protect oil pipeline.

June 3—British capture Amara on the Tigris.

July 25—British capture Nasirya on the Euphrates.

Sept. 22—British advance on Kut begins.

Sept. 28—British rout Turks at Sannaiyat and enter Kut.

Oct. 5—British reach Al Aziziya.

Nov. 11—British start north for Baghdad.

Nov. 22—British attack Turks at Ctesiphon; capture front line.

Nov. 25—Turks hold firm; British withdraw southward.

Dec. 3—British halt retreat at Kut.

Dec. 7—Turks surround British in Kut.

Three wounded Turks are brought in by British soldiers during the Allies' futile Gallipoli campaign of 1915.

BETTMANN ARCHIVE

Arabs take to their camels against Turkish forces in the Hejaz after revolting against the sultan in 1916.

1916

Jan. 21—First British attempt to relieve Kut fails.
 March 8—Second British attempt is beaten back.
 April 22—Third British attempt fails.
 April 29—British garrison at Kut surrenders.
 Dec. 13—British advance toward Kut.

1917

Feb. 24—British force Turkish retreat; reoccupy Kut Feb. 25.
 March 5—British advance toward Baghdad.
 March 11—Turks evacuate Baghdad; British occupy city.
 Sept. 29—British occupy Ramadi on the Euphrates.
 Dec. 9—Turks are driven from Khanaqin.

1918

March 9—British capture Hit.
 Oct. 23—British begin advance to Mosul.
 Oct. 30—Turks are surrounded and captured at Sharqat; armistice is declared, effective Oct. 31.

Egypt and Palestine

1914

Dec. 18—British proclaim protectorate over Egypt.

1915

February—Turkish attempts to capture Suez Canal are repulsed.

1916

June 5—Hussein Ibn Ali, sharif of Mecca, proclaims Arab revolt against Turks.
 Aug. 4–5—Turks are badly beaten at El Rumana, British start advance to Palestine border.
 Dec. 21—British advance to El Arish.

1917

January—British arrive at Palestine border.
 March 26—First Battle of Gaza begins (ends March 27); British attack Turks but are repulsed.
 April 17—Second Battle of Gaza begins (ends April 19); British attacks are again repulsed.
 Oct. 31—Third Battle of Gaza begins (ends Nov. 7); Turks are outflanked and forced to withdraw.
 Nov. 13—Battle of Junction Station begins (ends Nov. 14); Turks are defeated.
 Dec. 9—British capture Jerusalem.

1918

April—Five British divisions are transferred to western front and are replaced by Indian troops.
 Sept. 19—Battle of Megiddo takes place; Turks are put to flight.
 Oct. 1—British take Damascus.
 Oct. 26—British take Aleppo.
 Oct. 30—Armistice is declared, effective Oct. 31.

Caucasus

1914

Dec. 29—Turks, advancing on Kars, are badly defeated by Russians near Sarikamis in battle ending Jan. 2, 1915.

1915

Russians push back Turks north of Lake Van.

1916

Jan. 17—Russian offensive on Lake Van-Black Sea front begins.

Feb. 12–16—Erzurum, Turkey, falls to Russians.
 April 17—Russians capture Trebizond.
 July 25—Russians capture Erzincan; advance bogs down; front is stabilized for rest of the year.

1917

March 12—Russian Revolution begins; Caucasus troops remain loyal.
 Allies to Caucasus army are cut off.
 Troops begin to abandon front and return to Russia.

1918

Feb. 18—Turks begin advance to Baku oilfields.
 Feb. 24—Turks reoccupy Trebizond.
 March 12—Turks reoccupy Erzurum.
 April 15—Turks reach Batumi.
 April 27—Turks capture Kars.
 May–June—Armenians and Georgians oppose Turkish advance; Germans and Turks clash at Tbilisi.
 Aug. 4—British detachment reaches Baku.
 Sept. 14—Turks force British to evacuate Baku.
 Oct. 30—Armistice is declared, effective Oct. 31.

BALKAN CAMPAIGNS

1914

July 29—Austrians bombard Belgrade; Serbs evacuate city.
 Aug. 7—Serbs enter Bosnia.
 Aug. 12—Austrians cross Drina River in first invasion of Serbia.
 Aug. 16—Battle of the Jadar begins (ends Aug. 19); Austrians are defeated.
 Aug. 20—Austrians retreat back across border.
 Sept. 8—Second Austrian invasion begins; it makes little progress.
 Sept. 16—Invasion is halted; Austrians regain bridgeheads.
 Sept. 23—Serbs and Montenegrins approach Sarajevo.
 Oct. 4—Advance is turned back in Sarajevo area.
 Nov. 5—Albanian invasion of Montenegro is checked; Austrians begin third invasion of Serbia.
 Nov. 11—Serbs are forced back from borders.
 Nov. 15—Austrians capture Valjevo.
 Nov. 29—Serbs evacuate Belgrade; Austrians occupy city Dec. 2.
 Dec. 3—Serbian armies counterattack all along front.
 Dec. 8—Austrians are defeated in Battle of the Rudnik Ridges.
 Dec. 9—Austrians begin retreat.
 Dec. 15—Austrians are driven from Serbia; invasion ends.

1915

Feb. 2—Montenegrins repulse Austrians in Hercegovina.
 Aug. 16—Austrian attack on Montenegrin border is repulsed.
 Sept. 6—Secret alliance is concluded by Bulgaria, Germany, and Austria-Hungary.
 Sept. 22—Treaty whereby Turkey cedes territory to Bulgaria is ratified.
 Oct. 1—Austro-German forces concentrate on Serbian border.
 Oct. 3—Bulgarians mass on Serbian border; Anglo-French forces begin to land at Salonika, Greece.
 Oct. 7—Austrians and Germans invade Serbia.
 Oct. 9—Austrians occupy Belgrade.

Austrian gunners fire on a Serbian position in August 1914. The initial Austrian attacks were unsuccessful.

BETTMANN ARCHIVE

BETTMANN ARCHIVE

Britain's Grand Fleet patrols the North Sea. Churchill ordered it to its war base before Germany mobilized.

1915

Jan. 24—Naval battle takes place in North Sea.
Feb. 4—Germans declare war zone around Great Britain; effective Feb. 18.
Feb. 10—United States protests German war zone.
Feb. 19—British bombard outer Dardanelles forts.
Feb. 25—Bombardment of Dardanelles forts is renewed.
March 1—Allies establish undeclared blockade of Central Powers.
March 4—Major naval attack on Dardanelles begins.
March 18—Dardanelles attack fails, 3 British and French warships are sunk.
May 13—First United States note to Germany protests sinking of *Lusitania* on May 7 with loss of 128 American lives.
Aug. 16—Russo-German action occurs in Gulf of Riga.
Aug. 20—Russians defeat German landing operations on Gulf of Riga.
Aug. 21—Germans evacuate Gulf of Riga.
Aug. 23—Allied fleet bombards Zeebrugge.
Sept. 6—Allied fleet bombards Ostend.
Oct. 5—German government promises to avoid attacking passenger vessels.
Oct. 21—British bombard Bulgarian Aegean coast, United States protests undeclared Allied blockade.

1916

Jan. 18—Bulgarian coast is bombarded by Allies.
Feb. 6—Austro-Italian action occurs in Adriatic.
March 25—British destroyers and seaplanes raid zeppelin sheds in Schleswig.

Inside a cramped U boat. Unrestricted submarine warfare was Germany's answer to the Allied naval blockade.

Curious Britons examine a U boat stranded on a beach in southern England after Germany's surrender in 1918.

- March 31—British warship bombards Smyrna.
- April 18—United States demands assurances that Germans will not sink ships without warning.
- April 20—German auxiliary cruiser and submarine attempt to land arms in Ireland; cruiser is sunk.
- April 25—German squadron and zeppelins raid Lowestoft and Yarmouth.
- May 4—Germany replies to United States that it has ordered submarine commanders to suspend operations against merchant shipping.
- May 31—Battle of Jutland begins between major British and German forces, ends June 1 in drawn battle.
- Oct. 26—German destroyer attack is made in English Channel.
- Nov. 4—Russian fleet bombards Constanta, Romania.
- Nov. 10—Germans shell Baltic port near Tallinn, 6 to 9 destroyers are sunk by Russians.
- Nov. 26—German naval raid is made on Lowestoft.

1917

- Jan. 23—German destroyers engage light British force off Netherlands.
- Jan. 31—Germany announces resumption of unrestricted submarine warfare, effective Feb. 1.
- Feb. 25—German destroyers bombard Broadstairs and Margate, England.
- April 20—Six German destroyers raid Dover; 3 are sunk.
- April 26—German naval raid is made on Ramsgate, England.
- May 10—Eleven German destroyers sally from Zeebrugge, Belgium, but are forced back by British.
- May 12—British air and naval bombardment is made on Zeebrugge.
- Oct. 17—Two British destroyers and 9 escorted ships are sunk off Shetland Islands by 2 German raiders.
- Nov. 17—Light cruiser fight occurs off Helgoland.

1918

- April 22–23—British naval raids are made on Zeebrugge and Ostend, blocking Bruges Canal and Ostend harbor.
- May 9–10—British again raid Ostend.
- July 7—British naval air forces bombard Constantinople.
- July 19—United States cruiser is sunk by torpedo off Fire Island, N.Y.
- Nov. 3—German sailors begin to mutiny.
- Nov. 21—German High Seas Fleet surrenders to British.

1919

- June 21—German crews sink most of the German fleet at Scapa Flow.

PEACE NEGOTIATIONS

1916

- Feb. 22—Col. Edward M. House, President Woodrow Wilson's representative, and British Foreign Secretary Sir Edward Grey initial agreement on peace terms (never effected).
- Dec. 12—Germany calls for peace negotiations.
- Dec. 18—President Wilson sends note to all belligerents, asking them to inform him confidentially of terms they would accept.
- Dec. 26—In reply, Central Powers tell Wilson that any discussion should be held among belligerents.

1917

- Jan. 10—Allies, in notes to Wilson, offer relatively mild terms.
- Jan. 22—President Wilson calls on both sides to accept "a peace without victory."
- February–May—Prince Sixte of Bourbon undertakes inconclusive peace talks with Austrp-Hungarian government.
- July 19—German Reichstag adopts peace resolution.
- Aug. 1—Pope Benedict XV appeals to all belligerents to accept compromise peace.
- Aug. 27—President Wilson stresses moral objections to negotiations with aggressive governments.
- September—Germans refuse to give pope guarantee on restoration of Belgium; negotiations lapse.
- Dec. 3—German-Russian armistice negotiations open at Brest-Litovsk.

1918

- Jan. 5—British Prime Minister David Lloyd George says Allies are fighting for just and lasting peace.
- Jan. 8—President Wilson presents Fourteen Points.
- Feb. 9—Central Powers and Ukraine sign peace treaty at Brest-Litovsk.
- Feb. 18—German-Russian armistice is terminated after Leon Trotsky refuses to sign peace treaty and unilaterally proclaims peace.
- March 3—Bolsheviks sign Treaty of Brest-Litovsk, ceding much Russian territory, and agree to evacuate Finland.
- Aug. 27—Russia signs treaty in Berlin, renouncing claims to Estonia and Livonia.
- Sept. 14—Austria-Hungary sends note to belligerents, requesting exchange of views; it is rejected.
- Sept. 29—Bulgaria signs armistice; Gen. Erich F. W. Ludendorff asks that armistice be arranged on western front without delay.
- Oct. 4—Austria-Hungary sends note to United States, requesting armistice on basis of Fourteen Points (including autonomy for peoples of empire); Germany, in similar note, also accepts Fourteen Points.
- Oct. 7—Council of Regency in Warsaw proclaims Poland an independent state.
- Oct. 8—President Wilson, replying to German note, questions whether it speaks merely for authorities that had thus far conducted the war.
- Oct. 12—German note states that it speaks for government and people; in reply, President Wilson sets four conditions for armistice.
- Oct. 14—Turks appeal for armistice.
- Oct. 18—United States informs Austria-Hungary that autonomy is no longer a sufficient basis for peace.
- Oct. 19—Serbs, Croats, and Slovenes assert sovereignty over South Slav portions of Dual Monarchy.
- Oct. 20—German note makes further concessions.
- Oct. 23—President Wilson agrees to take up question of German armistice with Allies.
- Oct. 27—Austria-Hungary offers to accept armistice on almost any terms; Germany advises United States that it awaits armistice proposals.
- Oct. 28—Czechs remove imperial officials in Prague.
- Oct. 30—Turks sign armistice, effective Oct. 31.
- Nov. 1—Emperor Charles I releases Hungarians from vows of fealty.

The artillery piece "Calamity Jane" fired the last shot of the war for the United States on Nov. 11, 1918.

BETTMANN ARCHIVE

CAMERA PRESS

The historic Belgian town of Ypres lies in ruins in 1919. The Allies imposed war reparations on Germany.

- Nov. 3—Austrians sign armistice at Villa Giusti, effective Nov. 4.
- Nov. 5—German government receives President Wilson's fourth note, stating that Allies are prepared to receive German delegates.
- Nov. 9—Chancellor Prince Max of Baden announces that William II and his heirs have renounced German throne; Germany accepts Allies' armistice terms, agreeing to cease hostilities and to evacuate France, Alsace-Lorraine, Belgium, and Luxembourg in 14 days from signature of armistice, and left bank of Rhine and bridgeheads at Mainz, Koblenz, and Cologne in 31 days.
- Nov. 11—Germans sign armistice at Compiègne.

1919

- Jan. 18—Peace conference opens in Paris.
- Feb. 14—Draft Covenant of League of Nations is completed, President Wilson, chief United States delegate, returns to United States to secure support.

American troops home for demobilization greet the Statue of Liberty on arriving in New York in 1919.

UPI/BETTMANN NEWS PHOTOS

- March 4—Thirty-eight United States senators find Covenant unacceptable.
- March 14—President Wilson returns to Paris and begins work to secure revision of Covenant.
- April 24—Italian Premier Vittorio Orlando leaves conference over Fiume issue.
- May 6—Peace conference delegates approve treaty providing for German cessions of territory (Alsace-Lorraine to France, Polish Corridor to Poland, plebiscites elsewhere) and reparations, creation of mandates from former German colonies, occupation of Rhineland, and limitations on German Army.
- May 7—German delegates receive peace terms.
- May 29—Germans present commentary on treaty; proposed changes are rejected by Allies.
- June 28—Allied and German delegates sign treaty of Versailles; United States, Great Britain, and France sign treaty of guaranty.
- Sept. 10—Allied and Austrian delegates sign Treaty of St. Germain-en-Laye; Austria relinquishes claims to territory to be transferred to Italy, Yugoslavia, Czechoslovakia, Romania, and Poland.
- Nov. 19—Treaty of Versailles fails of ratification in United States Senate.
- Nov. 27—Allied and Bulgarian delegates sign Treaty of Neuilly; Yugoslavia and Greece receive territory at Bulgarian expense.

1920

- Jan. 10—Treaty of Versailles is in effect.
- March 19—Treaty of Versailles fails of ratification in United States Senate.
- June 4—Hungarian and Allied delegates sign Treaty of Trianon; Hungary cedes territory to Austria, Czechoslovakia, Romania, and Yugoslavia.
- Aug. 10—Turkish and Allied delegates sign Treaty of Sèvres, because of its harsh terms, it is not ratified by Turks.

1921

- Aug. 24—United States signs a separate treaty of peace with Austria at Vienna.
- Aug. 25—United States signs a separate treaty of peace with Germany at Berlin.
- Aug. 29—United States signs a separate treaty of peace with Hungary at Budapest.

1923

- July 24—Allies and Turkey sign Treaty of Lausanne, Turks regain part of eastern Thrace.

POSTWAR SETTLEMENTS

1919

- May 14—War breaks out between Greece and Turkey.
- Aug. 9—Treaty places Persia under British protection.

1920

- Jan. 16—League of Nations begins functioning.
- Feb. 2—Treaty of Tartu recognizes independence of Estonia.
- April 25—War breaks out between Poland and Russia, ends Oct. 12 with preliminary Treaty of Riga.
- July 5—Reparations conference opens at Spa (ends July 16), protocol apportioning reparations is signed.
- July 12—Treaty of Moscow recognizes independence of Lithuania.
- July 28—Teschen is divided between Czechoslovakia and Poland.
- Aug. 2—Italy recognizes independence of Albania.
- Aug. 11—Treaty of Riga recognizes independence of Latvia.
- Oct. 10—Plebiscite in Klagenfurt area results in its retention by Austria.
- Oct. 14—Treaty of Tartu recognizes independence of Finland.
- Nov. 12—Under terms of Treaty of Rapallo between Italy and Yugoslavia, Fiume becomes independent city.

1921

- Feb. 21—Reza Khan Pahlavi triumphs in Persia; British 1919 treaty is denounced Feb. 27.
- March 16—Turkish possession of districts of Kars and Ardahan is recognized by USSR.
- March 18—Definitive Treaty of Riga delimits Soviet-Polish frontier.
- March 20—Plebiscite in Upper Silesia results in its partition between Poland and Germany.
- Nov. 12—Washington Conference on disarmament opens, closes Feb. 6, 1922.

1922

- April 16—Treaty of Rapallo is signed by Germany and USSR.
- Oct. 13—War between Greece and Turkey ends.
- Oct. 28—Fascists come to power in Italy.

1923

- Jan. 11—Because of German delay in reparations payments, French and Belgian troops begin to occupy the Ruhr.
- July 24—Straits Convention is signed.

1924

Jan. 27—Yugoslavia agrees to cession of Fiume to Italy.
 April 9—Dawes Plan on reparations is presented.
 July 16—London Conference on reparations opens (ends Aug. 16); adopts Dawes Plan.

1925

Aug. 25—French and Belgian troops leave the Ruhr.
 Dec. 1—Locarno treaties, guaranteeing Franco-German and Belgo-German frontiers against aggression, are signed in London.

VINCENT J. ESPOSITO,
Colonel, United States Army;
Head, Department of Military Art,
United States Military Academy.

18. Costs of the War

War cost are of two kinds—direct and indirect. Direct costs embrace all expenditures made by belligerents in carrying on hostilities. Indirect costs include the economic losses resulting from deaths attributable directly or indirectly to the war, the value of property damaged or destroyed, the loss of production arising from the transfer of civilians to military pursuits, expenditures from war relief work, the cost of war to neutral nations, and the like. The direct costs of World War I, based on the most reliable statistics, were \$186,333,637,000; the indirect costs have been estimated at \$151,646,942,560, making the total war bill \$337,980,579,560. It has been possible to appraise the direct costs fairly accurately, but the indirect costs can only be estimated, for there is no unit of measurement by which they may be definitely fixed. Notwithstanding the many figures purporting to show how much money was spent to carry on the war, the fact is that it was fought mainly on credit, since the gold available at the outbreak of hostilities was not sufficient to have kept it going for more than 40 or 50 days. During the first three years of the war the average daily cost was \$123 million, and in 1918 it rose to \$225 million.

Direct War Costs.—Table 1 shows the net direct costs of the war to the belligerents. It allows credit for territory, shipping, and other material gains by the victors, and assumes full repayment of loans and collection of indemnities.

Table 1—DIRECT COSTS OF THE WAR

Countries	Cost
Allied and Associated Powers:	
United States	\$ 22,625,253,000
Great Britain	35,334,012,000
British Dominions and Colonies:	
Canada	1,665,576,000
Australia	1,423,208,000
New Zealand	378,750,000
India	601,279,000
Union of South Africa	300,000,000
Colonies	125,000,000
France	24,265,583,000
Russia	22,593,950,000
Italy	12,413,998,000
Belgium	1,154,468,000
Romania	1,600,000,000
Japan	40,000,000
Serbia	399,400,000
Greece	270,000,000
Other Allied countries	500,000,000
Total	\$125,690,477,000
Central Powers:	
Germany	\$37,775,000,000
Austria-Hungary	20,622,960,000
Turkey	1,430,000,000
Bulgaria	815,200,000
Total	\$ 60,643,160,000
Grand Total	\$186,333,637,000

Indirect War Costs.—Loss of Human Life.—The average social value of an individual in the six leading belligerents at the time of the war has been estimated as follows: United States, \$4,720; Great Britain, \$4,140; Germany, \$3,380; France, \$2,900; Austria-Hungary, \$2,750; and Russia, \$2,020. Table 2 has been developed on the basis of these values and appropriate assumptions for the other belligerents.

Table 2—CAPITALIZED VALUE OF LOSS OF LIFE

Countries	Lives Lost ¹	Value
United States	109,740	\$ 517,972,800
Great Britain	839,904	3,477,202,560
Germany	1,997,365	6,751,093,700
France	1,654,550	4,798,195,000
Austria-Hungary	1,132,500	3,114,375,000
Russia	4,012,064	8,104,369,280
Belgium	272,000	788,800,000
Italy	1,180,660	2,397,053,200
Serbia ²	757,343	1,529,832,860
Romania	397,117	802,176,340
Greece	37,500	75,750,000
Portugal	4,100	8,282,000
Japan	301	608,020
Turkey	488,789	987,353,780
Bulgaria	106,637	215,406,740
Total, armed forces	12,990,570	\$33,568,471,280
Estimated loss resulting from civilian deaths ³		33,568,471,280
Total valuation of lives lost		\$67,136,942,560

¹Assumes that approximately half of those listed as missing or prisoners of war actually died. ²The figure of 757,343 lives lost by Serbia in this compilation is undoubtedly in error, for Serbia mobilized a total of only 707,343 men; a more valid figure would be 121,500. ³Such deaths are supposed to equal the number of those in the armed forces.

Property Losses.—Estimating losses caused by destruction and damage to property in war is an exceedingly difficult task. One estimate, used in Tables 3 and 4, places total property losses in World War I at \$36,760 million, of which \$29,960 million was sustained on land and \$6,800 million at sea. The merchant vessels sunk, aggregating 15,398,392 gross tons, represent a loss of \$3,000 million, and their cargoes were valued at \$3,800 million.

Table 3—PROPERTY LOSSES ON LAND

Countries or areas	Value
Belgium	\$ 7,000,000,000
France	10,000,000,000
Russia (except for the Ukraine)	1,250,000,000
Poland	1,500,000,000
Serbia, Albania, and Montenegro	2,000,000,000
East Prussia, Austria, and the Ukraine	1,000,000,000
Italy	2,710,000,000
Romania	1,000,000,000
British Empire	1,750,000,000
Germany (except for East Prussia)	1,750,000,000
Total	\$29,960,000,000

Loss in Production.—One of the major indirect costs of World War I was the loss in production arising from the withdrawal of millions of civilians from commercial pursuits for service in the armed forces. In 1917 there were 38 million men under arms, and it is estimated that an average of 20 million men served in the armed forces during each of the four and one-half years of the war. If we ascribe to these men an average earning capacity of \$500 annually, the estimated loss in production is \$45 billion.

War Relief Costs.—The relief work made necessary by the war is estimated to have cost \$1 billion (Table 5), all of which was raised by voluntary subscriptions.

Table 4—LOSSES OF SEAGOING MERCHANT VESSELS
(In gross tons)

Countries of registry	Lost by enemy action	Lost by marine risk
Allies and Neutrals:		
United States	394,658	430,759
Great Britain	7,756,659	1,143,000
Norway	1,177,001	
Italy	846,333	
France	888,783	
Denmark	240,860	
Sweden	200,829	
Greece	345,516

Turkey	61,470	...
Total	263,976	106,698
Total, all countries	13,007,650	2,390,742
Total, all sinkings		15,398,392

Table 5—WAR RELIEF EXPENDITURES

Countries	Contributions
United States	\$ 625,015,028
British Empire:	
Great Britain	\$87,112,000
Canada	91,750,000
New Zealand	17,585,000
Australia	36,000,000
South Africa	10,000,000
Newfoundland	3,000,000
India	3,600,000
	249,047,000
Other countries	125,937,972
Total	\$1,000,000,000

Cost of War to Neutral Nations.—As shown in Table 6, the estimated cost of World War I to the neutral nations is \$1,750 million, which represents the sums that they expended in guarding their frontiers and in otherwise maintaining their neutrality.

Table 6—COST OF WAR TO NEUTRAL NATIONS

Countries	Expenditures
Netherlands	\$ 672,000,000
Switzerland	250,000,000
Sweden	429,800,000
Norway	130,000,000
Denmark	90,000,000
Other neutral nations	178,200,000
Total	\$1,750,000,000

Total Costs.—In summary, the total of the direct costs and the various types of indirect costs of World War I is as follows:

Value of lives lost	\$ 67,136,942,560
Value of property lost	36,760,000,000
Loss in production	45,000,000,000
War relief costs	1,000,000,000
Cost to neutral nations	1,750,000,000
Total, indirect costs	\$151,646,942,560
Direct costs	186,333,637,000
Grand total	\$337,980,579,560

War Loans.—During the war the United States and Great Britain made substantial loans to their allies, as shown in Tables 7 and 8. In addition, France advanced \$1,547,200,000 to her allies, of which Belgium received \$434,125,090; and Japan loaned \$333,000,000 to Russia.

Table 7—ADVANCES TO ALLIES BY THE UNITED STATES

Countries	Loans
Great Britain	\$4,316,000,000
France	2,852,000,000
Italy	1,591,000,000
Russia	187,000,000
Belgium	341,000,000
Serbia	27,000,000
Czechoslovakia	50,000,000
Greece	43,000,000
Romania	30,000,000
Cuba	10,000,000
Liberia	5,000,000
Total	\$9,452,000,000

Table 8—ADVANCES TO ALLIES BY GREAT BRITAIN

Countries	Loans
France	\$2,170,000,000
Italy	2,065,000,000
Russia	2,840,000,000
Belgium	435,000,000
Serbia	90,000,000
Other Allied countries	240,000,000
British Dominions	855,000,000
Total	\$8,695,000,000

For details concerning the statistics given in this article, as well as for the derivation of the tabulations, consult Ernest L. Bogart, *Direct and Indirect Costs of the Great World War*, 2d ed. (1920), a scholarly work published by the Carnegie Endowment for International Peace, from which these data have been taken.

Head, Department of Military Art,
United States Military Academy.

19. War Casualties

The number of casualties in World War I exceeded by far those of any other war before World War II, in which almost 17 million men of the armed forces perished. Civilian deaths from military action, massacre, starvation, and exposure in the war between 1914 and 1918 are estimated at 12,618,000. Tables 1, 2, and 3 include only casualties in the armed forces.

Table 1—AMERICAN ARMY CASUALTIES
IN WORLD WAR I

Cause of death	Overseas	Domestic	Total
Killed in action	36,926	5	36,931
Died of wounds received			
in action	13,628	45	13,673
Died of disease	23,853	38,815	62,668
Died of accident	2,557	1,946	4,503

WORLD WAR II

As World War II opens with the Nazi attack on Poland in September 1939, German troops advance along a deeply rutted, sandy road toward Warsaw.

Bibliothek für Zeitgeschichte, Stuttgart

WORLD WAR II, the name commonly given to the global conflict of 1939–1945. It was the greatest and most destructive war in history. Whereas military operations in World War I were conducted primarily on the European continent, World War II included gigantic struggles not only in Europe but in Asia, Africa, and the far-flung islands of the Pacific as well. More than 17 million members of the armed forces of the various belligerents perished during the conflict. Its conduct strained the economic capabilities of the major nations and left many countries on the edge of collapse.

The events leading to World War II, its military operations, diplomacy, statistical data, and results, are discussed under the following headings:

1. The War in Brief

Events Leading to War.—At the end of World War I the victorious nations formed the League of Nations for the purpose of airing international disputes, and of mobilizing its members for a collective effort to keep the peace in the event of aggression by any nation against another or of a breach of the peace treaties. The United States, imbued with isolationism, did not become a member. The League failed in its first test. In 1931 the Japanese, using as an excuse the explosion of a small bomb under a section of track of the South Manchuria Railroad (over which they had virtual control), initiated military operations designed to conquer all of Manchuria. After receiving the report of its commission of inquiry, the League adopted a resolution in 1933 calling on the Japanese to withdraw. Thereupon, Japan resigned from the League. Meanwhile, Manchuria had

been overrun and transformed into a Japanese puppet state under the name of Manchukuo. Beset by friction and dissension among its members, the League took no further action.

In 1933 also, Adolf Hitler came to power as dictator of Germany and began to rearm the country in contravention of the provisions of the Treaty of Versailles. He denounced the provisions of that treaty that limited German armament and in 1935 reinstituted compulsory military service. That year the Italian dictator Benito Mussolini began his long-contemplated invasion of Ethiopia, which he desired as an economic colony. The League voted minor sanctions against Italy, but these had slight practical effect. British and French efforts to effect a compromise settlement failed, and Ethiopia was completely occupied by the Italians in 1936.

Alarmed by German rearmament, France sought an alliance with the USSR. Under the pretext that this endangered Germany, Hitler remilitarized the Rhineland in 1936. It was a dangerous venture, for Britain and France could have overwhelmed Germany, but, resolved to keep the peace, they took no action. Emboldened by this success, Hitler intensified his campaign for *Lebensraum* (space for living) for the German people. He forcibly annexed Austria in March 1938, and then, charging abuse of German minorities, threatened Czechoslovakia. In September, as Hitler increased his demands on the Czechs and war seemed imminent, the British and French arranged a conference with Hitler and Mussolini. At the Munich Conference they agreed to German occupation of the Sudetenland, Hitler's asserted last claim, in the hope of maintaining peace. This hope was short lived, for in March 1939, Hitler took over the rest of Czechoslovakia and seized the former German port of Memel (Klaipėda) from Lithuania. There followed demands on Poland with regard to Danzig (Gdansk) and the Polish Corridor. The Poles remained adamant, and it became clear to Hitler that he could attain his objectives only by force. After surprising the world with the announcement of a nonaggression pact with his sworn foe, the Soviet Union, he sent his armies across the Polish border on Sept. 1, 1939. Britain and France, pledged to support

Poland in the event of aggression, declared war on Germany two days later.

As the Germans ravaged Poland, the Russians moved into the eastern part of the country and began the process that was to lead to the absorption in 1940 of Latvia, Estonia, and Lithuania. They also made demands on Finland. The recalcitrant Finns were subdued in the Winter War of 1939-1940, but only after dealing the Russians several humiliating military reverses.

Meanwhile, Japan had undertaken military operations for the subjugation of China proper, and was making preparations for the expansion of its empire into Southeast Asia and the rich island groups of the Southwest Pacific. Mussolini watched the progress of his fellow dictator, Hitler, while preparing to join in the war at a propitious moment.

Military Course of the War.—The bitter struggles and the enormous casualties suffered by Great Britain and France in World War I had engendered in their military leaders a defensive attitude with a reliance on such permanent fortifications as the Maginot Line and on blockade as means of subduing a resurgent Germany. Placing their faith in the impotent League of Nations, both countries neglected the development of armaments and allowed those they possessed and their armed forces to deteriorate. The Germans, on the other hand, smarting under their failure in World War I to capitalize on initial breakthroughs of the Allied lines because of lack of sustained power, developed fast, hard-hitting tank-airplane forces and the strategy of the blitzkrieg (lightning war). Since they had been disarmed by the Allies, they were unencumbered by obsolescent armaments and could equip their forces with the most modern weapons. As a result, initial German operations met with surprisingly rapid success.

In less than a month, Poland had been conquered. There followed an inactive period (dubbed the Phony War) that lasted until April 1940. Then, despite Allied intervention, the Germans quickly seized Denmark and Norway. In May the blitzkrieg struck the western front in all its fury. Within six weeks the British had been driven from the Continent, and the French had been forced to surrender. The speed of the ad-

vance also surprised Hitler, who was not ready to follow his success with an invasion of the British Isles. The Luftwaffe, called upon to soften the islands and gain air superiority while preparations were made for invasion, received a stunning defeat at the hands of the small but highly competent and brave Royal Air Force. Frustrated in the west, Hitler turned against the USSR in June 1941. In a series of brilliant military maneuvers in which several million Russians were captured, he reached the gates of Moscow in December, only to be stopped by bad weather and Russian reinforcements rushed to defend the city.

Meanwhile, Mussolini sought to realize his dream of an Italian Mediterranean empire. In the late summer and fall of 1940 he launched an offensive from Libya against the British in Egypt and an invasion of Greece from Albania (which he had occupied in 1939). Both enterprises eventually proved disastrous for the Italians, and German forces were sent to their rescue. Greece fell to the Germans, but they met stiff British opposition in Africa. In December 1941, Japan thought the time ripe to extend her empire into a Greater East Asia Coprosperity Sphere (see Map 35), which it did very rapidly against meager opposition. It was the Japanese plan to fortify this area so strongly as to withstand American counterattacks and eventually gain a negotiated peace based on the status quo. The attacks on Pearl Harbor and the Philippines brought the United States into the war and greatly altered the balance of power in favor of the Allies.

The year 1942 saw the turn of the tide for the Allies. In June, Japanese naval airpower was decimated by the United States Navy in the Battle of Midway. Having been repulsed at Moscow, Hitler turned to the Caucasus, but the Germans were severely defeated and turned back at Stalingrad (now Volgograd) by the Russians in the closing months of the year. At the same time the British dealt the Germans and Italians a defeat at El Alamein that sent them reeling in retreat westward along the African Mediterranean coast. In Tunisia they encountered newly landed British and American forces and were expelled from Africa in May 1943.

The Allies now had the initiative and, with the vast production facilities of the United States in full operation, took the offensive on all fronts. Resistance was bitter, and progress slow though inexorable. From bases in Africa the Allies invaded and captured Sicily in July–August 1943. In September, Italy was forced out of the war. British, American, and French forces began a methodical and relentless advance up the Italian Peninsula against the Germans, who had been rushed in to defend it. After Stalingrad the Russians, in a series of alternating offensives, gradually forced the Germans back with heavy losses, until by late April 1945 they were approaching Berlin.

Following a massive buildup of troops, air and naval power, and equipment in the British Isles, American, British, and French troops landed on the Normandy coast of France in June 1944 and pressed the Germans back to the West Wall. There, in December, the Germans launched a final counterattack, which failed. Aided by troops landed in southern France from Italy, the Allies forced the Germans back across the Rhine River

and deep into Germany. Assailed on all sides, and their major cities devastated by aerial bombardment, the Germans surrendered on May 7, 1945.

Because of a lack of resources, Allied strategy had envisioned the prior defeat of Germany while remaining on the defensive against the Japanese. Only after victory in Europe would the full Allied power be applied to Japan. American industrial production increased so rapidly, however, that limited offensives could be initiated against the Japanese as early as August 1942. Thereafter, a persistent two-pronged offensive across the Central Pacific and along the Solomon Islands–New Guinea axis steadily pushed the Japanese back. By the fall of 1944, American forces were landing in the Philippines, and they regained the islands the next spring. Then the island of Okinawa, at the threshold of Japan proper, was captured, and preparations were begun for the invasion of the home islands. Meanwhile, the Japanese position in Asia progressively deteriorated. By the summer of 1945, with its navy and air force virtually destroyed, its cities at the mercy of American aircraft, and cut off from sources of supply of much-needed raw materials, the Japanese foresaw doom. The dropping of two atomic bombs on Japanese cities and the Soviet invasion of Manchuria hastened their decision to capitulate, which they did on August 14.

Diplomatic History of the War and Postwar Period.—The League of Nations having failed through inertia and internal discord to prevent war, the major powers aligned themselves in rival groups. In September 1940, Germany, Italy, and Japan signed the Tripartite Pact in Berlin, formalizing the Axis coalition. Hitler's invasion forced the Russians into the Franco-British camp. As the war progressed, the United States departed from its policy of strict neutrality and rendered greater and greater aid short of war to the beleaguered Allies. Blocked in negotiations with the United States from furthering its aims of expansion, Japan attacked the American base at Pearl Harbor in December 1941 and forced the United States into the war.

Meanwhile, in August 1941, Franklin D. Roosevelt and Winston Churchill met on shipboard off Newfoundland and subsequently issued the Atlantic Charter, in which they subscribed to certain general principles for achieving peace. The charter forbade territorial changes contrary to the wishes of the inhabitants; recognized the right of people to choose their own forms of government; promised greater freedom of trade and of the seas; and supported international cooperation to improve conditions of labor and social security. Armaments were to be reduced, and a permanent system of general security was to be created. The aggressor nations were to be disarmed. On Jan. 1, 1942, the United States, Great Britain, France, the USSR, China, and 21 other countries signed in Washington the Declaration by United Nations, pledging mutual assistance and promising not to enter into separate armistice or peace negotiations with the Axis powers. The member nations also subscribed to the Atlantic Charter's purposes and principles.

At the Casablanca Conference in January 1943, Roosevelt and Churchill—most probably to allay Joseph Stalin's suspicions of the loyalty of his allies—proclaimed a policy of unconditional surrender for Germany, Italy, and Japan as the only means of maintaining the peace. This policy may have prolonged the war, but it solidified the

¹ The term "British," as applied to military forces, includes where appropriate other Commonwealth forces—Canadian, Australian, New Zealand, South African, and Indian—which performed outstandingly during the war.

Allied nations and may have forestalled Soviet efforts toward a separate peace with Germany in 1943.

At the Teheran Conference in late 1943, Roosevelt, Churchill, and Stalin agreed on broad principles of operation for an international organization to mediate differences between nations and maintain peace. At Dumbarton Oaks in Washington in the fall of 1944 details were worked out, and it was decided to call the new organization the United Nations. The San Francisco Conference convened on April 25, 1945, to organize the United Nations; its charter was adopted unanimously on June 26.

War's end found the United States and the USSR the two greatest powers in the world. By the time of the signing of the Axis satellite treaties early in 1947, the two countries were drawing apart. Friction over the treaties with Austria, Germany, and Japan and Soviet aggressive designs in eastern Europe brought increasing tension, and by the end of 1948 their relationship could be considered one of cold war. In 1950 armed conflict arose in Korea between Soviet-backed Communist forces and United Nations forces led by the United States. The cold war between the East and West continued thereafter, with the Communists striving for world domination through subversion and infiltration, and the West seeking to frustrate their designs.

2. Between World Wars

After World War I representatives of the victorious powers met in Paris to devise a peace settlement that would protect future generations from another such conflict. All agreed that a new framework or system was needed in international relations. Each power, however, had different views as to what that framework should be. From their compromises emerged treaties of peace, the chief of which was that with defeated Germany signed at Versailles on June 28, 1919. Based on the assumption that Germany and her allies had been the disturbers of the status quo, these treaties attempted to place curbs on their future actions. Articles 160, 180, 181, and 198 of the Treaty of Versailles, for example, forbade Germany to have an army of more than 100,000 men, a fleet of more than 36 combatant vessels, or any submarines or military or naval aircraft, or to maintain fortifications or military installations within 50 kilometers of the east bank of the Rhine. In addition, the defeated states were to be required to pay large sums as reparations for damages that the victors had suffered during the war.

But these punitive clauses were not supposed to form the keystone of the new system. That was to be the League of Nations, the organization whose Covenant was incorporated in the Treaty of Versailles and in the treaties of St. Germain-en-Laye with Austria, of Neuilly with Bulgaria, of Trianon with Hungary, and of Sèvres with Turkey (superseded by the Treaty of Lausanne). With the victorious nations as the original members of the League and with provision for the admission of other states, including eventually even the Germans and those who had been on their side, its Assembly was expected to provide a forum for the airing of all international

issues. In the event of any aggression by one state against another or any breach of one of the peace treaties, its Council was to mobilize all members, large and small, for a collective effort to keep the peace.

Neither the punitive clauses of the treaties nor the Covenant worked out quite as their authors had hoped. Although the Germans complied with most of the restrictions imposed on them, they recovered rapidly in relative strength. At Rapallo on April 16, 1922, they signed with the other outcast of Europe, the Bolshevik USSR, a treaty providing for mutual renunciation of claims and future economic cooperation. The victors meanwhile fell out. The British and French disagreed about Middle Eastern issues and about the amount of reparations that should be exacted from Germany. So sharp did their exchanges become that by 1923 it was commonly assumed that if there were another war it might well be one between Britain and France. As for the United States, its Senate declined to ratify the Treaty of Versailles; it took no part in the League and withdrew into self-imposed isolation, denying that it bore any responsibility for the maintenance of peace in Europe.

By the latter part of the 1920's, the guarantees of peace were somewhat different from those that had been envisioned in 1919. The articles of the Treaty of Versailles designed to keep Germany in check were supplemented by defensive alliances between France and certain of Germany's eastern neighbors: Poland (Feb. 19, 1921) and the nations of the Little Entente, Czechoslovakia (Jan. 25, 1924), Rumania (June 10, 1926), and Yugoslavia (Nov. 11, 1927). At a conference held in Locarno on Oct. 5-16, 1925, the German government entered into treaties (signed in London on December 1) with France, Britain, Belgium, and Italy, guaranteeing the existing Franco-Belgian-German frontiers. On Sept. 8, 1926, Germany was admitted to the League. The peace thus rested on three sets of undertakings: the pledges of mutual support between France and her allies, the guarantees exchanged at Locarno, and the promises of collective action made by those nations that subscribed to the Covenant. Events of 1931 and later years were to prove all these safeguards frail.

BREAKDOWN OF THE VERSAILLES SYSTEM

Manchurian Incident.—On Sept. 18, 1931, a small bomb exploded underneath a section of track on the South Manchuria Railroad. The Japanese Army, which under long-standing agreements policed the railroad, used this incident as a pretext for launching operations aimed at conquering all of Manchuria for Japan. The Chinese government, which had nominal sovereignty over the area, protested to the League of Nations. Some supporters of the principle of collective security saw an opportunity for the League to prove that it was capable of stopping an aggressor. The majority of member governments, however, did not, feeling that the fate of Manchuria was not of vital concern to them, or that the Japanese had some justice on their side, or that action by the League might harm moderates in Tokyo who were trying to hold the army in check. In the upshot the Council passed two resolutions, one on September 30 and the other on October 23,

urging the Japanese to cease their military operations and enter into direct negotiations with China and appointing a special commission to investigate the situation and help the parties reach a settlement.

Paying little attention to the League's advice, the Japanese continued their operations. When the Chinese organized a boycott of Japanese goods, they went even further. Reinforcing the garrison which they already maintained at Shanghai, in January 1932 they seized control of that city. By May they had been persuaded by League mediators to reach a truce agreement with the Chinese in Shanghai, from which their forces were gradually withdrawn. In the meantime, however, they had convened in Manchuria a rump assembly and had it proclaim the independence of the region, now to be called Manchukuo, on February 18. The new state, which came into existence officially on March 1, signed with Japan on September 15 a treaty making it a virtual ward of that country.

The first Western nation to show umbrage over these events was the United States. Despite its isolationism it had a long tradition of interest in the Far East. When the League Council convened to hear the Chinese protests, the American government sent an official observer to Geneva. The view in Washington at that time was that Western powers ought not to do anything that might aggravate the political situation in Tokyo, but Secretary of State Henry L. Stimson subsequently became convinced that there ought to be some general assertion of opposition to Japanese aggression. Although himself in favor of threatening Japan with collective sanctions, he had to reckon with the stubborn pacifism of President Herbert Hoover. The most that he could do was, on Jan. 7, 1932, to dispatch a formal note to Tokyo, declaring that the United States would not recognize Japanese sovereignty over territory acquired by force. This formulation was termed variously the Stimson Doctrine and the Hoover Doctrine. Although one of the arguments used by opponents of League action had been the fact that the United States was not a member of the organization, the American initiative attracted little immediate support. When asked by Stimson to make a similar declaration, the British government declined. Not until after the evacuation of Shanghai did British statesmen even suggest that the League might adopt the Stimson Doctrine as its own.

The sessions of the League Assembly in the fall and winter of 1932-1933 were devoted largely to the Manchurian issue. The commission of inquiry, headed by the 2d earl of Lytton, made its report, stating that while the Japanese had possessed some grievances their action had been excessive, that the establishment of an independent Manchukuo had not been in accordance with the wishes of the people, and that Japanese forces ought to return the rail lines, restore the *status quo ante bellum*, and negotiate a new understanding about Manchuria with the Chinese. After prolonged debate the Assembly adopted on Feb. 24, 1933, a resolution refusing to recognize Manchukuo and calling on the Japanese to retire. The only result was to bring on March 27 the resignation (effective in two years' time) of Japan from the League of Nations. The system of collective security created by the Paris peace treaties had been tested and been found wanting.

Economic Issues.—In the meantime, a severe economic depression had developed. A crash of the New York stock market in October 1929 had been followed by a rapid decline in American production, employment, and foreign commerce. The repercussions were soon felt in all countries that traded with the United States and also in those where American funds were invested. So far flung was the network of American commercial and financial relationships that by 1931 people were speaking of a world depression.

It had soon become clear that most European governments would be unable to continue making payments on World War I debts. Ever since the early 1920's, British statesmen had been urging that the United States forgive all or part of what was owed by her wartime allies, proposing that they in turn remit some or all of the payments due them from Germany as reparations. The American government had rejected this proposal, but in 1931, faced with the depression, President Hoover relented and arranged for a one-year moratorium on both debt and reparation payments. Seeking reelection in 1932, he dared not repeat the experiment. Some of the debtor states were forced to default. In the end all but Finland did so, and the result was not only to embarrass the governments involved but also to strengthen isolationist feeling in the United States.

Eventually almost all the affected states sought solutions for their economic problems in independent, nationalistic action. Seeking a commercial and financial advantage over other countries, the British abandoned the gold standard and devalued the pound in 1931. Through agreement reached in a conference held at Ottawa on July 21-Aug. 21, 1932, they also abandoned the tradition of free trade and established preferential tariffs for the Commonwealth. The American government deserted the gold standard in 1933 and in the same year caused the failure of the London Monetary and Economic Conference by declaring that it would not join in an agreement to stabilize exchange rates. Fascist Italy adopted more drastic measures, instituting rigid economic controls and creating jobs by enlarging the armed forces and accelerating weapons production. Germany, which was ruled after Jan. 30, 1933, by the National Socialist (Nazi) dictator Adolf Hitler, went even farther in the same directions. The community of nations envisioned in the Paris peace treaties dissolved into an anarchy of jealous states seeking national advantage and national self-sufficiency.

See also REPARATIONS.

Rise of Hitler.—By far the most ominous event of these depression years was the emergence of Hitler in Germany. A psychopathic personality, he rejected all conventional moral standards. In his book *Mein Kampf* (2 vols., 1925-1927, q.v.) and in later speeches he had disclosed his abhorrence of such concepts as equality and majority rule, his hatred of Jews, his belief that "Aryans" were a "master race" entitled to dominate others, and his conviction that the state had a right to use any means to achieve its ends. He had also set forth his views on foreign policy. He held that Germany should expand in order to bring within it all Europeans of German nationality. Saying also that the German people needed *Lebensraum* (space for living), he indicated that it was to be found in eastern Europe. At the same time he declared that Germany had to have "a final active reckoning with France."

His words showed that he desired German hegemony over Europe and would have no scruples about the methods he used.

The other nations of Europe viewed him with alarm but also with uncertainty. Few could believe that he really meant what he said, or that once in office he would not become more restrained, more conventional, and more prudent. At first his actions justified this opinion. While he carried out the domestic programs he had advocated, succeeding soon in abolishing all but the forms of democracy and constituting himself *fuhrer* (leader) of the German people, externally he followed courses somewhat at odds with what he had said and written. In token of peaceful intentions he even negotiated with Poland an agreement relating to the large German minority in that country. In a joint declaration issued on Jan. 26, 1934, the German and Polish governments promised for a period of 10 years not to resort to war to solve differences and not to intervene in behalf of members of their nationality groups who were not legally citizens of their states.

Until the summer of 1934 the only actions of Hitler that excited international apprehension were those concerning armaments. As part of the campaign to revive the German economy, he undertook to increase production by heavy industry, particularly those branches that would make the greatest contributions to a war effort. In May 1933, he asked the other League powers to allow Germany to move immediately toward the "equality" which had been promised her for the distant future. The French refused, pointing out that the promise had always been conditioned on the development of effective international controls. Hitler replied by declaring on October 14 that Germany would proceed to arm herself with or without consent. He announced on the same day his nation's withdrawal (effective in two years' time) from the League of Nations. But the effect of these actions was softened by an offer to France of a bilateral pact in which Germany would agree to limit its army to 300,000 men and its air force to 50 percent of that of France and to accept some measure of international control. Although the French refused this offer, taking the position that they should not sanction German rearmament even in principle, the fact that the offer had been made left it unclear whether or not Hitler was bent on carrying out the external programs outlined in *Mein Kampf*.

The first strong indication that this might be the case came in July 1934 in Austria. That country had a National Socialist Party modeled on Hitler's and more or less openly supported by German officials. In the spring of 1934, the party increased its agitation. Then, when Chancellor Engelbert Dollfuss was assassinated on July 25, it attempted a coup d'état. German official statements and troop movements made it seem that the coup would have active support from across the frontier. The Austrian Nazis had, however, overestimated their strength. Dollfuss' successor, Dr. Kurt von Schuschnigg, quickly consolidated his power. Italian dictator Benito Mussolini meanwhile declared that Italy would not tolerate a change in the status of Austria and moved Italian troops to the Brenner Pass. Whatever plans the Germans had were frustrated by these actions.

See also NATIONAL SOCIALIST (NAZI) PARTY.

Stresa Front.—The French became increasingly apprehensive as evidence accumulated to indicate that Hitler planned much more formidable forces than those of which he had spoken in October and November 1933. On March 10, 1935, one of his officials disclosed that the projected German Air Force would be larger than the French. Six days later, Hitler himself proclaimed the reinstitution of compulsory military service.

To cope with the prospective peril, the French had begun to mature a strategy. Foreign Minister Louis Barthou summarized it as an effort "to group the European interests that could be menaced by the rapid revival of Germany." Although Barthou was assassinated at Marseille on Oct. 9, 1934, in company with King Alexander I of Yugoslavia, his policy was carried on (albeit somewhat irresolutely) by his successor, Pierre Laval. To begin with, in January 1935, Laval held formal conversations with Mussolini, seeking a common Franco-Italian front. These conversations were welcomed by the Italian dictator. Soon after the emergence of Hitler he had proposed that Italy, France, Great Britain, and Germany agree to procedures by which they alone, bypassing the League of Nations, might revise the Treaty of Versailles. The French and British had declined, and the resultant Four-Power Pact initialed at Rome on June 7, 1933 (signed on July 15), provided for nothing more than consultation on matters of mutual interest. Now the growth of French apprehension about Hitler gave Italy more leverage.

Mussolini's principal aim was to circumvent the provisions of the League Covenant that might give protection to Ethiopia, for he had been trying unsuccessfully since the early 1920's to make that nation an economic colony of Italy, and at some point before 1933 he had decided to attempt its forcible conquest. He feared that, since Ethiopia had been admitted to the League in 1923, it might be able to win that body's support, but he recognized that if the British and French did not join in collective resolutions and sanctions, these would be ineffectual. A clash between Italian and Ethiopian troops at the watering hole of Wal Wal on Dec. 5, 1934, had just given him a potential *casus belli*. To Ethiopia's appeal for League arbitration he had rejoined that he would settle the incident exclusively in Italy's interest. Now the trip of Laval to Rome, seeking Italian support against Hitler, gave him the opportunity to bargain for the acquiescence of France and perhaps, through France, of Britain.

The formal convention signed by Laval and Mussolini on Jan. 7, 1935, said nothing about Ethiopia: it merely resolved certain issues with regard to French and Italian colonies already existing in Africa. Mussolini declared later, however, that Laval had given him verbal assurance of a free hand in Ethiopia, and Laval himself admitted that he had promised not to interfere with Italian economic penetration there. The Frenchman professed not to have made any commitment with regard to political or military penetration, but what was said and left unsaid gave Mussolini warrant for interpreting the conversations as he did, and he accelerated preparations for war, apparently much less concerned now about interference by the League.

Laval had gotten what he had sought. Another convention, signed on the same day, affirmed that France and Italy would jointly keep watch on

events in Austria and confer about common action if that nation were imperiled, and it was agreed that Mussolini should invite the British to a meeting at Stresa, with the object of adding them to the anti-German front. This conference, held on April 11-14, 1935, was a partial success. All three governments joined in a commitment to oppose, "by all practicable means, any unilateral repudiation of treaties which may endanger the peace of Europe." While this commitment was qualified by a provision requiring the use of League machinery, it seemed a direct warning to Hitler. The Stresa declaration was followed, moreover, by action to open a League debate on the question of whether or not Germany's reinstitution of compulsory military service constituted a unilateral breach of the Treaty of Versailles. On April 17, the Council, with only one abstention (that of Denmark) voted in principle its condemnation of all unilateral violations of treaties and referred the German case to the Assembly.

Meanwhile, Laval began negotiations with the ambassador of the USSR in Paris. On May 2, they announced the signature of a five-year pact pledging mutual assistance in the event that either nation was the victim of aggression. This was followed on May 16 by a similar pact between the Soviet Union and Czechoslovakia. Coupled with the earlier treaties that allied Poland and the Little Entente with France, these accords seemed to close the ring around Nazi Germany, and they were accompanied by movements within all the major European governments to increase spending on armaments. In June 1935, the French ambassador in Berlin, André François-Poncet, reported the German leaders to be more "defeated and discouraged" than he had ever seen them.

Anglo-German Naval Agreement.—The so-called Stresa front was short lived. Some members of the British government reacted to the evidence of German rearmament by drawing the moral that the nation should detach itself and avoid such enforced involvement in war as that of 1914. Finding the German government full of protestations of goodwill for Britain, members of this group reasoned that the course of prudence was to eliminate all potential Anglo-German issues. One that had embittered relations between the two countries in pre-World War I years had been naval rivalry, and when the Admiralty reported exchanges with the Germans that revealed the possibility of a bilateral compact on the relative size of the two fleets, considerable official sentiment developed in favor of following it up. This was done, though in the most closely guarded secrecy, and on June 18, 1935, a naval pact with Germany was signed. It provided that Germany could build a fleet of capital ships equal in tonnage to one third, and a fleet of submarines equal to 60 percent, of that of the Royal Navy. In view of the fact that the Treaty of Versailles had set other limits on German naval strength and had forbidden the construction of submarines, these terms constituted acceptance by Britain of Germany's repudiation of those articles. Coming barely two months after the Stresa accords, this pact gave evidence that the nations apparently joined against Germany were in fact far from united.

Nor did the Franco-Soviet accord prove more durable. Laval had always doubted the wisdom of the Barthou policy and inclined toward the

view that France might be better off in league with Germany than against her. On Jan. 13, 1935, the plebiscite promised by the Treaty of Versailles had taken place in the Saar, with more than 90 percent of the voters opting for reunion with Germany, and Laval not only accepted the verdict with good cheer but made the point to diplomats that France would not necessarily be intransigent in all matters that affected Germany. Instead of seeking prompt ratification of the Franco-Soviet Pact by the French Parliament, he held it over (it was carried through that body by his successor, Albert Sarraut, in February 1936), meanwhile evading all suggestions from the Soviet capital of a military convention to supplement it and to make clear how it might be carried out. The Soviets were pressing Laval onto delicate ground, it is true, for a military convention would involve such issues as whether or not Soviet troops could move across Poland or Rumania, and Laval, who had become premier on June 7, 1935, was looking forward uneasily to a national election and to the possibility that the opposition Popular Front, of which the Communists were part, might profit from a closer Franco-Soviet tie. Nevertheless, his hesitations provided further evidence that the unity of Europe against Germany might be an illusion.

Italo-Ethiopian War.—Although the British at Stresa had given Mussolini no assurances that they would acquiesce in his conquest of Ethiopia, their reticences had been so interpreted by him and he was strengthened in this view when, in June 1935, Anthony Eden, minister for League of Nations affairs, came to Rome to suggest that Britain might cede to Ethiopia part of British Somaliland so that Ethiopia might in turn appease Italy by ceding to it some land adjacent to Italian Somaliland. Eden even suggested that a way might be found to make Ethiopia a virtual economic protectorate of Italy. Mussolini soon learned that these gestures did not necessarily mean what he thought. When he rejected Eden's proposals and continued preparations for war, the British government moved warships into the Mediterranean Sea as if in preparation for a League vote of sanctions against Italy. On September 11, after Foreign Secretary Sir Samuel Hoare addressed the League Assembly and declared firmly that Britain would be "second to none" in fulfilling her obligations under the Covenant, Mussolini was faced with the very contingency that he thought his diplomacy had prevented: the possibility of League intervention in behalf of Ethiopia. He nevertheless moved forward. When Emperor Haile Selassie ordered Ethiopian mobilization on September 29, he responded by proclaiming national mobilization in Italy. On October 3, his armies attacked from Eritrea and thus opened war.

In Geneva the League Council immediately heard the protests of Haile Selassie's representative. On October 7, with Italy alone abstaining, it voted to condemn Mussolini's aggression as a resort to war in defiance of Article 12 of the Covenant. Referred to the Assembly, this resolution on October 11 won the support of 50 of the 54 members, only Italy and her client states, Albania, Austria, and Hungary, opposing it. It remained for a Coordination Committee of the League to determine what sanctions should be imposed. Here practical rather than moral issues arose, for, as a totalitarian state that had endeavored for more than a decade to achieve national self-

efficiency, Fascist Italy could withstand almost all forms of moral and economic pressure. The only sanctions that would do it serious injury would be closure of the Suez Canal, which would block the sending of reinforcements and supplies, and stoppage of the one vital commodity that Italy had to import in quantity, oil.

Fearing that closure of the canal would lead to war with Italy, the British government, which controlled the waterway, had little inclination to take that step. As for oil, it was doubtful whether a League decree could be effective in view of the fact that the leading producer, the United States, was not bound by the Covenant. Although Congress had enacted a so-called Neutrality Act signed on Aug. 31, 1935), which required embargoes to be laid on exports of munitions to nations at war, it did not apply to petroleum products. While President Franklin D. Roosevelt declared on November 15 that oil and other commodities were "essential war materials" and ought to be included, there was no assurance that American exporters would adopt such a "moral embargo," or that if they did not, Congress would amend the law to cover these items. The American government encouraged the League powers to expect cooperation but could not guarantee it.

When the Coordination Committee brought in its report on October 19, it made only five relatively mild recommendations for sanctions against Italy: embargoes on shipments of arms to her; bans on loans and credits; bans on imports from her; embargoes on exports to her of transport animals, rubber, and a variety of metals; and joint aid to nations that suffered economically as a result of taking these steps. Voted on separately in the Assembly, they were approved by majorities respectively of 50, 49, 48, 48, and 39. Since their practical effect would be slight, the chief hope was that the display of unity in world opinion would impress Mussolini and cause him to change his course. It did not.

Hoare-Laval Plan.—As Italian military operations continued, sentiment grew, especially in Britain, for more effective action. Between January and June 1935, a so-called Peace Ballot, a national referendum supported by the British League of Nations Union and allied groups, had yielded 6,784,368 votes endorsing the principle that, if one nation insisted on attacking another, the other nations should combine to employ not only economic but also military sanctions (10,027,608 favored economic sanctions alone). Although this total encompassed a substantial percentage of the electorate, the result had been discounted by most politicians on the ground that the ballot had probably not been understood fully by its signers. Now, however, they began to consider that it had been more significant. Campaigning in a general election, spokesmen for the government felt obliged to use increasingly vigorous words in speaking of what Britain and the League would do. Returned on November 14 with an overwhelming majority of seats in the House of Commons (431 to 184), the Conservative cabinet was under pressure to live up to its promises.

Those ministers who were dubious about the whole policy of sanctions found this pressure especially onerous. They urged a further effort to induce Mussolini to abandon the war and thus, they hoped, to rescue Britain from the predicament in which she was likely soon to find herself. Precisely what was said and agreed on within the cabinet remains unknown. The result was, how-

ever, that Hoare set off in early December for a skating holiday in Switzerland, and that he paused for two days (December 7-8) in Paris for intensive conversations with Laval. The result of these conversations was an agreement on proposals to be made secretly to Mussolini. He was to be asked to halt the war with the understanding that Italy would receive from Ethiopia the northeastern section of the Tigre, part of the desert of Danakil, all of the Ogaden region, and "exclusive economic rights" in the country south of 8° north latitude and east of 35° east longitude. All that Italy would yield in return would be a corridor giving Ethiopia a camel track to the sea across almost impassable desert. This plan offered Italy almost everything that she could hope to obtain by continuing her campaign.

Convinced that the application of further sanctions would lead to a general war harmful to French interests, Laval had devised these terms. He had also developed the strategy to be followed. The plan was to be put before Mussolini first. After he accepted, it was to be shown to Haile Selassie. When the Ethiopian ruler rejected it, the French and British would be able to say that he had refused peace, and could not only oppose the imposition of further sanctions but also call for the lifting of those that had already been voted. Whatever the outcome for Ethiopia, the crisis between the League powers and Italy would have been bridged, and some facsimile of the Stresa front might be put together again. Even before they could be put into diplomatic cables, however, the terms of the plan leaked to the press. From partisans of Ethiopia and the League there arose an instant and loud outcry. The British and French governments were accused of preparing to betray the interests of a small nation, to sacrifice the principle of collective security, and reward an aggressor. So strong was feeling in Britain that Prime Minister Stanley Baldwin felt compelled on December 18 to request Hoare's resignation and soon afterward to appoint as his successor Eden, the champion of the League. In France, Laval's government barely survived a vote of confidence in the Chamber of Deputies on December 29. From the United States, where sentiment for effective embargoes had been rapidly growing, came a torrent of criticism of British and French shortsightedness.

Mussolini had meanwhile given indication that he would not in any case accept less than the total conquest of Ethiopia. In January 1936, there was discussion within the League of adding an oil embargo to the sanctions. Despite the events that had followed the release of the Hoare-Laval terms, however, official French and British opinion was still opposed to such action. The decision was for delay, pending the outcome of Roosevelt's efforts to amend the American neutrality laws. Since nothing encouraging was done by Congress, nothing at all was done by the League. As it turned out, the limit of its capacities had been reached in the vote of sanctions of October. As winter turned into spring, the Italian offensive in Ethiopia gained momentum. On May 5, 1936, Fascist troops marched into the capital, Addis Ababa. Four days later, Mussolini proclaimed the war ended and Ethiopia part of Italian East Africa. By summer most of the League powers had concluded that they could only accept as a fact the extinction of Ethiopian sovereignty, and the Assembly agreed that sanctions against Italy should be suspended as of July 15. The League's

On March 7, 1936, troops goose-step into Cologne as the demilitarized zone of the Rhineland is reoccupied by German forces in violation of the Treaty of Versailles.

Wide World

machinery for maintaining collective security had proved ineffectual.

Rhineland Coup.—An even more significant demonstration of this fact came before the Italo-Ethiopian War was liquidated. Seeing the split within the Stresa front, Hitler decided to act in the Rhineland—to repudiate the articles of the Treaty of Versailles that declared that region permanently demilitarized. When he communicated this decision to his generals, they were appalled. In their view the German Army was still comparatively weak, and the air force had relatively little offensive capability. They warned the führer that the French had the power single-handedly to drive a German force from the region and impose humiliating terms. Hitler's response was a simple assertion that the French would not move. He ordered the requisite preparations made.

The legal pretext he found in the Franco-Soviet Pact of 1935. By committing France to act against Germany in the event of German aggression against the USSR, Hitler could argue, this pact constituted a repudiation of the Locarno treaties, in which France had promised never to make war on Germany except in obedience to resolutions by the League of Nations. It also constituted a threat to Germany, he could say, and therefore, despite the Treaty of Versailles, gave warrant for action in self-defense. On March 7, 1936, shortly after the French Assembly's ratification of the Franco-Soviet Pact, he exposed this reasoning in diplomatic notes and in a speech to the Reichstag. He announced that German troops were moving into the demilitarized zone. At the same time, he offered as measures of reassurance to sign nonaggression pacts with France and all Germany's neighbors, east as well as west; to concert with the French a new demilitarization agreement, applying to both sides of the frontier; and to reenter the League of Nations.

The French government was shocked. Premier Sarraut responded with a forceful radio address, declaring, "We shall not leave Strasbourg under the German cannon." As he later testified, however, he and his colleagues were uncertain as to what they would in fact do. Reports by military men on France's capacity to repel the German force were generally pessimistic. The army, they said, was inadequate. It would be necessary to call up reservists in order to fill its ranks. Overestimating the German bomber force, they warned that Paris and other centers lacked the air defenses to prevent devastating raids. Their judgments thus reinforced the feeling that had been instinctive among the principal members of the cabinet

—that France dare not act alone, and that perhaps she should not act even if she received support from abroad.

One capital with which they were particularly concerned was Warsaw. On the day of Hitler's announcement the Polish government gave them reassurance that in the event of a clash it would stand by the alliance of 1921 and proposed immediate conversations. Two days later, on March 9, however, it declared that it accepted the German thesis and regarded the reoccupation of the Rhineland as a legitimate response to the Franco-Soviet Pact. Their objective may have been merely to emphasize that Polish support of France would constitute action above and beyond the 1921 treaty, but the impression given the French government was that the Poles were playing a double game, and that France could not rely on them. The other nation whose support would be crucial to the French in a clash with Germany was Great Britain, and while the British government was more forthright than the Polish, it gave France even less encouragement to stand fast. Eden declared the German action to be inexcusable but not threatening, especially in view of Hitler's offer of nonaggression pacts. Calling for a meeting of the League Council, he said that no decision should be taken beforehand by any government. The only promise he made was that Britain would support France if she were attacked by Germany in the period before the League acted.

The French government was thus informed by its two most important allies that it could not expect backing if it replied to the Germans with force. Some members of the Sarraut cabinet found this news not unwelcome. Perhaps most did, for they faced a general election in May: they felt that a call-up of reservists would cost them votes; and, in view of the identification of their Popular Front opponents with antifascism, they feared that any crisis with Germany might have the same effect. The French press, also preoccupied with domestic affairs, raised little clamor for action. Consequently, on March 11, Sarraut backed away from his earlier position, announcing that the cabinet had decided to seek a solution within the framework of the League of Nations, working in conjunction with the other signers of the Locarno Pact. The League did in fact discuss a resolution condemning the German action. Nothing came of this discussion, however, and the Rhineland question was lost to sight in the pell-mell rush of other events. Hitler's coup had succeeded. Not only the machinery of the League but also the French system of alliances lay in

ruins. There were no longer any collective guarantees of the peace, and the end of the truce of 1918-1919 was in sight.

END OF THE LONG ARMISTICE

Spanish Civil War.—Hardly were the Ethiopian and Rhineland crises out of mind when a new storm swept the stage. In Spanish Morocco on July 17, 1936, so-called Nationalists launched a revolution against the Popular Front government of the five-year old Spanish Republic (garrisons in Spain proper rose the next day). Championing ideas much like those of the Fascists and Nazis, they applied immediately to Rome and Berlin for aid. The republicans or Loyalists (as they became known) with equal alacrity applied for help to Paris, where the May elections had given victory to the Popular Front and made Leon Blum, a Socialist, premier in June. From the outset the Spanish Civil War was a European problem.

Italy and Germany both agreed promptly to act. Italian ships and planes were soon aiding Nationalist troops to cross from Morocco to the Iberian Peninsula, and before long Italians and Germans were actually fighting in the Nationalist ranks. On November 28, Mussolini signed with the Nationalist leader, Gen. Francisco Franco, a pact providing that Italian aid should be recompensed by economic cooperation, political cooperation in the western Mediterranean, and "benevolent neutrality" on the part of Spain in a general war. Later, on March 20, 1937, Hitler entered into an agreement with Franco that promised consultations in the event of a European war and guaranteed the export to Germany of quantities of Spanish provisions and raw materials.

At first the French government was disposed to give aid to the republicans, and, indeed, Premier Blum immediately authorized sales of aircraft and munitions. But counsels of caution soon came to the fore. With little of the regular army loyal to it, the Spanish Republic seemed unlikely to survive. Since the Spanish Popular Front was somewhat more radical than the French, its cabinet was viewed askance by some members of the Blum government. Officials of the Ministry of Foreign Affairs warned furthermore that assistance to the republicans would probably lead to increased Italian and German assistance to the Nationalists, and that the eventual outcome might well be a general European war. This last consideration was pressed on the French by their British allies. Many in the majority Conservative Party felt that Britain's position should be "a plague o' both your houses." While most Liberals and Labourites praised the republic and damned the Nationalists, few argued that British interests were involved in the civil war. The Baldwin cabinet therefore had mass support in adopting the position that the aim of the democracies should be to quarantine Spain and prevent the conflict from spreading.

Torn within and under pressure from London, the Blum cabinet decided to take a similar stand. On Aug. 1, 1936, it proclaimed a policy of non-intervention, declaring that the Spaniards should be allowed to fight out their war without aid in men or matériel from any other country and asking all other governments to join in this course. A total of 27 nations, including Italy and Germany, agreed, and an international Nonintervention Committee was established in London to keep watch on the fulfillment of these pledges.

In actuality the committee never proved effective. The Italians and Germans continued more or less openly to assist Franco, and the Soviet government, despite its promise to the contrary, contributed men and supplies to the republicans. Even the French wavered from time to time, leaving the Pyrenees frontier open on two occasions (in November 1937 and April-May 1938) for shipments to the republic. Among the European powers only Britain was faithful to the pledge. The United States, though not a party to it, followed the British by applying its neutrality laws to the civil war. Partly because Soviet and French aid to the republic was considerably less than Italian and German aid to the Nationalists, partly because of military advantages on Franco's side, and partly because of divisions among the Loyalists, the Nationalists eventually triumphed. By the end of March 1939, Franco was master of nearly all of Spain.

The Spanish conflict was not the match that touched off a new world war. It did, however, make tensions more acute. Even among those in Britain, France, and the United States who continued to regard nonintervention as a wise policy there were some who felt that Spain represented one more victory for the totalitarian states, and that this fact brought nearer the moment when their career of success would have to be checked. Among the Italians and Germans it strengthened the illusion that the democracies were weak willed and would not resist.

Sino-Japanese War.—As the Spanish Civil War rounded out its first year, a crisis arose in another part of the globe. Ever since they had created the satellite state of Manchukuo, the Japanese had been discussing further steps toward national expansion. Moderate factions had advocated the use of peaceful means, particularly the application of economic pressure to China, coupled with efforts to induce the Chinese government to accept a client status. These measures had, however, been only partially successful. Extremist groups had become increasingly restless, and the government had edged steadily toward a more forceful policy.

On April 18, 1934, the official spokesman for the Foreign Office, Eiji Amau, announced that any effort by a Western power to aid China would be opposed by Japan. In effect, this declaration was a Japanese Monroe Doctrine for eastern Asia. In December, Japan gave notice that she would no longer be bound by the Washington Naval (Five-Power) Treaty of 1922, which had stipulated that Japanese tonnage in capital ships should not exceed three-fifths that of Britain or the United States. After attempting unsuccessfully in 1935 to arrange for the secession of the northern provinces of China and the establishment there of another satellite state, the Japanese government on Aug. 11, 1936, devised a new statement of "fundamental principles of a national policy," declaring Japan's destiny to be the dominating force in all of eastern Asia.

Most of the powers with interests in the Far East failed to respond with any vigor. The United States contented itself with mild diplomatic protests, and while the British spoke of extending help to China, they made no move to do so. Only the Soviet Union acted in such a way as to indicate that it might at some point resist a Japanese advance. On March 12, 1936, it signed a mutual defense pact with its client state, Outer Mongolia (Mongolian People's Republic). More important,

Soviet dictator Joseph Stalin advised the Chinese Communists to make peace with the central government and form a common front. Faced with these gestures by the USSR, the Japanese government seized on a proposal from the Germans and on November 25 signed with Hitler an Anti-Comintern Pact. This agreement stipulated nothing more than that the two governments exchange data about, and collaborate in suppressing, Communist activities. Inevitably, however, other governments suspected that it contained secret articles making the two nations allies. The result in both London and Washington was to quicken apprehension concerning possible Japanese aggressive moves. In April 1937, the British government began belatedly to supply financial and technical assistance to China, and American officials talked openly of doing likewise.

Rising prospects for foreign support of China, coupled with various domestic developments, led the Japanese government to decide that it could no longer achieve its objects by peaceful means. On July 7, 1937, taking advantage of a minor clash at the Marco Polo Bridge near Peiping (Peking), the Japanese Army opened a large-scale invasion of China. The other powers still did not act. Britain and the United States delivered diplomatic protests, and on October 6 the League Assembly voted to condemn Japan's action but not to brand it as aggression and not therefore to invoke sanctions. Speaking at Chicago on the previous day, Roosevelt had said that an "epidemic of world lawlessness" was spreading and suggested that, as with an epidemic disease, it might be met by a "quarantine." It soon became clear, however, that he would not go on to advocate combined action against Japan. Instead a meeting was called in Brussels of the 18 nations that had adhered to the Nine-Power Treaty, signed in Washington in 1922 and promising respect for the sovereignty, independence, and territorial and administrative integrity of China. From this meeting issued, on November 24, nothing more

than an exhortation to Japan to mend her ways. The Soviet Union for its part was caught up in a domestic crisis, the result of which was a purge of the leading generals in the army. In August 1938, its forces did engage in a 10-day skirmish with Japanese troops that had infringed the Soviet border. Aside from sending a trickle of aid to the Chinese, however, no power did anything more.
